This was a step in the right direction, and it was decided further that a systematic course of education to help these men become citizens should be established. Ninety per cent were not citizens. More than 30 per cent could not speak English—75 per cent could not read, and 25 per cent could not read or write their native language. Ages ranged from eighteen years to sixty years, with an average of thirty-six years.

An experienced instructor was engaged and was assisted by men in the organization. Schools were fitted up in company buildings along the line. Evening classes were established at convenient locations for the men, and the instruction was arranged so that the lessons and work the men were engaged in were associated. Motion pictures were used to prevent the study from getting tiresome. After several months a "first-paper day" was arranged, and applicants for their first citizenship papers were received at the court houses in Waukegan, Ill., and Kenosha and Milwaukee, Wis. This was a gala day, and the percentage of track employees not citizens or embryo citizens dropped from 90 per cent to 27 per cent. The success of the educational work is such that it is being continued, and a school has been started for the instruction of foremen who desire to prepare for such work. Safety classes are also held and accident prevention is taught.

Educational work of a similar character has been carried on by the People's Gas Light & Coke Company and the Commonwealth Edison Company, the co-operation of the Chicago Association of Commerce and the Chicago Board of Education having been obtained. The Edison company has been conducting classes in citizenship in its Fisk Street station in Chicago and in a public school building on the West Side. In the other Insull companies the work has taken on more of an individual character, as the properties are rather widely scattered and they employ relatively a much smaller number of non-citizens.

## Utility Maintains Information Bureau

VISITORS to the Turk's Head Building, Providence, R. I., which houses the headquarters offices of the Narragansett Electric Lighting Company, have found an information bureau maintained by the company in the main corridor on the street floor a great convenience. The bureau, illustrated herewith, occupies a corner between the main entrance and the company's electric shop and is equipped with a display cabinet for appliances, an illuminated bulletin calling attention to the value of labor-saving devices in the home, directories and facilities for small-scale demonstrations. During business hours a clerk familiar with the company's personnel, location of offices, departments, etc., and conversant with the company's practice regarding service applications, is on duty. On occasion electrically prepared toast and coffee have been demonstrated at the counter, and the service rendered saves no small amount of time for visitors to the company's offices unfamiliar with the location of officials and departmental headquarters.

PROVIDENCE COMPANY'S INFORMATION COUNTER

## What Other Companies Are Doing

**Providence, R. I.**—In the last four years the Narragansett Electric Lighting Company has added 12,143 residence lighting meters to its connected load, representing $1,260,291 in house-wiring contracts. In 1922 the company set 4,294 meters on house-wiring contracts, or a gain of 2,160 over the previous year's record, representing an expenditure by customers of $370,351 for house wiring. The company carries on continuous house-wiring contract development instead of seasonal or sporadic campaigns. F. A. Gallagher, Jr., is head of the lighting department.

**Falmouth, Mass.**—With a population density of about 70 per square mile, the number of customers of the Cape & Vineyard Electric Company has increased from 4,474 to more than 6,000 during the past three years. Last year's gross revenue was $334,893 against $290,512 in 1921. Eugene Carpenter, manager of the combined property, states that when the present interests acquired control in 1907 the gross earnings were but $12,000 per year. A consistent policy of co-operating with contractor-dealers throughout the Cape & Vineyard territory, coupled with intensive cultivation of lighting and power service and the application of a diversified rate system to meet contrasted summer and winter conditions, has been an influential factor in the above development.

**Illinois.**—A plan of educating the women employees in the different phases of public utility service has been put in operation by the Public Service Company of Northern Illinois. Mrs. M. A. Schrayer of the Evanston salesroom has been placed in active charge. Meetings have been held in several of the districts, on which occasions, in addition to a lecture by Mrs. Schrayer, addresses have been made by district officials.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Stratification of Gases Within a Boiler Furnace.*—W. C. STRUNK.—Method of taking combustion-chamber gas samples, analysis of air distribution in furnaces, operating relations of $CO_2$ and $O_2$ and methods for improving combustion efficiency are the main subjects discussed.—*Power*, Jan. 30, 1923.

*Developments of Steam Turbo-Generators, Water Turbines and Transformers During the Last Ten Years.*—A. ROSSOW, H. BAUDISCH and K. THIEN.—The authors give a brief review of the achievements made in the design and the manufacture of turbo-generators, hydraulic turbines and transformers during the last ten years in Austria and Germany. The unit output of steam turbines went up rapidly from 16,000 kva. to 25,000 kva. and finally to 60,000 kva. No data are as yet available as to what influence increased boiler pressure would have upon the formation of boiler scale and the chemical behavior of the boiler water. Careful design of the boiler firing system permits of the generation of 50 kg. of steam per square meter of heating surface. Pulverized coal is not being used yet to any extent in these countries on account of the high cost of the necessary auxiliary apparatus. Few changes have been noticed in the design of the Pelton waterwheels except as regards their size, which reaches now 25,000 hp. The Francis-type turbine has been much improved, the specific speed increasing from 450 to 600 and 700. The new propeller-type turbine with short and oblique vanes found extensive use on account of its high specific speed, which has reached 1,000. Great strides have been made during the last ten years in the design of transformers. Improved cooling methods permit today the building of practically limitless output units, curbed only by transportation possibilities. Several three-phase, 50-cycle units of 60,000 kva. rating have been successfully operated since 1918. Testing transformer sets of 1,000,000 volts, using the Dessauer series system, are being produced. One concern has designed and operated a 300,000-volt air-insulated testing transformer set. Air-insulated power transformers, formerly used very frequently, are becoming obsolete. A great deal of attention is being given to a better internal winding insulation to withstand more safely overvoltage stresses. On 100,000-volt transformers the first turns are made to withstand full line voltage. Circular coils are gaining ground constantly over rectangular and oval coils. Oil conservators are now used generally for all sizes and voltages. Output and voltage standardization is well under way.—*Elektrotechnik und Maschinenbau*, Jan. 1, 1923.

*Hydro-Electric Power Supply.*—A. TUSTIN.—The author describes briefly the chief constituent parts of a hydro-electric development and their functions, discusses some of the economic factors controlling the development and operation of water-power plants and considers the question of tidal power where it exemplifies the working of these economic factors.—*Journal of the Institution of (British) Electrical Engineers*, January, 1923.

## Generation, Control and Switching

*Switching Apparatus for High Voltage.*—A. ROTH.—According to the author's claims, Switzerland seems to be definitely gravitating toward the use of outdoor substations. Taking a voltage range of 25,000 to 150,000, it is claimed that savings of from 25 per cent to 30 per cent may be realized over an indoor installation. Radiator transformers almost identical with the type used in America have been standardized for large self-cooled units for outdoor use. Very carefully designed oil switches, as a rule with one or more resistance steps and built pressure-proof, are now in general use. Insulators made of a special paper are being employed for indoor stations, while dry or oil-filled porcelain insulators must be used outdoors. Three-phase disconnecting switches for more than 40,000 volts should be coupled to open simultaneously for all phases so as to avoid overvoltages. Bar-type current transformers are preferred on account of their higher safety under short circuit stresses. Modern European practice recommends a quenching coil or a Y-point grounding as the most effective overvoltage protection. For overhead lines up to 80,000 volts the quenching coil is used, for higher voltages the Y-point is grounded directly, while underground cables up to 30,000 volts are Y-grounded over a resistor. To guard against resonance of discharge waves the resistance shunting of all inductances, like relays, current transformers, trip coils, etc., is recommended. The article contains a great many instructive photographs.—*Elektrotechnik und Maschinenbau*, Jan. 28, 1923.

*Measurement of Loads on Pole-Type Transformers.*—C. E. SCHWENGER.—Information as to the temperature of transformers may be obtained in several ways, but the two most common means are the measuring of the temperature directly and the measuring of the loading current and deducing from it the temperature. For the latter condition the characteristics of the transformers and also the duration of the load must be known. For the first method the instruments used are the thermometers, temperature semaphores and maximum thermometers, while for the latter indicating ammeters, curve-drawing ammeters and maximum-demand ammeters are used. The author considers the merits of each type applied to transformers in service.—*Electrical News*, Feb. 1, 1923.

## Transmission, Substations and Distribution

*Electric Transmission Practice in Europe.*—L. KALLIR.—In a review of the last ten years of Austrian and German transmission line and substation practice the most important improvements are described. Owing to the moderate distances, 110,000 volts will probably be the highest needed tension. The first line operating at this voltage has been in operation since 1912, and since then several others have been added. The very strict rules previously governing the erection of high-voltage trunk lines have been simplified, especially in regard to crossings of highways, railroads and telephone lines. The satisfactory experiences gained with steel-aluminum cables are now a welcome relief in these countries since copper is lacking. Considerable space is given to the description of the different types of reinforced concrete poles used. Centrifugally cast round poles seem to give best service. Cap and Hewlett type insulator chains are in general use, and several companies plan to add metal rings to the last insulator element to give a better voltage distribution and to keep the arc away from the insulator chain. A general aversion is noticeable in these countries for the Y-grounded systems. In many stations the Y-point is connected to a Petersen or other quenching coil. In all extended networks a selective protection system is in use, such as the Lypro protection or the Pfannkuch system. The recent porcelain shortage prevents the general adoption of outdoor substations, as almost all insulators are made of paper.—*Elektrotechnik und Maschinenbau*, Jan. 1 and 14, 1923.

## Motors and Control

*Electric Drive in Mines.*—J. GUTMANN.—A paper of a generally descriptive nature, reviewing the up-to-date construction of electrically driven machinery as used in mines. The article deals with coal drills and cutters, conveyors, power shovels, mine fans, air compressors, pumps, small locomotives, winches and a large variety of mine hoists for direct and alternating current.—*Elektrotechnik und Maschinenbau*, Jan. 1, 1923.

*Electric Elevator Inspection.*—J. M. WALSH.—Serious mishaps to passenger or freight elevators may result in loss of life or heavy damage to property, and even a minor failure may cause

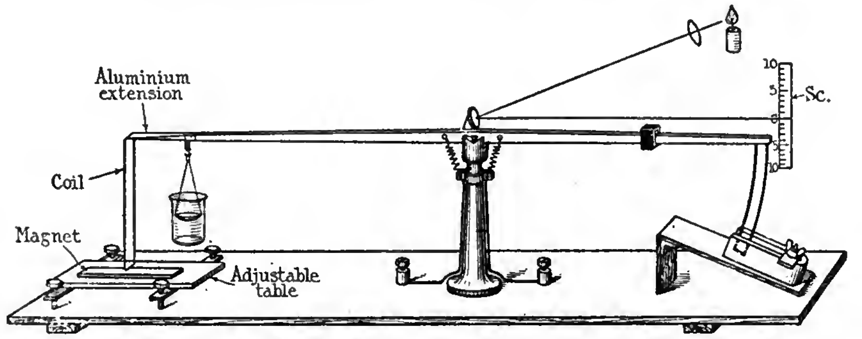
expensive interruptions of service. Proper inspection will detect trouble before it becomes serious. In this article the author outlines the inspection schedule for electrically driven elevators of the type used in industrial plants and tells how to make the adjustments that are necessary.—*Industrial Engineer*, February, 1923.

*Textile Mill Drive.*—The textile drive was among the earliest applications of the electric motor. In this industry there are numerous processes involved, and higher efficiencies are secured by combinations of individual and group drive. Specific installations in silk and cotton mills are described. The broad field of textile printing is covered in a general way.—*Electrical News*, Jan. 1 and 15, 1923.

*Crane Motors.*—J. F. LOCHHEAD.—A description of the construction and characteristics of direct-current and three-phase completely inclosed motors, such as are used on cranes or drives, where water-tightness is essential. Outstanding features of these are two and one-half times starting torque and only 60 per cent to 65 per cent of the usual momentum.—*Brown-Boveri Mitteilungen*, January, 1923.

## Units, Measurements and Instruments

*The Measurement of Flux Density in the Air Path of a Magnetic Circuit.*—W. P. CONLY.—A magnetic balance has been devised for the accurate measurement of the intensity of field at any point in the air path of a magnetic circuit, the instrument being sufficiently



INSTRUMENT FOR MEASURING THE INTENSITY OF A MAGNETIC FIELD

delicate to detect differences in intensity of field amounting to one line per square centimeter, whereas existing methods measure only the average intensity over the whole field or are only sensitive to differences of 150 lines to 200 lines per centimeter per centimeter. The instrument shown in the accompanying illustration has been constructed, based on the principal of balancing by a weight the force deflecting a short conductor placed in a magnetic field. The distribution of the lines of force issuing from the sides of a bar magnet have been plotted by the author, who has found that the surface of the magnet is not an equipotential surface. He also proves, experimentally, Boit-Savart's law.—*Journal of the Institution of (British) Electrical Engineers*, January, 1923.

## Heat Applications and Material Handling

*Gray-Iron Castings from Electric Furnace.*—L. J. BARTON.—The author considers the possibility of the commercial production of plate iron castings from electric furnaces, compares acid and basic practice and discusses the rôle of heat treatment. Exhaustive tests carried out on the production of these castings have been made by him. As a result of these he recommends the procedure to follow to procure a first-class product.—*Iron Age*, Jan. 25, 1923.

*Welding Practice on the Southern Pacific.*—How electric arc and gas welding is extensively used in the Sacramento general shops of this railroad is discussed in this paper, which was presented before the San Francisco Section of the American Welding Society. Certain factors which determine the physical characteristics of a welding joint are enumerated, among which are examination of the weld by visual means, clipping the edges of the deposited metal with a cold chisel to determine the relative adhesion of the deposit, pulling apart a welded section cut from the finished product and the bending and breaking test.—*Railway Electrical Engineer*, January, 1923.

## Electrophysics, Electrochemistry and Batteries

*X-Ray Examinations of Steel Castings.*—H. H. LESTER.—It is now possible to locate $\frac{1}{16}$-in. flaws in steel 3 in. thick with a thirty-minute exposure using commercial X-ray tubes. Correspondingly smaller defects can be likewise revealed in thinner sections. A complete description of the apparatus and method of applying the X-ray machine for this purpose is given.—*Chemical and Metallurgical Engineering.*—Feb. 7, 1923.

## Traction

*Electric Clock System for the Berlin Rapid Transit Lines.*—O. WILIGUT.—Distributed over the great number of stations of the elevated and subway lines of the Berlin rapid transit system are more than 500 electric clocks, which are controlled from one master clock. They are operated every thirty seconds with a short current impulse of changing direction. All clocks in each of these lines are connected in series, operating on 60 volts. The current impulse is only 350 milliamperes and is supplied from two storage batteries, one of which is a stand-by.—*Siemens Zeitschrift*, January, 1923.

*Advantages of Diesel Electric Locomotives.*—L. G. COLEMAN.—There has been great development of Diesel engines in the last twenty-five years, but the author points out that only the surface of the subject has been opened up. He says that a modern Santa Fé type locomotive with fully loaded tender weighs approximately 283 tons. A Diesel electric locomotive of similar tractive effort can be build to weigh about 130 tons and will require available at its maximum point of consumption 1,800 kw. Locomotives of this type provide great flexibility in design.—*Railway Age*, Jan. 20, 1923.

## Telegraphy, Telephony, Radio and Signals

*The Design of Radio Towers and Masts.*—C. F. ELWELL.—Several examples of the variety of specifications employed to calculate the wind pressure on radio towers are brought out by the author. In building design the assumption that the wind pressure at the top is the same as at the ground level is not very erroneous, but in the case of radio masts this load is the chief factor to be considered. The author points out that on a large number of high radio masts and towers which have been built in recent years there are many opportunities for placing pressure indicators at various heights. The data that could be secured from this source would help to a great extent designers who have the problem of designing radio masts and towers.—*Electrician*, Jan. 26, 1923.

*Effect of Local Conditions on Radio Direction-Finding Installations.*—R. L. SMITH-ROSE and R. H. BARFIELD.—An account is given of some of the experiments carried out during the past year by the sub-committee of the Radio Research Board (England) on wireless direction finding. The authors summarize the work of previous investigators along the same lines and indicate why further research was necessary. Various experiments are described and quantitative data are provided regarding the effect of metal work, coils, aërials, overhead wires and trees on a direction-finding set in their vicinity, with definite figures showing the extent in which certain kinds of errors are produced by mountains and buildings. —*Journal of the Institution of (British) Electrical Engineers*, January, 1923.

*Operation of Receiving Tubes from Direct Power Supply.*—A. RINGEL.—The author relates his experiences in operating oscillators and amplifiers from a 240-volt direct-current line. He points out that direct-current lines have additional advantages in that no external B batteries are necessary. He then goes on to describe practical circuits, explaining the essential methods involved with various systems.—*Wireless Age*, February, 1923.

# Scientific and Industrial Research

A Department Devoted to Reports of Investigations Contemplated or Completed, Research Facilities Available and Suggestions for Co-operative Work

*Conducted by* PROF. VLADIMIR KARAPETOFF, *Cornell University, Ithaca, N. Y.*

[ PRINTED IN THE THIRD ISSUE OF EACH MONTH ]

[When investigations which have been completed are, in the opinion of the editors, of wide enough interest to the field we serve, details thereof will be presented in other parts of this paper. Contemplated research or that which appears to have limited appeal will be only briefly reported in this section, but details may be had by communicating with the investigator or institution named in the report. Readers are referred to the department "Digest of Electrical Literature" for investigations reported in other journals. The news and engineering sections should also be followed for research reported before technical societies.]

## Research Completed

### Carrier-Current Broadcasting

Broadcasting over 2,300-volt, three-phase, and 115-volt lines has been accomplished in Lakewood, Ohio. A 50-watt transmitter was employed, which operated through protective-tuning condensers into the 2,300-volt, three-phase lines. The receiving apparatus consisted of an inductively coupled circuit tuner, a vacuum-tube detector and a two-stage audio-frequency amplifier. The circuit was maintained in the non-regenerative condition. The 3,800-m. wave-length tests were the most satisfactory. Careful comparison was made between reception over the 115-volt lines and from an antenna. With 3,800 m. good reception was obtained over the former and only the faintest on the latter. Throughout the experiments no changes were made or required in the transmission system.—*R. D. Duncan, Jr., North American Company, New York.*

### Concrete, Effect of Calcium Chloride in

The studies on the different methods of proportioning concrete mixtures carried out in co-operation with the American Society for Testing Materials have been completed, and the use of certain admixtures for accelerating the early hardening of concrete has been studied. It has been found possible by the addition of small percentages of calcium chloride to increase the early strengths of concrete to such an extent that forms can be removed at least twenty-four hours sooner than would otherwise have been possible. This has been applied on the Queenston-Chippawa development and enabled maximum production to be obtained from the canal-lining plants during the fall and winter months.—*Hydro-Electric Power Commission of Ontario, Toronto.*

### Lamps, Best Efficiency at Given Price and Cost of Power

A study of the economics of lamp operation under present conditions has been made. Calculations of the cost of lighting for different rates of power and prices of lamps indicated that, although the solution of the problem of the most economical efficiency is too complicated for general application throughout the province, a satisfactory compromise can be made. The adoption of efficiencies to produce an average life of 1,500 hours was decided upon as the most suitable for general use on Hydro systems.—*Hydro-Electric Power Commission of Ontario, Toronto.*

### Pressures, Mechanical, Piezo-Electric Measurement of

A number of circular quartz plates are cut from a quartz crystal so that an electric axis is perpendicular to the plane surface of the plates. These plates are stacked up condenser-fashion with sheet-metal electrodes. Electrodes collecting charges of like sign are connected to a common terminal. The two terminals are electrically connected to a ballistic galvanometer. The stack of plates is subjected to the pressure to be measured by means of a piston which exerts a force perpendicular to the plane faces of the plates. When pressure is applied, a charge is liberated by the plates which flows through the galvanometer, causing a deflection. The galvanometer deflection is photographed on a rapidly moving film. The pressure-time curve is the differential of the recorded deflection-time curve multiplied by the proper constant. It has been found that the amount of charge liberated by the quartz plates is proportional to the pressure applied, for pressures up to 50,000 lb. per square inch.—*J. C. Karcher, Bureau of Standards, Washington, D. C.*

[This principle has been utilized in several gages for pressure measurements in guns, and the results found to be in entire accord with the same pressures determined by other means.—EDITOR.]

### Radio Communication in Mines

Tests conducted at the experimental coal mine of the Bureau of Mines at Bruceton, Pa., hold out the hope that wireless waves may be used in the future as a means of effective communication between rescuers on the surface and miners entombed in mines. Signals were heard distinctly through 50 ft. of coal strata, although the audibility fell off rapidly as this distance was increased. The absorption or loss of intensity with distance is very great for the short wave lengths used in these tests. Longer waves are known to suffer less absorption and may possibly be found practically effective under certain conditions.—*United States Bureau of Mines, Washington, D. C.*

### Reactors, Current-Limiting

Tests to destruction have been made on large reactors with a 27,000-kva. special alternator, to ascertain the mechanical stresses which such reactors should be able to withstand. Tests have also been made on the effect of shunting the reactors with carborundum resistors. It seems that the resistors damp out oscillations and clear the system of disturbances which might otherwise build up very high voltages.—*A. I. E. E. Sub-Committee on Current-Limiting Reactors.*

### Sphere Gap for 1,000,000 Volts

Hollow spheres, 100 cm. in diameter and about 9 mm. thick, have been cast of special bronze and carefully turned to size. One sphere is attached to the top of the condenser bushing terminal of the million-volt transformer; the other is suspended vertically over it on an insulating shaft terminating in a metal rack. An electric motor, operated from the switchroom, is geared to this rack. Zero setting is accomplished electrically, and the motor is stopped instantly when the upper sphere touches the lower one.—*J. F. Peters and D. F. Miner, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.*

## In Progress or Proposed

### Cable Operation

Committee program: Automatic selective protection for underground distribution, both alternating current and direct current: Enlarge upon principles set forth in the American electrolysis committee's report so that they can be applied and digested by the cable using companies; continue record of burnouts and failures; investigate methods of measuring sheath current to ground. Temperature survey methods: Permissible short-time excessive overloads without causing damage to cables. Heat radiation from conduits: Cases of excessive heating and how cured; spacing between adjacent conduits; best arrangement and maximum number of ducts in a bank; advisability of reducing heating in large banks by increasing copper. Use of kenotron in testing cable: (1) High-voltage tests, i.e., breaking-down faults; (2) routine insulation tests. Expansion of cables.—*Underground Systems Committee of the N. E. L. A.*

### Circuit-Breakers, Oil, Duty Cycle of

In view of the lack of agreement among the various organizations interested in the matter of duty cycle, it is proposed to begin work on the guidance of member companies contemplating oil-circuit-breaker tests, specifying the data which are necessary to certify or amplify the correctness of the present definition of interrupting capacity. It is believed that such a course will eliminate to a large extent duplication in tests and will also serve to remove elements of doubt as to the efficacy of the tests.—*A. I. E. E. Sub-Committee on Circuit Breakers and Switches.*

### Condensers, Dielectric Losses in

A comparative study is being made of the methods used in measuring dielectric loss in condensers, especially those having a large value of capacitance. An air condenser is available with a capacitance 0.1 mf. which will withstand 3,000 volts without corona. By means of bridge methods the losses in other condensers may be compared with this condenser, which has a negligible loss. Other methods of measuring dielectric loss will also be investigated, particularly the electro-dynamometer method and the electrostatic wattmeter method.—*Bureau of Standards, Washington, D. C.*

[This investigation will be of considerable importance for the measurement of dielectric loss in power cables, in which this loss often limits the current rating.—EDITOR.]

### Grounding of Transmission Systems

A questionnaire was sent out, and the replies from thirty-one companies indicate a very wide divergence in practice. Some systems, including many miles of line at very high voltages, are apparently operating successfully ungrounded, although the trend is strongly toward a dead-grounded neutral for systems operating at 66,000 volts or above. For systems operated at lower voltages resistances of widely varying ohmic magnitude are used. Practice with reference to switching, type of ground used and other protective devices is also very divergent, and some unique schemes have come to the committee's notice.—*A. I. E. E. Sub-Committee on Grounding.*

## Suggestions for Research

### Cables, High-Tension, Dielectric Strength Test

The standards of the Institute cover only the maximum length of the sample and the limiting temperatures. The rules also specify the test voltage to be applied to full reels of varnished-cambric and impregnated-paper cables at the factory, but not the ratio between the dielectric strength and the high voltage applied to full reels. If the standards of the Institute should help to determine whether or not the cable is satisfactory for the proposed working voltage, then the rules should include a dielectric strength test so as to insure that the cable has a proper factor of assurance.—*A. I. E. E. Cable Research Committee.*

### Corona Loss Below the Visual Voltage

Peek's well-known quadrature law for the corona loss, $(e_v - e)^2$, holds true above the visual critical voltage $e_v$. Between $e_v$ and the lower disruptive critical voltage, $e_0$ the corona loss is erratic and depends upon the surface condition of the wire. It happens, however, that in many cases on actual transmission lines it is of importance to know the loss to be expected in this erratic region, for which we have no formulas. The most economical amount of copper or aluminum to be put in the line is sometimes determined by the loss at voltages below $e_v$. An extensive investigation in the range between $e_v$ and $e_0$ is desired, under the actual atmospheric and wire surface conditions met with on long transmission lines.—(See *A. I. E. E. Transactions*, 1918, Vol. 37, page 118.)

### Furnace, Electric, Non-Oxidizing

It is exceedingly difficult to have anything but a somewhat oxidizing atmosphere in the electric furnace chamber. This makes some process applications difficult, as, for example, the bright annealing of steel. For such applications the development of a furnace with non-oxidizing atmosphere is highly desirable.—*J. L. McK. Yardley, Pittsburgh, Pa.*

# News of the Industry

**Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men**

## Court Defines Wholesalers

**Co-operative or Mutual Associations, Although Buying in Wholesale Quantities, Are Retailers**

THE United States Circuit Court of Appeals, Second District, in a decision written by Judge H. W. Rogers and handed down this week in the case of the Mennen Company against the Federal Trade Commission, upset the ruling of the latter and elucidated many points under the Federal Trade Commission act as well as under the Clayton act. The right of a manufacturer to classify buyers was upheld, the court decreeing: "If real competition is to continue, the right of the individual to exercise reasonable discretion in respect of his own business methods must be preserved."

The court states that "the Mennen Company, acting independently, has undertaken to sell its own products in the ordinary course, without deception, misrepresentation or oppression, and at fair prices, to purchasers willing to take them upon terms openly announced. . . . The company is engaged in an entirely private business, and it has a right freely to exercise its own independent discretion as to whether it will sell to wholesalers only or whether it will sell to both wholesalers and retailers, and if it decides to sell to both, it has a right to determine whether or not it will sell to the retailers on the same terms it sells to the wholesalers. . . .

"It did not discriminate as between retailers, but sold to all retailers on one and the same scale of prices; and it did not discriminate as between wholesalers, but sold to all wholesalers on one and the same scale of prices.

### Mutual Corporations Retailers

"In conclusion," says the decision, "it ought perhaps to be said that we have not been unmindful of the fact that the Mennen Company, in classifying purchasers into two groups, those of wholesalers and retailers, placed in the group of retailers a class of mutual or co-operative corporations which purchased in large quantities the Mennen products. These mutual or co-operative corporations, it is admitted, consist solely of the retailers in the same line of trade, the stock being held exclusively by retailers.

"The fact that these individuals, admitted by the counsel for the Federal Trade Commission to be retailers, see fit for their own convenience to organize themselves into a corporation which they constitute their agent for purchasing purposes does not change their character or the character of their purchases and convert them into wholesalers."

The Circuit Court of Appeals, in the course of its opinion, discusses the Clayton act and also the Federal Trade Commission act and lays down a broad interpretation of these acts contrary to that heretofore adopted by the Federal Trade Commission. It concludes with the statement that "The Mennen Company is not shown to have practiced unfair methods of competition in commerce." The important bearing of this decision on the legal aspect of trade associations is obvious.

## Langmuir Talks on Increasing Electron Emission

Recent discoveries in electron emission and current control were related by Dr. Irving Langmuir before the Schenectady Section of the A. I. E. E. on March 16. He referred particularly to the increased electron emission obtained with new cathode materials, that of thoriated tungsten at 1,500 deg. absolute being 130,000 times that for ordinary tungsten. Other materials have even greater emissions. If very high voltages are applied to the anode, Dr. Langmuir declared, it is possible to pull electrons out of even cold cathodes, but they come from minute areas. Attention was also called to the effect of alkali vapors in vacuum tubes, it being pointed out that cæsium vapor will give an electron emission equivalent to 0.3 amp. per square centimeter of filament surface at temperatures below a visible red heat.

## Hoover for Interstate Power Treaty for Northeast

The next step toward the realization of the superpower plan in the Northeast, George Otis Smith announced at Washington on March 10, will be a conference between members of the superpower advisory board and representatives of the eleven state commissions having jurisdiction over public utility matters in that region. Commerce Secretary Hoover believes the most workable scheme to insure the co-ordination of these regulating bodies would be the drafting of an interstate treaty along the lines of the Colorado River compact.

An early effort will be made to have a legal study undertaken of the existing state statutes or regulations which would interfere with the superpower project.

## Pinchot Pleads with Smith

**Pennsylvania Governor Asks New York Executive to Discontinue Fight on Federal Power Board**

A LETTER sent by Governor Pinchot of Pennsylvania to Governor Smith of New York just after the message of the latter to the New York Legislature advocating state ownership, development and limitation of water powers asks Governor Smith to withdraw the suit now before the United States Supreme Court which seeks to annul the federal water-power law and to give each state the right to control the water power generated within its own boundaries.

Pennsylvania and New York should co-operate, Governor Pinchot writes in telling Governor Smith that he will regard with deep concern any movement to separate their mutual interests. Governor Pinchot holds that in exchange for power generated at Niagara Falls and along the St. Lawrence River, part of which could be diverted into northern and western Pennsylvania, that state could give to New York a percentage of the fuel power derived from its mines.

### Nation-Wide System Must Come

"After eighteen years of study and work upon this problem," Governor Pinchot says, "I have come confidently to expect the growth of a nation-wide interlocking power system. No small part of this future power development, especially water-power development, will, I believe, be made by state or municipal enterprise—some, perhaps, by national or even international undertakings.

"By proceeding under the federal water-power act and by accepting the preference it gives to state enterprise over private enterprise, New York can initiate the new policy under the most favorable circumstances and without the delay inseparable from litigation and can do so without jeopardizing the interests of other states. For it is true that by this statute, and by it alone, the rights of the people of all the states in water power are now safeguarded. If the State of New York should attempt, and unhappily succeed, in overthrowing it while safeguarding the rights of her own people, she would thereby strike down the people's rights in forty-seven other states which are not ready to undertake a state ownership policy at this time."

Governor Smith's answer had not been given out when the ELECTRICAL WORLD went to press.

## Topics at Oklahoma City

### Company Policies and Rates, Commission Control and Public Relations Discussed by Utility Men

ASSERTING that the three essentials of a successful public utility are an efficient and sufficient plant, intelligent supervision and organization and a form of rate that will distribute the costs of service equitably among all classes of customers, F. C. Hamilton, consulting engineer of the Cities Service Company, speaking before the fifth annual convention of the Oklahoma Utilities Association, held at Oklahoma City on Monday to Wednesday of this week, dwelt on the necessity for a proper rate form if these essentials are to be realized.

Mr. Hamilton advocated a three-part rate in which a fixed or readiness-to-serve charge, a demand charge and an energy rate are contained and asserted that one reason why the gas utilities, in spite of their advantage in number of consumers, have lagged behind the electric utilities is the fact that flat meter charges in place of rate forms that take into consideration the load factor and characteristics of the customer's demand have been employed ever since the inception of the gas business, while the electric utilities have utilized forms of rates that have taken these things into consideration and thus have encouraged rather than discouraged utilization of their service. He said that the flat meter rate penalizes the best users of service and, regardless of the specific value of the rate, will not build up a profitable business.

#### POWERS OF COMMISSIONS

In discussing the subject "Is Anything Ultra Vires in Utility Regulation?" E. F. McKay of the Oklahoma Corporation Commission called attention to the fact that utility powers are exclusive and not inclusive, since these powers are fixed by law and any case with which the commission is allowed to deal must possess a definite interest for the public. Commissions, he pointed out, have no arbitrary powers.

Martin J. Insull, in discussing "The Public's Interest in the Public Utilities," said that without disparagement of the technical and operating forces in the utility field the two big problems in that field are public relations and financing. Confidence in utilities on the part of the public is necessary, he continued, before financing can be carried on and the technical and operating talent have full play in establishing the service the public wants and is entitled to.

Charles B. Scott enumerated the benefits of accident prevention work in utility organizations as the establishment of public confidence, the building up of a proper relation between the company and its employees and the promotion of the most efficient operation. He asserted that the utilities in any community should not only participate but take the initiative in community safety efforts. The first essential in making safety work a success is interest on the part of the company management, the second interest by the supervisory forces and the third a definite plan and organization.

Labert St. Clair, the director of the advertising section of the American Electric Railway Association, told of the sympathy and human understanding that lie at the bottom of successful public relations work.

On Tuesday afternoon the Electric Light Division of the association listened to a discussion of how to prevent theft of electricity. The strengthening of the present Oklahoma law on this matter and the use of conduit entrances were favored. W. D. Riggs of Oklahoma City, who led the discussion, made a plea for the careful treatment and installation of meters, styling the electric meter the utility's cash register.

O. B. Seyster of Bartlesville, speaking on "Building Good Will," expressed dislike for the term "public good will" and suggested the term "customer good will." Educational work he held to be threefold—the education of employees, of the adult consumer and of the future consumer, now in the schools.

Gen. George H. Harries in an address on Wednesday expressed the belief that the period of ill-considered utility regulation is past and that regulatory commissions are now on the same plane as courts of justice and realize their obligation to see that both the public and the utilities receive just treatment.

The retiring officers were re-elected for the coming year as follows: President, Fred W. Insull; first vice-president, Sherman Mooter; second vice-president, J. C. Chestnut; treasurer, William Mee. O. D. Hall, who has been acting secretary, was chosen manager. C. L. Proctor of Joplin, Mo., was made chairman of the Electric Light Division of the association.

## Joint O. U. A. Session With Southwestern N. E. L. A.

That constitutions and laws are mere scraps of paper unless they exist in the hearts and minds of the people was the assertion of John W. Gleed, general attorney of the Southwestern Bell Telephone Company, in his discussion of public relations before the opening session of the Southwestern Geographic Division of the National Electric Light Association, which was a joint session with the Oklahoma Utilities Association, at Oklahoma City on Wednesday. Mr. Gleed told the delegates that utility owners and stockholders are vastly outnumbered and that in theory all sorts of dire things can come of regulation, since all utility matters, including the fate of regulatory commissions, are in the hands of the public. In the end the public will get about what is demanded as the result of its moral and intellectual level.

Henry S. Ives of the Casualty Information Clearing House of Chicago, in an address on "State Ownership and Operation of Insurance," made a plea for a stronger stand against state socialism and the building up of conditions under which individual initiative will be encouraged, declaring that he did not understand the term "saturation" as applied to the use of electrical energy and could see no likelihood of the result ordinarily understood by the term.

M. H. Aylesworth, executive manager of the National Electric Light Association, called attention to the growth of customer ownership and the growth of the utility business. Though it is not possible now, Mr. Aylesworth expressed the belief that eventually the farmer must be served by the central station.

The N. E. L. A. geographic division convention continued until Friday.

## Illinois Operators Discuss Educational Courses

The establishment of public utility courses in universities, to be patterned after the present courses in economics and business, received great attention at the third joint convention of the Illinois Utilities Association, held at the Hotel Sherman, Chicago, on Wednesday and Thursday of this week. Prof. Charles M. Thompson of the University of Illinois declared that the main outlines of such a course would be ready for next year's classes. He called this course descriptive engineering, a term which, while including the fundamentals of utility regulation, would give students a better appreciation of utility problems. Prof. Ralph E. Heilman, Northwestern University, added that such courses would afford utility companies the means of combating public prejudice through a loyal and aggressive personnel.

Britton I. Budd, president Public Service Company of Northern Illinois, insisted that the whole matter was "up to" the utilities, which should so handle the graduates they now employ that coming graduates would want to join their organizations. The movement was viewed with favor by Martin J. Insull, John F. Gilchrist, W. H. Sawyer and B. J. Denham.

On Wednesday afternoon H. E. Wulfing, Commonwealth Edison Company, spoke on the remote-controlled automatic substations installed in Chicago at an average cost of $2,160 for pilot-wire control. By means of two-line relays operating in synchronism through rotating wiping arms connected to twenty-five contacts all station operations can be controlled by the station dispatcher.

F. E. Goodnow, Public Service Company of Northern Illinois, presented a paper on the automatic feeder substations at Lemont and Barrington, the first of which has been in operation since Dec. 8, 1920, without any serious interruption of service.

The Thursday sessions were devoted to commercial problems with a symposium including talks on selling domestic appliances by R. S. Bell, on electric cooking by A. M. Lloyd and on convenience outlets and electrical homes by J. J. Kirk.

## To Finish Holtwood Plant

**Two 20,000-Hp. Turbines to Be Added by Pennsylvania Water & Power on Susquehanna**

COMPLETION of the Holtwood power station of the Pennsylvania Water & Power Company, on the Susquehanna River, is finally to be brought about, after almost ten years' delay caused by the war. A contract has been given the I. P. Morris Department of the William Cramp & Sons' Ship & Engine Building Company for the remaining hydraulic machinery needed, principally consisting of two 20,000-hp. Francis turbines of the I. P. Morris design.

The addition of this equipment will bring the station rating up from 110,000 hp. to 150,000 hp., for which it was originally planned. The present hydraulic equipment consists of eight turbines, all of I. P. Morris design and construction. The two new wheels will not only be much larger and more powerful than any of the older ones, but the delay has enabled the Cramp company to embody in them a number of improvements evolved since the original installation was made, in the design of draft tubes and so forth. All accessories are of I. P. Morris design and construction throughout.

The Holtwood station operates on an average effective head of 54 ft., the concrete dam being 55 ft. in height and half a mile long. The present battery of generators is of the three-phase, 25-cycle type, with 11,000 voltage at the generator terminals. This is stepped up by transformers to 70,000 volts for the long-distance transmission lines.

During the war the Pennsylvania Water & Power Company installed electric furnaces at the Holtwood station and produced a large amount of ferro-silicon and other alloys for military purposes. This plant, however, was discontinued soon after the armistice, and the company has no present intention of going outside its original field—the supply of electric light and power to the cities of its territory.

## Penn Central's New Plant at Saxton

Rapid increase of land has led the Penn Central Power Company of Altoona, Pa., which serves an area of 350 square miles with energy for coal mines and other industries, street railways and domestic lighting, to begin the erection of a plant at Saxton, Pa., close to coal mines, which will have an ultimate rating of 80,000 kva. The initial installation in the new plant will consist of two 12,500-kva. Westinghouse turbine-generators, three-phase, 80 per cent power factor, operating at 60 cycles and 13,200 volts. These turbines will operate under a steam pressure of 250 lb. and 200 deg. superheat. Excitation will be supplied from directly connected exciters rated at 75 kw., 250 volts, and there will be a 150-kw., 1,200-r.p.m. turbine-driven exciter for a spare. The turbine generators will have 17,500 sq.ft. of condensers. The boiler equipment will consist of four 1,100-hp. Babcock & Wilcox Stirling type units, equipped with eleven retort stokers made by the Taylor Stoker Company.

Four high-tension circuits will leave the plant at the present time. There will be two circuits carried on a steel tower from Saxton to Summit, a distance of 25 miles. These circuits will have No. 4/0 copper conductors. There will also be two circuits carried on a steel tower from Saxton to Lewiston, a distance of 53 miles, the conductors being of 250,000-circ.mil copper. Although these lines will operate for the present at 45,000 volts, they will be designed for 110,000-volt operation. There will also be two 13,200-volt feeders for supplying power in the vicinity of the plant.

## Plan Intercompany Plant

**Steam Station at Fall River Projected to Meet Needs of Three New England Companies**

PLANS are maturing for the construction of a large steam generating plant at Fall River, Mass., to meet the requirements of increasing loads on the systems of the Fall River Electric Light Company, the Edison Electric Illuminating Company of Brockton, Mass., and the Blackstone Valley Gas & Electric Company, Pawtucket, R. I. It is proposed to erect the station in the vicinity of the present generating plant of the Fall River company on Mount Hope Bay, with ample facilities for condensing water and fuel supply, both oil and pulverized coal being under consideration. The estimated cost of the initial development, which would involve the installation of one 30,000-kw. unit at Fall River and the construction of high-tension steel-tower lines totaling 25 miles in length between Fall River and Pawtucket and Fall River and Brockton, is about $5,000,000. The preliminary investigation, which has been under way for the past two years, has been handled by Stone & Webster, Inc., Boston, managers of the Blackstone Valley and Brockton companies. Over a term of years the plant at Fall River would probably be enlarged to 150,000 kw. or over. The interconnection of the three systems would result in marked economies in fuel and labor costs and enable full advantage to be taken of diversity factors and reserve capacities.

It is proposed to organize the Montaup Electric Light Company, to be owned by the three utilities named, in order to build and operate the plant and lines concerned. The Massachusetts Gas & Electric Association recently filed a bill in the State Senate at Boston authorizing the ownership of electric company securities by other companies under the supervision of the Massachusetts Department of Public Utilities. The commission is in favor of the bill, and there was no opposition to the plan at a hearing last week before the committee on power and light.

## Power on the Farm

**Committee on Electricity in Agriculture Organized to Get Data and Conduct Research**

A COMMITTEE on electricity in its relation to agriculture was formed at a meeting in Chicago on Thursday of last week at which representatives of the rural lines committee of the National Electric Light Association, the American Farm Bureau Federation, the American Society of Agricultural Engineers and the United States Department of Agriculture were present. The result of the meeting was an outline study of the farm power problem from which it is hoped a rational plan for the utilization of electrical energy on the farm will come. As a basis of future work the farm power committee of the United States Department of Agriculture will be asked to undertake a complete farm-power survey covering all types of farm power, both animal and mechanical. In the same investigation the amount of power required for the various farm operations will, it is hoped, be analyzed and the whole worked into such form as will make it most useful in the study of the relation of electricity to agricultural work.

The N. E. L. A. will be requested to undertake this from the central-station angle, while similar data will be obtained from the individual plant field. Among other things in this analysis, the extent of rural lines, number of consumers on such lines, energy used, farm operations which make use of electrical energy and the present cost of the service to the farmer will be ascertained.

An outline of the investigations to be carried on under the supervision of the committee, which was organized with J. C. Coverdale, executive secretary of the American Farm Bureau Federation, as chairman and G. C. Neff, chairman of the rural lines committee of the N. E. L. A., as secretary, is as follows: (a) Farm-power survey; (b) survey of central-station and isolated-plant service to the farmer; (c) survey of agricultural uses of electricity in foreign countries, and (d) experimental and research work on the uses of electricity in agriculture.

## N. E. L. A. Retires Its Overhead Lines Specifications

Formal action has been taken by the overhead systems committee of the National Electric Light Association to withdraw the standards and specifications for materials and methods of construction for overhead lines that have been generally know as the "1914 specifications," these specifications having been superseded in fact by later specifications or rules, notably the National Electrical Safety Code, which is now an American engineering standard. The overhead systems committee has passed resolutions of withdrawal which have been approved by the executive committee of the National Technical Section of the N. E. L. A.

## Further Growth in Georgia

**New Development Program Will Cost Eleven and a Half Millions More—Unfailing Power Sure**

ASSURANCE that north Georgia is to have dependable hydro-electric power in such abundance that any community on the lines of the company can guarantee to prospective industries an ample supply is contained in an announcement just made by the Georgia Railway & Power Company, of which P. S. Arkwright is president, of a development program totaling $11,568,000 in addition to the program of $6,500,000 already announced for 1923. (See ELECTRICAL WORLD, Jan. 27, page 234.) The new program, on which work is announced to begin within a few weeks, will make the deliverable output of the company two and a third times the present capacity. Provision is made, among other items, for four new water-power plants. The developments to be made during the years 1923 to 1926, inclusive, bring the total cost of the company's announced program for enlargements and improvements of service to more than $18,000,000. The deliverable output of the company will be increased from 272,000,000 kw.-hr. to 635,000,000 kw.-hr. per year.

### Work to Be Started This Summer

Construction will be started on the first two of the four new power plants this summer and carried along at the same time with the work in progress on the Tugaloo and the Mathis-Tallulah water-power plants. These two new plants will be at points yet to be determined on either the Tallulah or Tugaloo River. Of the two other power plants to be erected, one will be at the Burton dam, the largest storage reservoir of the company, and the other (the Seed development) on the Tallulah River between the Burton and the Lakemont or Mathis dams. The Seed development is to be finished in 1925 and the Burton development in 1926. Coincident with the construction of the new power plants necessary transmission lines, substations, etc., will be built in order that the energy may be ready for delivery at the earliest possible moment. Transformer stations are to be erected at Lafayette, Chickamauga, Marietta and Summerville, and extensive improvements are to be made on the Butler and Davis Street steam stations in Atlanta in addition to those already announced, in order that the company may always have ample steam reserves.

### Water to Be Used Six Times

Water of the Tallulah and Tugaloo Rivers will be used six or more times to generate power under the proposed developments—first at the Burton power plant, then in the lake to be created by the Seed development, on through the Seed power plant, the Mathis Lake and power plant, the Tallulah lake and power plant, the Tugaloo lake and power plant, and also the two other power plants at locations not yet decided upon. Not later than by the end of 1926, according to the official announcement, power from seven water power plants will be actually in use, all of it controlled through the great control switching station to be erected at Tallulah this year, which will make it possible to switch power from any of the seven stations on to any of the transmission lines whenever desired.

# Hydro-Electric Growth on Pacific Coast

**Pit River Power House No. 3 to Be Started in Thirty Days with Capacity of 81,000 Kva.—New 22,000-Kw. Unit for Caribou—Seattle to Build 100-Mile, 165-Kv. Line**

CONSTRUCTION of Pit River plant No. 3, the second of a chain of power houses which will ultimately develop more than 600,000 hp. from the waters of the Pit River in northern California, will start within the next thirty days, according to an announcement made by John A. Britton vice-president and general manager of the Pacific Gas & Electric Company. The plant will have a capacity of three 27,000-kva. units and will be completed by the fall of 1925. The development will involve the expenditure of approximately $17,000,000. Pit River No. 3 will be about 12 miles below Pit River No. 1. The installation will involve the construction of a diversion dam 125 ft. high at a point 2½ miles below Peck's Bridge on the highway between Burney and Bartle. From this point a tunnel approximately 22,000 ft. in length, having a capacity of 3,000 cu.ft. per second, will carry the water to a point above the site of the power house. The plant will operate under a static head of 313 ft.

The initial step in the development will be the construction of an extension of the Pit River Railroad. The line will branch off at Cayton Valley and will follow the river in a southwesterly direction, a distance of 5 miles to the dam site. The road will then extend 5 miles further to the site of the power house. A gravity road will lower the material to the construction camp at the dam site before work on the permanent dam is started. A temporary diversion dam and tunnel will be constructed in order to facilitate construction work. The driving of the 4-mile tunnel will start immediately. The installation will also require the construction of 8 miles or more of double-circuit 220-kv. transmission line from Pit River No. 3 to the main transmission system.

In connection with the announcement relative to this latest step in hydro-electric development Vice-president Britton said: "The company on its electric service side is growing at a rate of 20,000 kw. to 25,000 kw. of peak load a year. Our engineers calculate that demands for electrical energy increase at the rate of 7½ per cent per annum, or an increase in kilowatt-hour requirements of 120,000,000 kw.-hr. a year. It was a pleasure to record the opening of Pit River No. 1 last fall; but this, despite the fact that it may be expected to contribute nearly 1,000,000 kw.-hr. a day to our electric distributing system, did little more than fill the gap between supply and demand that had been occasioned by a slackening in construction work during the war period itself. We expect to complete Pit River No. 3 by the fall of 1925, by which time, according to our calculations, the demands made upon us for electrical energy will have increased between 350,000,000 kw-hr. and 400,000,000 kw.-hr."

### Expansion at Caribou

Plans for the immediate installation of a third unit of 22,000 kw. capacity in the Caribou plant on the North Fork of the Feather River have been announced by J. B. Black, general manager of the Great Western Power Company of California. This addition to the generating capacity of the company will entail the expenditure of approximately $1,500,000. Surveying parties are already in the field and preliminary engineering work is under way. Bids for hydraulic and electrical equipment will be called for within the next fifteen to thirty days. The installation will include penstock, turbine, generator, exciter, transformers and other electrical equipment. Tunnels and transmission lines are already completed.

Increased load demands constitute the reason for the enlargement of the plant. At the present rate of growth the added power will be required within a year, and it is expected that the installation will be completed within that time. The present Caribou plant was placed in operation in the summer of 1901. The equipment includes two 30,000-hp. double overhung impulse wheels operating under a head of 1,080 ft. and two 11,000-volt, 22,223-kva. generators. The ultimate capacity of the plant is six such units.

### Skagit River Development

Bids for the construction of a hundred miles of 165,000-volt transmission line and telephone line from the Gorge Creek plant of the Skagit River development to the city of Seattle will be called for April 13, according to C. F. Uhden, chief engineer of the project. Specifications will be completed by March 30. The line will bring power from the Gorge Creek plant, the first unit of Seattle's municipal development program on the Skagit River, to a substation outside the city. The plant, which will have an initial capacity of 34,500 kw., will be completed late in 1923, and it is planned to have the transmission line ready for operation at the same time.

## Large Auto-Transformers for Southern California Edison

The Westinghouse Electric & Manufacturing Company has just completed for the Southern California Edison Company six of the largest single-phase auto-transformers ever built. The transformers are of the water-cooled type and are for outdoor service in the Eagle Rock substation of the company, to form a part of the largest 220,000-volt power system in existence. Each unit is rated at 36,700 kva., 50 cycles, giving a bank capacity of more than 100,000 kva., and is adapted for star-star connection with solidly grounded neutral, stepping down from 220,000 to 150,000 line voltages. A tertiary winding, connected in delta, is supplied for suppressing third harmonics in the voltage wave. The transformers are of the shell type and are designed to withstand without injury mechanical stresses due to short circuits. The tested efficiency was over 99 per cent.

The new transformers are to be used for changing the voltage of the two 150,000-volt lines now running between the Big Creek stations and the Eagle Rock substation to 220,000 volts. The Eagle Rock substation is designed for 150,000-volt incoming transmission lines, and, to avoid making changes in the substation, the new auto-transformers will be used to step down the 220,000 volts to 150,000 volts. The units are to be connected as an integral part of the 220,000-volt line, there being no circuit breakers in the high-voltage side. All the switching and metering will be done, as before, on the 150,000-volt side of the substation.

In addition to being the largest auto-transformers ever built, these units are

REAR VIEW OF AUTO-TRANSFORMER SHOWING ARRANGEMENT OF BUSHINGS

also the largest in existence for stepping down from a 220,000-volt line. An idea of their size will be given by the following figures: The tank, which has flat sides and half round ends, is 10 ft. 3 in. wide and 14 ft. 3 in. long. It is approximately 15 ft. high; the height from the ground to the tip of the condenser bushings is about 27 ft. Ten thousand pounds of copper and about 45,000 lb. of iron laminations were required for each transformer. Over a quarter mile of copper tubing was required for the coils, and at normal rating 75 gal. of water per minute must be circulated through them. The total weight of the complete transformer is over 90 tons, 9,050 gal. of oil being required for each tank.

## Prizes Offered for Letters on Customer Ownership

Financial and business publications generally, as well as a large number of national magazines of general circulation, are showing great interest in the growth of the movement for customer ownership of securities. Among these financial publications is *Forbes' Magazine*, which has offered $1,000 in prizes for the best letters replying to the question: "What are the benefits of customer ownership of public utilities?" This is an attempt to get the customer-owners' side of the new relationship between producer and consumer. The first prize will be $500, the second $200, the third $100, with forty prizes of $5 each. The contest will close May 19, winners to be announced in the June 9 issue of the magazine. Letters may be any length and competitors need not be subscribers.

At a recent dinner in New York officials of a number of electric light and power concerns, comparing figures and estimates, arrived at a total of $175,000,000 as the aggregate of stocks sold during 1922. Inasmuch as a leading investment bond house estimates total sales of $550,000,000 in bonds, this indicates a grand total of $725,000,000. Customers, a recent compilation shows, now own 1,320,000 shares of stock in eighty-four central-station companies which have reported out of two hundred engaged in the sale of securities to customers. One customer in every eighteen now owns stock, and the average purchase is seven shares.

# Modifications Made in Electrical Code

### Solid Neutrals Permitted as Are 15-Amp. Fuses on 125-Volt Branch Circuits—660-Watt Limitation Abolished—No Rule on Separation of Gas and Electric Meters

At least three very important modifications, so far as electric light and power companies are concerned, were made in the National Electrical Code at the meeting of the Electrical Committee of the National Fire Protection Association held in New York this week. These modifications were the permitting of solid neutrals, the sanctioning of 15-amp. fuses on 125-volt branch circuits, and the abolishment of the 660-watt limitation. The proposed addition to the code limiting the minimum separation of electric and gas meters was dropped. The outcome of other proposed revisions, such as the requirement of an insulating covering on overhead wires for voltages up to 5,000, the specification of outlet-box dimensions, the location of radio antennas with respect to power circuits, and the protection of motor circuits, will be reported in a later issue.

The new ruling on fusing branch circuits connected with mains which have one conductor grounded is worded to the effect that the fuse *may* be omitted in the branch circuit conductor of two-wire circuits connected with the grounded main conductor and *must* be omitted in three-wire circuits. In place of the old limit of 10 amp., there has been substituted a higher permissible fuse rating of 15 amp. for 125-volt branch circuits in general and 40 amp. for circuits designed for and serving "Mogul" sockets. With the ordinary sockets and receptacles twelve outlets are allowed per branch circuit instead of the old 660-watt limitation. By using conductors not smaller than No. 12 eight "Mogul" sockets may be connected per branch circuit.

Both of the proposed requirements on covering for overhead wires and dimensions of outlet boxes elicited considerable written and oral discussion at the public hearing preceding the final action of the Underwriters on the revision of the code.

According to the revised code radio antennas must be kept away from trolley circuits and conductors energized at more than 600 volts. Below this voltage ample clearance must be provided between the antennas and power circuits and durable construction must be employed.

## Proposed Changes in Tennessee Commission Law

A bill with the backing of the state administration is, it is announced, to be introduced into the Tennessee Legislature to amend the Public Utilities Commission act so as to vest in municipalities the right to make contracts and fix utility rates with local utility companies. Regulatory power over utilities doing an intercounty business will be left in the hands of the state commission. The measure will provide for appeal from a city's decision on local rates to the state commission, and from that body's ruling appeal may be taken by either party to the chancellor of the county and thence to the Supreme Court of the state. The bill also provides that final award by the highest reviewing body may not be retroactive. Electric light and power, telephone and other rates for state-wide systems will still be fixed by the commission.

## Utah Commission Weathers Legislative Attacks

The Utah State Legislature adjourned at midnight, March 8, leaving the Public Utilities Commission of the state in the same form as when the session began, several bills to abolish it and others proposing various changes having all failed of enactment.

## Jurisdiction Upheld

**United States Supreme Court Sustains Appeal from Oklahoma Commission to Federal Court**

THE clause in the Oklahoma constitution permitting appeal to the Supreme Court of that state from decisions of the Corporation Commission of Oklahoma does not preclude recourse to the federal courts also where constitutional rights are involved, according to a decision of the United States Supreme Court handed down on March 5. The decision, delivered by Justice Holmes, was in the case of the Oklahoma Natural Gas Company against the Corporation Commission and the case of the Oklahoma Gas & Electric Company and the Muskogee Gas & Electric Company against the Corporation Commission, the two cases being consolidated in the decision, as the questions involved were the same, although they were argued separately.

The companies had applied to the Corporation Commission for an increase in rates established by the commission for natural gas supplied consumers. The applications were denied. The companies then appealed to the State Supreme Court, which under the Oklahoma constitution has the power to hear such appeals and to substitute other orders and grant a *supersedeas* in such matters. The State Supreme Court refused to grant the *supersedeas* and the appeals are still pending before that body. Alleging that present rates are confiscatory, the companies filed suit in the federal district court, asking a temporary injunction against the Corporation Commission to permit higher rates. Three judges heard the application for injunction and refused it on the ground that relief was provided by the state laws. An appeal was then taken by the companies to the United States Supreme Court.

In the decision rendered by Justice Holmes it is declared that the district court followed a precedent which does not apply to these cases. It is pointed out that if the present rates are confiscatory, the companies daily are suffering loss, from which there can be no future redress even if in the future higher rates are granted. The cases were reversed and remanded for further proceedings in the district court, with instructions that the applications for temporary injunctions be heard by that court.

## City May Not Intervene When Utility Sues Commission

A decision with a wide-reaching bearing on the regulation of utilities by state commissions was handed down by the United States Supreme Court March 12, when it affirmed the action of the United States District Court for Southern New York in refusing the petition of the city of New York to be made a party defendant to the suit instituted by the New York Telephone Company against the members of the New York Public Service Commission, the commission's counsel and the Attorney-General of the state to enjoin orders reducing rates.

Two orders of the commission were involved, one affecting rates within the city of New York and the other affecting rates within the state and outside the city. The company, alleging that the proposed rates were confiscatory and in violation of the Fourteenth Amendment to the Constitution, applied for an injunction in the District Court. The city attempted to intervene as a party defendant, but was refused permission by the court. An interlocutory injunction was issued and the decision granting this injunction was appealed to the United States Supreme Court, where it has been argued but not decided.

The decision of March 12 applies only to the appeal of the city against the lower court's ruling as to making it a defendant. In the decision, read by Chief Justice Taft, the Supreme Court holds that the New York Public Utilities Commission has jurisdiction throughout the state, within the city of New York as well as outside, that the city's only interest in the case is that of a subscriber to telephone service, and that even as such its interest in the rate order is not direct as its own rates are settled by a special contract.

## Vote on Pending Milwaukee Contract May Be Had Soon

The proposal for the city to take over the properties of the Milwaukee Electric Railway & Light Company under the service-at-cost plan, with the object of ultimate purchase of these properties by the city, will not be put up to the voters of Milwaukee on April 3, as was intended, according to information just given out by Fred S. Hunt, chairman of the public utilities acquisition committee, inasmuch as negotiations covering several points of importance are still in progress between the committee and attorneys for the company. A special election may be called later in the spring, at which time the people will be asked to pass on any contract finally agreed upon between company and city officials. Mr. Hunt said the new report would differ from the first one made to the council two years ago in that, instead of dealing with the situation generally, terms of a specific contract would be laid down.

## Arizona Rejects Colorado River Treaty

Twenty-two "willful men" stood in the path of the immediate ratification of the Colorado River compact. This, the ELECTRICAL WORLD'S Washington correspondent says, is how one federal official described the action of the Arizona Legislature on March 10, when by a vote of 22 to 22 the bill for ratification failed. The thought in official circles in Washington seems to be that these twenty-two men have taken upon themselves a very grave responsibility, since they have set up their judgment against that of an overwhelming majority. At their door must be laid the blame not only for delaying the development of the whole river, but for continuing the peril of floods, which carries with it the possibility of enormous loss of life and property.

As previously reported in the ELECTRICAL WORLD, the treaty was ratified by five of the seven states concerned—California, New Mexico, Utah, Wyoming and Nevada — and Colorado would almost surely have acted in the affirmative had Arizona done so.

## Wisconsin Utility Men Will Discuss Code

Automatic substations, code requirements affecting transmission lines and supply stations and their effect on the fire insurance rates of electric utilities will be among the subjects to be discussed next week by the electric section of the Wisconsin Utilities Association at the first annual convention of this body, which was organized last year to combine electric light and power, electric railway and gas utilities in one organization. The convention is to take place on Thursday and Friday at the Hotel Pfister, Milwaukee. The morning sessions will be joint ones, and there will be parallel section meetings in the afternoon. The tentative program for the electric sales and accounting sections is as follows:

ELECTRIC SECTION, MARCH 22

*Afternoon.*—Chairman's address, C. R. Phenicie; report of committee on electric meter school, George E. Wagner; report of committee on rural lines, R. G. Walter; "Automatic Stations and Their Application," C. W. Place, General Electric Company; progress report on electrical fellowship, Prof. Edward Bennett, University of Wisconsin; round-table discussion on "Inductive co-ordination," L. N. Boisen, A. J. Goedjen and G. C. Neff.

SALES SECTION, MARCH 22

*Afternoon.*—Chairman's address, A. E. Gerg; "Selling the Commercial Department to the Employees," W. T. Bracken, Beloit; "Business Ethics," Oscar Stotzer; "Manufacturers' Relation to the Sales Department," W. E. Derwent; "Electrical Merchandising," Thomas Casey; address, John F. Gilchrist, Commonwealth Edison Company, Chicago.

ELECTRIC SECTION, MARCH 23

*Afternoon.*—Report, B. F. Lyons, Great Lakes Division, N. E. L. A.; round-table discussion on Wisconsin State Electrical Code: "Features of Particular Concern to the Industrial Commission," John A. Hoeveler, Industrial Commission of Wisconsin; "Important Provisions of the Code Affecting Supply Stations," George G. Post, Milwaukee Electric Railway & Light Company; "Climbing Space, Clearances and Grading Requirements," William H. Damon, Railroad Commission of Wisconsin; "Code Requirements Affecting Transmission Lines," Edward J. Kallevang, Wisconsin Power, Light & Heat Company; "The Code from the City Inspector's Viewpoint," William A. Haig, Milwaukee; "Effect of the Code on Factory Application," George E. Cooper, Allis-Chalmers Company; "Effect of the Code on Fire Insurance Rates of Electric Utilities," Frank R. Daniels, Wisconsin Inspection Bureau; "Employees' Safety Rules," George E. Wagner, Madison Gas & Electric Company; "Important Interpretations and Applications Since the Issuing of the Code," Charles B. Hayden, Railroad Commission of Wisconsin; questions and general discussion of the code, including grounding requirements and other features not already covered.

ACCOUNTING SECTION, MARCH 23

*Afternoon.*—Chairman's address, C. E. Kohlepp; "Consumers' Meter Reading, Billing and Bookkeeping," Indmann P. Marking, Wisconsin-Minnesota Light & Power Company.

## Many Licenses Granted

**Federal Commission Gives Mississippi Sites to Little Falls Company —Feather River Conflict**

CONTRARY to expectation, the Federal Power Commission ruled in favor of the Little Falls Water Power Company in the conflict between it and the Pike Rapids Power Company for sites on the Mississippi at points near Royalton, Minn. It was a case of property rights versus a going concern. The Pike Rapids Company had 80 per cent of the land and flowage rights. There is particular interest in the project since the market for power in that vicinity is growing rapidly. Since the project had not been advertised, the commission will have to pass on it again after the law in that respect has been complied with.

### Rocky Mountain Power to Get Flathead Lake Site

Acceptance of the application of the Rocky Mountain Power Company for a preliminary permit covering the site at the outlet of Flathead Lake will be recommended. The applications of the Montana Water Power & Electric Company and of the Flathead Valley Electric Company for licenses covering that site were rejected. The Rocky Mountain Power Company is affiliated with the Montana Power Company and the Anaconda Copper Mining Company. It is planning a full development. The State of Washington, however, is insisting on certain stipulations, and no action will be taken until after a hearing.

Licenses were authorized for the Washington Coast Utilities Company of Arlington, Wash., covering a transmission line near Waterville, Wash.; for the White & Johnson Construction Company of Denver, covering a transmission line near Glenwood Springs, Col.; for the Minnesota Utilities Company of Eveleth, Minn., covering a transmission line in St. Louis County, Minn.; for the Ante-Up Mining Company of Nevada City, Cal., covering a transmission line in the Tahoe National Forest; for the Southern California Edison Company, covering a short transmission line near Los Angeles; for the San Diego Consolidated Gas & Electric Company, covering a transmission line in the vicinity of Escondido, Cal., and for the Southern Alaska Canning Company of Seattle, covering a minor project at Big Port Walter Falls, Alaska.

The Caddo River Power & Irrigation Company was authorized to assign its license covering the Narrows site on the Ouachita River to the Arkansas Light & Power Company.

A preliminary permit was granted to Lars R. Jorgensen of San Francisco covering a project on Bean Creek, which carries with it four headwater reservoir sites. A conflicting application by L. O. Griffith of Oroville, Cal., was rejected, as were applications by R. T. Harding of San Francisco and the Great Western Power Company. Mr. Jorgensen applied for permits covering six sites at which a total of 350,000 hp. can be developed on the Middle and South Forks of Feather River and on Buck Creek on the North Fork of the Feather River. The commission offered him a preliminary permit for any one of the six projects except the one at Buck Creek, which is in conflict with interests of the Great Western Power Company. That company has a number of developments on the North Fork which the commission believes should be undertaken before the Buck Creek project is developed, because of cheaper unit costs.

The application of the Kootenai Power Construction Company of Wilmington, Del., for a preliminary permit for a project on the Kootenai and Yank Rivers was denied because the commission believed that the project could not be financed. The application of an association of citizens in Batesville, Ark., for a preliminary permit to develop power at United States Lock and Dam No. 2 in the White River was also denied.

The preliminary permit granted James B. Girand for his Diamond Creek project on the Colorado River was extended six months from March 19. Mr. Girand's application for license is being held up pending ratification of the Colorado River compact.

### A Boulder Canyon Project

Formal application has been filed with the commission by G. Henry Stetson for preliminary permits covering developments on the Colorado River which have been the subject of discussion for some time. His proposal for the development of the Boulder Canyon site specifies a rockfill dam 1,064 ft. above the present water surface of the river and the storage of 155,000,000 acre-feet. He estimates that the power capacity of the project will be 1,600,000 hp. In another application he asks for a preliminary permit to build a rockfill dam 70 ft. high at Bull's Head Rock, 40 miles above Needles. He estimates that 160,000 hp. would be developed at that point. The plan is to utilize that power in the construction of the Boulder Canyon dam. Engineers of the federal government who are familiar with the Colorado River situation are not impressed with the scheme proposed, and since it conflicts with most of the plans for the development of the river, the prospects are that these applications will not be granted.

### Appalachian Projects

The Federal Power Commission has applications covering hydro-electric projects in the Appalachian Range alone which aggregate 2,000,000 hp. This does not include the power possibilities of the Delaware, the Susquehanna and the Potomac, which represent more than a million horsepower in themselves. In the area bounded by the Clarion River on the north and the Tallapoosa River on the south there are also many sites which have not been covered as yet by applications to the commission.

In the opinion of the chief counsel of the commission the rights granted under a preliminary permit remain in force until the commission acts on the application. The opinion will come before the commission for approval. If approved, it will prevent the annoyance occasioned by renewals.

## Great Falls Project Again Attracts Notice

With the expiration of the two-year period during which the water-power act gives Congress an opportunity to consider any development which the federal government is likely to undertake, interest again is being manifested in the Great Falls project on the Potomac. Stinemann & Quick of Baltimore are the only actual applicants for a preliminary permit covering that development, but it is understood that other interests are considering the project.

## Kettle Falls Development to Start This Summer

The project of the Washington Water Power Company at Kettle Falls promises to be the first going hydro-electric project on the Columbia River proper. All plans have been completed to go forward with construction this summer. D. L. Huntington, the president of the company, conferred with officials of the Federal Power Commission last week in regard to the license to cover the project. It is understood that J. L. Harper, the chief engineer of the Niagara Falls Power Company, has been engaged as a consulting engineer to assist in the preparation of the plans.

The principal engineering problem involved is the construction of the spillway gates. On account of the restricted channel of the river and the depth of the water, the gates have to be as long as possible in order to avoid interference with spillway capacity on account of the thickness of piers. Mr. Huntington has in mind the installation of gates 75 ft. long and has been visiting projects where the gates are of unusual length. It is believed, however, that there are no existing spillway gates of the length of those proposed for the Kettle Falls project.

## Maine Companies Plan Interconnection

Interconnection of the lines of the Central Maine Power Company and of the Milo Electric Light & Power Company will shortly be accomplished by permanently arranged tie transformer facilities, a temporary connection having been placed in service on Feb. 4. The Milo company owns two hydro-electric plants of about 750 kw. combined rating on the outlet of Sebec Lake, and connects at Dover with the Central Maine company's 33,000-volt lines. Economical use of water on diversified sheds will be made possible by

the interconnection with efficient employment of spare capacity in stations. The hydro-electric plants on the Androscoggin and Kennebec Rivers in Maine have been interconnected for nearly two years, with excellent results in the saving of fuel and water on the Central Maine system, and another advantageous interconection has been in use for still longer between the plant of the Cumberland County Power & Light Company, Portland, and the plants of the S. D. Warren Company in the Westbrook region.

# Wisconsin's Growing Water Power

### Developments Now Proceeding on Chippewa, Flambeau and St. Croix Rivers in Northwestern Part of State—Three Great Holding Interests Concerned

MANY items about the expanding development of the water-power sites of Wisconsin have from time to time appeared in the news columns of the ELECTRICAL WORLD. The total developed water power of the state is now put at 400,000 hp., and the total yet to be developed at approximately 300,000 hp. The most active development is taking place probably in the northwestern part of the state in the Chippewa, Flambeau and St. Croix valleys.

On the Chippewa the Wisconsin-Minnesota Light & Power Company, which owns a 45,000-hp. plant at its Wissota dam, 4 miles above Chippewa Falls, is building a supplementary plant at Jim Falls, still further up the river. This plant will develop 15,000 hp. The Wisconsin Light & Power Company, the operating company for the Kelsey-Brewer interests, controls not only the Wissota and Jim Falls power plants, but two plants on the Red Cedar River, at Menomonie and Cedar Falls, in Dunn County.

The company has also a storage lake at Pa-Kwa-Wong, below the junction of the east and west forks of the Chippewa River at the headwaters, in Sawyer County; the Turtle River reservoir on the headwaters of the Flambeau just below the junction of the Turtle and Flambeau Rivers, in Iron County, and the old lumber drive dams, at present abandoned, at Chippewa Falls and Holcombe on the Chippewa.

BIG FALLS DEVELOPMENT

Another large water-power development in the northwestern part of the Badger State is that at the Big Falls site above Ladysmith in the Flambeau Valley, where a dam is being built by the Lake Superior District Power Company of Ashland, Wis., an Insull property. Although the dam is not yet quite complete, power began to flow from this plant early last December. A 40-ft. head is maintained now, but when the new dam is completed the plant will have a 52-ft. head and a maximum of 16,000 hp. Properties have been purchased and power sites installed by the Insull interests all the way northward to Ashland and the Lake Superior coastal region.

MAP OF HYDRO-ELECTRIC DEVELOPMENTS IN NORTHWEST WISCONSIN

At St. Croix Falls, on the St. Croix River, which forms part of the boundary line between Wisconsin and Minnesota, extensive developments are now under way by the Northern States Power Company, controlled by H. M. Byllesby & Company, to which the Federal Power Commission granted a license. From this site power is to go directly to St. Paul and Minneapolis, 30 miles distant, to the disappointment of Wisconsin communities in the neighborhood of the site, which had foreseen rapid industrial development from its exploitation by a company interested in local development rather than in an urban market in another state.

## Manitowoc Decides to "Go It Alone"

Manitowoc, Wis., which has been facing the problem of how to increase its supply of electrical energy, either a large addition to the municipal plant or a contract with the Wisconsin Public Service Corporation for power from its High Falls hydro-electric plant having become necessary, has finally, through the City Council and after much discussion, declined an offer from the Wisconsin Public Service Corporation to furnish power at the actual cost of manufacture at the switchboard.

The city, some of whose representatives saw in the company's proposal a move to get ultimate possession of the municipal plant, will, according to the Mayor, be in a position to produce power as cheaply as the private company as soon as the additional capacity now determined on is installed. It will then be able to dispose of surplus power to the company, local officials hold, if the company desires to purchase it, but no agreement with the company for helping each other out can be entertained by the city now, as it is operating at full peak load at all times. Under the regulations governing the Public Service Corporation's existing business in Manitowoc the company is barred from supplying consumers using less than 40 hp. daily, this business being diverted to the municipal plant.

Similar conditions as regards the need for more power than the municipal plant can supply exist in Marshfield, Wis., and in Rochester, Minn., in both of which cities the project of seeking relief from the High Falls plant has been discussed. Marshfield has rejected proposals from both the Wisconsin-Minnesota Light & Power Company and the Wisconsin Valley Electric Company to erect high-tension lines to bring in additional power and is advertising for bids for new equipment.

DAM AND POWER HOUSE AT BIG FALLS, ON THE FLAMBEAU RIVER, WHERE 16,000 HP. WILL BE DEVELOPED

## S. E. D.'s Classification of "Electrical Fires"

Fire underwriters and other insurance organizations have expressed interest in the proposed classification of fires attributable to electrical origin which originated with the Society for Electrical Development some months ago, and the Electrical Manufacturers' Council, among others, has indorsed the plan. This classification as recently revised and agreed upon is as follows:

1. Fires caused by defective or improper wiring, substandard apparatus and installations, etc.
2. Fires caused by overfusing and overloading electric circuits.
3. Fires caused by electric flatirons, curling irons and similar devices, worn portable cords, old electrical appliances, etc.
4. Fires caused by street-railway current, automobile electric systems, high-tension power lines, etc.
5. Fires caused by static electricity, lightning and electrical disturbances over which little control is as yet possible.

This scheme not only classifies electrical fires according to their origin, but puts the blame for each clearly and directly on the cause responsible.

## Engineering Museum to Be at Washington

It is regarded as probable that the proposed historical museum of engineering will be established at Washington, with local museums in different parts of the country. The Smithsonian Institution has agreed to act as custodian of existing collections and urges that they be made the nucleus of a great national museum of engineering and industry.

Edward D. Adams and Charles L. Clarke represent the American Institute of Electrical Engineers on the joint committee of the four founder engineering societies having the matter in charge.

## More Industrial Electric Heating Material

Engineers interested in industrial electric heating have been heard from in so many quarters that plans are afoot to publish in the near future the co-ordinated notes of many who took the courses in this subject last year under the auspices of the Power Sales Bureau of the N. E. L. A. and through the co-operation of leading manufacturers of such equipment. V. M. F. Tallman of Charles H. Tenney & Company, Boston, informed a representative of the Electrical World recently that it has been planned to make these notes generally available in the near future. Under the auspices of the N. E. L. A. a "Syllabus of the Industrial Heating Course" held at the Engineers' Club, Boston, in 1921 has now been printed, and Mr. Tallman will be glad to care for orders for copies at $2.50 each. Another useful early publication will be a directory of manufacturers and users of industrial electric heating equipment in the United States.

## Brief News Notes

**Uniform Accounts Ordered in Colorado.**—The Colorado Public Utilities Commission has issued an order that all electrical utility companies doing business in the state shall keep their accounts in accordance with the system worked out by the National Association of Railway and Utilities Commissioners and now in operation in many states.

**N. E. L. A. Tells of Its Activities.**—For the information of members and prospective members the National Electric Light Association has just issued a twenty-eight-page pamphlet explaining its activities, outlining the duties of its various sections and of some important committees and containing other useful information. It is entitled "Activities of the National Electric Light Association."

**Joint Committee to Publish Booklet for Truck Users.**—The newly created electrical transportation department of the Joint Committee for Business Development, of which Charles R. Skinner, Jr., of the New York Edison Company is chairman, has determined upon the publication of a booklet containing data of interest to prospective electric truck users. Members of the department are now at work gathering this information.

**Pacific Gas to Take Over Telephone Company.**—The Pacific Gas & Electric Company has, it is announced, completed arrangements for the acquisition of the California Telephone & Light Company on a basis of exchanging the preferred stocks of the two companies on a par for par basis and the junior stocks on the basis of one share of Pacific Gas & Electric for three shares of California Telephone Company.

**Plymouth, Wis., to Buy Energy.**—Electrical energy is to be purchased by the city of Plymouth, Wis., from the Eastern Wisconsin Electric Company for a period of one year, with the privilege of entering into a ten-year contract at rates quoted by the company. Plymouth had operated a municipal electric light and power plant for many years, but, in view of growing demand, found upon investigation that a great saving could be made by purchasing energy from private sources.

**Hydro-Electric Project on Grand River, Okla.**—Preliminary steps for constructing a dam and hydro-electric plant near Ketchum, on the Grand River, in Mayes County, Okla., are being completed. The project will, it is said, ultimately involve an expenditure of $28,000,000 and will develop 150,000 hp. The fall is 150 ft. The plan is not to build the large dam first, but to build a smaller one further down the river at a cost of $600,000 to provide power while the big dam is being constructed. The company will sell no power at retail but only at wholesale.

**Geological Survey's Figures the Basis.**—Attention is called by the United States Geological Survey to the fact that the figures printed in the Electrical World for Jan. 27, page 239, on the consumption of natural gas for fuel in electric power plants as of September last did not represent an independent investigation by the Texas Public Service Information Bureau, as the item implied, but were merely an analysis of the comprehensive table issued every month by the Geological Survey from figures obtained and compiled by it.

**Montana Utilities May Be Taxed 2 per Cent on Receipts.**—Power companies generating or transmitting electric power in the State of Montana will be taxed 2 per cent of their gross receipts if a bill introduced in the State Legislature becomes law. The bill for the additional tax upon power companies provides that each company, in addition to the reports otherwise required, must submit, at such times and in such manner as may be stipulated, reports and information that may aid in arriving at the true gross receipts.

**Commonwealth Power Corporation.**—Commenting upon the operations of the Commonwealth Power Corporation and its various subsidiaries in the year 1922, President George E. Hardy says that the total sales of electrical energy were 491,257,792 kw.-hr., an increase of 72,164,525 kw.-hr. over 1921. More than 23,000 electric meters were installed in the year. Gross earnings of all the properties were $26,386,030, as compared with $24,863,983 last year, and $4,022,597 was available for dividends, replacements and depreciation, or $16.76 per share of preferred stock.

**Syracuse University to Give Course for Metermen.** — Syracuse University has joined the many now giving spring courses for electric metermen. At the request of the Empire State Gas and Electric Association and the National Electric Light Association the extension division of the university, in conjunction with the Syracuse Lighting Company, is offering a course for the last week of March. It will consist of a combination of lectures, discussions and actual meter laboratory practice. The regular routine of the course will be supplemented by talks by engineers.

**Safety Conference Takes Up Question of Platforms in Front of Electrical Machinery.**—At a recent conference in New York attended by sixty-three representatives of trade associations, technical societies, safety organizations and government departments, which unanimously declared that "it is desirable to have a nationally uniform safety code on walkway surfaces," one of the recommendations was that the sectional committee consider the insulation and non-slip qualities desirable in platforms erected in front of electrical apparatus, with especial reference to switchboards and floors around machinery in motion.

**For a National Hydraulic Laboratory.**—One of the last acts of the Senate committee on commerce prior to the close of the session was to report favorably on the resolution providing for the establishment at Washington of a national hydraulic laboratory. The vote on the bill was unanimous. Although there was no hope of the Senate's taking action at the time the report was made, the indorsement of the committee will improve the prospects of the bill at the next session.

**A New All-Electric Paper Mill.**—In the illustrated description of the electrical equipment of the paper mill of the St. Maurice Lumber Company at Three Rivers, Quebec, which appeared in the March 3 issue, through an oversight no mention was made of the contracting firm which did the electrical work and a large part of the mechanical work in that notable installation. The Canadian Comstock Company, Ltd., New Birks Building, Montreal, was the electrical contractor. In addition to the wiring that company installed much of the electrical machinery and supplied the main switchboard, the transformers, high-tension switching equipment and a large number of motors as well.

**Modesto and Turlock Irrigation Districts in California Reach Agreement Over Power.**—The Modesto and Turlock irrigation districts in central California, which own jointly a power house at Don Pedro, have, after much controversy, at length reached an agreement over operation by which neither will sell power within the boundaries of the other unless one of them decides to wholesale its entire output, in which case the other may enter its territory. The Turlock district is reported to be almost ready to handle the power and distribute it in competition with power companies, it having obtained the permission of the city of Turlock to enter.

**Indian and Dog Team Restore Service to Blizzard-Swept Towns.**—Residents of three Minnesota cities, South St. Paul, West St. Paul and Northfield, thought when wires went down in a recent blizzard that they would have to pass several nights without electricity. Roads and streets were so badly blocked by snowdrifts that it was impossible for the regular repair wagons to get to the scene of the trouble, but by pressing into service a team of seven "huskies" driven by an Indian dog driver, who is also a line patrolman for the Northern States Power Company, the situation was met. A quantity of wire-mending equipment was placed on a sledge, manned by the driver and two repairmen, and in all three cities the break was repaired before night.

**Lightning Arresters Cause Slaughter of Birds.**—A report from the president of the Audubon Society of Florida that the equipment of the St. Petersburg Lighting Company had caused the destruction of at least twenty birds at one spot in that city within a short time led the company to make an investigation. It was found that the slaughter was due to the birds alighting on and bridging horn-gap lightning arresters, which at this point are installed partly in a large tree where the songsters congregate. To save bird life the company has now erected around the arresters simple structures consisting of two rods parallel to the plane of the horn gap but about three inches distant. One of these rods is raised about three inches higher than the horn and bent over it to serve as a perch—as inviting as the one it displaces and much safer.

**To Standardize Symbols and Abbreviations.**—The recent conference held in New York City under the auspices of the American Engineering Standards Committee to consider the unification of technical and scientific abbreviations and symbols revealed a sentiment among engineers, scientists, government officials, business paper editors and industrial executives to aid this movement. It was agreed that the standardization of abbreviations and symbols would result in large mental economies. It was thought desirable to include as a part of the project the graphical symbols which are used in engineering drawings and diagrams for representing instruments and apparatus and components of them. It was also agreed that the co-operation of foreign standardizing bodies should be sought in the development of the work, which will go forward under a committee organization developed in accordance with the rules and procedure of the American Engineering Standards Committee. Twenty-seven societies and other organizations were represented at the conference. Edward J. Cheney, George W. Metcalfe and C. H. Sharp represented the A. I. E. E.

# Associations and Societies

**Florida Engineering Society.**—The annual meeting of this society will be held at Jacksonville on March 19 and 20 in the Hotel Seminole. All interested in engineering are invited, whether members of the society or not.

**Federated American Engineering Societies.**—A meeting of the executive board of the American Engineering Council, executive body of the Federated American Engineering Societies, has been called for March 23-24 in Cincinnati. Government reorganization and reforestation will be among the chief questions to be discussed.

**American Association of Iron and Steel Electrical Engineers.**—This association will meet in Buffalo in September for the first time in its history. The meeting will be held in the Broadway Auditorium, which is now being overhauled and will provide the adequate facilities lacking in previous years.

**Engineering Council of Utah Elects Officers.**—At a meeting of the Engineering Council of Utah held at Salt Lake City on March 3 the following officers were elected to serve for the ensuing year: President, Dr. Joseph F. Merrill, director School of Mines and Engineering, University of Utah, and past-chairman of the Utah Section, A. I. E. E.; vice-president, W. E. Ware, architect; secretary-treasurer, Howard C. Means, State Road Engineer. The Engineering Council of Utah is the largest technical society in the state, representing about fifteen hundred men of the engineering professions.

**Joint Engineering Meeting on Hydro-Electric Power for New York.** — The metropolitan sections of the four major engineering societies are to hold a joint session next Wednesday, March 21, at 8 p.m., when a symposium on "Hydro-Electric Power for New York" will be presented. F. W. Scheidenhelm, consulting engineer, New York, will make a "Co-ordinating Statement of the Problem"; W. S. Murray, formerly chairman Superpower Survey, will give an "Approximation of Available Water Power and Cost of Delivery"; George A. Orrok, consulting engineer New York Edison Company, will speak on "Requirements of Service and Evaluation of Hydro Power"; F. A. Allner, general superintendent Pennsylvania Water & Power Company, on "Quality of Hydro Service," and Lorin E. Imlay, consulting engineer Niagara Falls Power Company, on "Reliability of Long-Distance Transmission." John P. Hogan and W. S. Finlay, Jr., will take part in the discussion, which will be open.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Wisconsin Utilities Association—Milwaukee, March 22-23. John N. Cadby, 445 Washington Bldg., Madison.

Middle West Division, N. E. L. A.—St. Louis, April 11-12. H. M. Davis, Bankers' Life Bldg., Lincoln.

American Society of Mechanical Engineers—Pacific Coast meeting, Los Angeles, April 16-18; general convention, Montreal, May 28-31. C. W. Rice, 29 West 39th St., New York.

Tri-State Water and Light Association—Birmingham, April 17-20. W. F. Steiglitz, Columbia, S. C.

American Physical Society—Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

American Institute of Electrical Engineers—Spring convention, Pittsburgh, April 24-26; annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Sept. 25-28. F. L. Hutchinson, 33 West 39th St., New York.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

Electrical Supply Jobbers' Association—Executive committee and general meeting, Hot Springs, Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

Missouri Association of Public Utilities—River boat from St. Louis to Peoria, May 24-26.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

Ohio Electric Light Association — Cedar Point, June 10-13.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

Pacific Coast Electrical Association — San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

Canadian Electrical Association — Montreal, June 20. Louis Kon, 65 McGill College Ave., Montreal.

American Society for Testing Materials—Atlantic City, June 25-29.

National Council Lighting Fixture Manufacturers—Hot Springs, Va., June 26-28.

# Recent Court Decisions

**Powers of Washington Department of Public Works.**—The Supreme Court of Washington in adjudicating a suit over jurisdiction brought by the Northern Pacific Railway Company against the Department of Public Works, which is the state body regulating utility companies, has held that though the statutes give the department broad powers to rescind or amend any order made, they do not give it jurisdiction to reopen after a lapse of four years a proceeding which has become final because no review was sought by the party injured thereby. (211 Pac. 876.)*

**Damages for Failure to Furnish Electric Service.**—In Huey vs. Wichita Falls Electric Company the plaintiff sought $30,000 damages for alleged breach of contract to light a tract owned by him in the outskirts of the city. A jury awarded him $14,000. The Court of Civil Appeals of Texas has reversed this award and remanded the case because double relief, by both damages and mandamus, was sought and the company's compliance with the writ made the award for continuing and indefinite failure to furnish lighting inequitable. The damages should be such, the court held, as proximately resulted from the delay in getting service. It refused to entertain the plea that the general manager of the company was not competent to make a binding contract in the absence of direct authority from the directors. (246 S. W. 692.)

**Negligence of Electric Company in Placing Guy Wire in Street a Question for Jury.**—The trial judge in Harris vs. Central Power Company, a suit to recover damages for injury caused by collision with a telephone-pole guy wire anchored 2½ ft. from the outer edge of the paving in a 20-ft. alley, held there was no showing of negligence on the part of the company and directed a verdict for the defendant. The Supreme Court of Nebraska, reversing this decision and directing a jury trial, sets forth that where an ordinance requires poles to be placed within or adjacent to the curb line of the street, the fact that the curb line and property line of an alley are the same, and that to place the poles adjacent to the curb line would cause cross-arms to extend over private property is no justification for the company to set its poles out in the paving, for it may either construct its cross-arms to extend from one side of the pole only or procure from private owners permission to let the cross-arms overhang their property. Testimony of experts that the poles and wires were erected according to the method generally approved by electrical engineers does not, the Supreme Court held, conclude the question of whether or not the placing of the guy wires in the alley, at the place and under the conditions in question, was a dangerous obstruction to public travel, negligently maintained, that being a matter within the range of common knowledge. (191 N. W. 711.)

**City Granting Permit for Manholes Has the Reserved Right to Rescind Grant.**—The Georgia Railway & Power Company and the Georgia Railway & Electric Company brought an equitable petition against the city of Atlanta to prevent the municipal authorities forbidding them to make certain manhole installations in the streets of the city which the companies contended were necessary in furnishing electricity. The Supreme Court of Georgia has, on a tie vote, given effect to the decision of the lower court sustaining the city, holding that in granting the original permit for the manholes it reserved the right to rescind the grant. The city did not refuse to allow the companies to open streets for the purpose of constructing conduits and ducts for wires or to construct manholes, but it denied their right to construct transformer stations therein, upon the ground that such stations would usurp one side of the street and interfere with its use for municipal purposes. (115 S. E. 263.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Property Not Used for Utility Purposes Included in Valuation as Basis for Securities.**—The New Hampshire Public Service Commission has permitted the Exeter & Hampton Electric Company to include the whole value of an office building owned by it in a valuation made as a basis for issuing securities, although only part of the building is used for utility purposes. The commission decided that the entire property was a legitimate item in the capitalization of the company, although only that portion devoted to the service of the public could be considered in proceedings for fixing rates.

**Interests of Utility and of Public Identical.**—In its valuation of the Idaho Power Company the Public Utilities Commission of Idaho indicated three "angles of interest" which it must consider—those possessed by the consumers, the investors and the state. In the last analysis, said the commission, these do not conflict. "Whatever is conducive to the real interest of one is equally for the real interest of the others, while the cold, hard, uncomfortable measure of experience proves that any advantage one may gain over the others is temporary merely and invariably costs the one who gets it far more than it is worth. . . . The public can for a time force a level of rates below the point of fairness. By so doing it temporarily reduces the amount paid for service, but there promptly results a rapid reduction of quality and quantity of service. No one, whether it be an individual or a public, can for very long obtain more than is fairly paid for."

**Apportionment of Line Loss.**—Sixty per cent of the entire line loss of an electrical utility, the Midwest Power Company, was charged to the consumers in a village 7 miles distant from the generating plant, the North Dakota Board of Railroad Commissioners holding that the consumers near the generating plant should not be penalized by the excessive line loss to the more distant distribution center.

**Refunding—Amortization of Discount and Premium.**—The Arizona Corporation Commission has authorized as in the public interest the redemption by the Central Arizona Light & Power Company of 8 per cent fifteen-year bonds sold at 90 per cent of par and redeemable at 105 per cent and the issue in lieu thereof of 6 per cent twenty-year bonds at 88.45 per cent of par. The discount and premium on bonds which are refunded should, the commission asserts, be amortized over a period not longer than the life of the refunding bond, as this is part of the cost incident to the refunding process.

**Approving Securities of Interstate Utility.**—A state commission should, according to an opinion rendered by the Vermont Public Service Commission in approving securities to be issued by the Twin State Gas & Electric Company, approve the entire issue of securities for the construction of an interstate transmission line, instead of only that part for construction within the state, when the entire issue of securities for the proposed construction will be based on the properties of the utility in the state and there is no separation of the bonds and shares of stock and the proceeds of the same which will be used in construction in that state from stocks and bonds and the proceeds of same to be used in construction in the other state.

**Fixing Rates for a Utility Which Operates in Two States.**—In determining certain rates to be charged in Wisconsin by the Peninsular Power Company, a utility operating in both Wisconsin and Michigan, the Railroad Commission of the former state considered the total property value and the total earnings and expenses of the company, holding this to be a reasonable method where the characteristics of the business in the two states were alike. In effect the commission declared the rate arrived at proper for the entire property, though, of course, it could authorize it only in Wisconsin. There was only one consumer in Wisconsin affected, an iron-mining company, and the Peninsular Power Company agreed not to put the rate into force against this customer until the same rate shall have been established for its iron-mining customers in Michigan by the commission of that state.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## Albert Emanuel Heads Dubuque Company

Albert Emanuel of New York has been selected to succeed I. C. Elston, Jr., as president of the Dubuque Electric Company. At a recent meeting of the board of directors Mr. Elston, who for some time has been anxious to relieve himself of the responsibilities which for many years have rested upon him, withdrew from active connection with the operation of the utility. More than a year ago he withdrew from the presidency of the investment banking house of Elston, Allyn & Company and also disposed of his utility property at St. Charles, Iowa, and more recently he turned over the management of the electric light and street-railway company at Vicksburg, Miss., to owners of other utilities in the South. Mr. Emanuel, who is the chief executive of utility companies elsewhere in the Middle West, has purchased a controlling interest in the Dubuque company. O. H. Simonds, general manager of the company at Dubuque for the last five years, will continue in that post and in addition becomes vice-president of the company and a member of its board of directors.

**William T. Crawford** has succeeded George A. Peirce as secretary of the Columbus (Ga.) Electric & Power Company.

**Norman W. Mumford** has been elected vice-president of the Savannah Electric & Power Company to serve with Harry H. Hunt and Charles F. W. Wetterer.

**Thomas A. Edison** left his West Orange (N. J.) home on March 8 for his winter home at Fort Myers, Fla., where he will spend six weeks or more. He was accompanied by his wife.

**Judge Warren W. Foster** has been elected chairman of the executive committee of the American Light & Traction Company, New York City, succeeding the late Emerson McMillin.

**Edwin S. Bundy** is now in charge of the engineering department and chief engineer of the Niagara, Lockport & Ontario Power Company, with headquarters at Buffalo. Mr. Bundy joined the company in 1911 and served successively as draftsman, meter engineer, construction foreman and assistant superintendent. Before going to Buffalo he was superintendent of the Eastern division.

**A. T. Pamperin,** for many years president and manager of the Oconto (Wis.) Service Company, which was taken over by the Wisconsin Public Service Corporation recently, has become connected with the headquarters office of the Wisconsin Public Service Corporation in Milwaukee. C. M. Hasseler, who has been connected with the Wisconsin Public Service Corporation for some time, has been made manager of the Oconto company, now known as the Northeastern Power Company, and also of the plant at Peshtigo.

## L. F. Leurey Heads Electrical League

Louis F. Leurey, who has been elected president of the San Francisco Electrical Development League for the ensuing association year, as was announced in the Feb. 24 issue of the

L. F. LEUREY

ELECTRICAL WORLD, is a well-known figure in the electrical industry in the West. He is a graduate electrical engineer of Tulane University, New Orleans, La., with the class of 1902. The next two years were spent in the testing department of the General Electric Company. From 1904 to 1913 he held important engineering positions with the following companies: New Orleans Railway & Light Company, Spokane & Inland Railroad, Stanislaus Power Company of California, Sierra & San Francisco Power Company, British Columbia Railway Company and British Columbia Electric Company. Mr. Leurey is perhaps best known through his work with the Panama-Pacific International Exposition, held in San Francisco in 1915, where as assistant chief mechanical and electrical engineer he had direct charge of all field installation and operations. Since 1917 he has been engaged in consulting electrical engineering work, with offices in San Francisco. During this time he has been retained by many large electrical, industrial and mining companies of the West.

**S. Z. Mitchell,** president of the Electric Bond & Share Company, has been elected chairman of the board to fill the vacancy caused by the resignation of Marsden J. Perry. Mr. Mitchell will continue to serve also as president. F. B. Odlum and Frank Silliman, Jr., have been elected vice-presidents of the company.

**Joseph Bowes,** superintendent of the Port Arthur (Tex.) division of the Eastern Texas Electric Company, a Stone & Webster property, will be transferred to the office of the same company in Beaumont, Tex., to be general superintendent. Mr. Bowes entered the employ of the Port Arthur company in 1916.

**W. J. Hodgkins,** who has been general manager and superintendent of the Ashland Light, Power & Street Railway Company for a period of many years, recently was elected vice-president of the Lake Superior District Power Company with headquarters at Ashland. Mr. Hodgkins is widely known in utility circles in Wisconsin and the surrounding states.

**B. R. Farrand** has been appointed power engineer of the Connecticut Power Company, with headquarters at New London, Conn. Mr. Farrand, who has been on the power engineering staff of the Hartford (Conn.) Electric Light Company since June, 1919, was graduated in 1918 from the Sheffield Scientific School of Yale University in the electrical engineering course.

**M. Seki,** secretary to Viscount Mayedo, Minister of the Department of Communications of Japan, is en route from New York to San Francisco, where he will sail for home. He came to the United States from Europe after touring the principal cities, making a special study of hydro-electric plants. He is continuing his study of such plants in cities along his route across the United States.

**H. L. Myer,** who has been superintendent of construction on Mitchell Dam for the Alabama Power Company for the past two years, has resigned to join the Sanderson & Porter Company as superintendent on the Springfield steam plant of the West Penn Power Company. Mr. Myer will report to H. L. Polk, who was resident engineer with the Alabama Power Company on the construction of Lock 12. C. C. Davis, who has been night superintendent, has been appointed general superintendent.

**N. B. Ambler,** superintendent of the Toronto Power Company, Ltd., Niagara Falls, Ont., for the last ten years, has recently joined McClellan & Junkersfeld, Inc., engineers and constructors. J. T. Brusky, formerly with Stone & Webster, Inc., and the American International Shipbuilding Corporation, has also allied himself with the engineering firm. Other recent additions to the staff are Harrison E. Kleffel, who was associated with the Peabody Engineering Corporation, New York City, and Thomas Richardson, formerly with the M. W. Kellogg Company, New York City.

**J. E. Brokemyr**, who has been connected with the Utah Power & Light Company, is now in the drafting department of Stone & Webster, Boston.

**Clarence Auty**, formerly with Carver, Macomber & West, is now associated with Charles H. Tenney & Company as assistant electrical engineer.

**H. S. Russell**, until recently with the St. Joseph (Mo.) Railway, Light, Heat & Power Company, is now with the Virginian Power Company, Charleston, W. Va.

**Elliott G. Peabody**, recently connected with the Haverhill Gas Light Company, a Stone & Webster property, has been transferred to the statistics department of the organization.

**J. L. Kirkpatrick** has resigned his position with the American Telephone & Telegraph Company to become general manager of installation of the Western Electric Company, with headquarters in New York City.

**G. R. Thompson**, formerly salesman with the Electric Appliance Company of San Francisco, has recently left that company and is now acting as salesman for the Western Electric Company with headquarters in San Francisco.

**Tylor M. Barr** of Lisbon, N. Y., who has been with the General Electric Company for the last five years as illuminating engineer, has been appointed lighting specialist of the Hudson River Gas & Electric Light Company, with headquarters at Poughkeepsie.

**W. E. Barrett**, formerly of the Denver Gas & Electric Light Company, has been appointed to the publicity department of the Westinghouse Electric & Manufacturing Company in the Rocky Mountain region, with headquarters in Denver.

**K. E. Van Kuran**, district manager of the Westinghouse Electric & Manufacturing Company and vice-chairman of the California Electrical Co-operative Campaign, retired from the presidency of the Los Angeles Electric Club on March 5. Mr. Van Kuran was elected president a year ago to preside over the club's activities during the second year of its history.

**A. L. Spring**, formerly field representative of the California Electrical Co-operative Campaign in southern California, has joined the staff of the General Electric Company in Los Angeles as merchandising superintendent. Prior to his connection with the co-operative campaign Mr. Spring was sales manager in the Los Angeles office of the Western Electric Company.

**Benjamin Franklin Meissner**, who has been director of the phonographic research laboratory of the Brunswick-Balke-Collender Company since 1920, left that post on Feb. 15 to become chief engineer of the radio division for the Multiple Electric Products Company, Newark, N. J. Mr. Meissner's ability as an engineer and radio expert gained recognition several years ago as a result of his co-operation with John Hays Hammond, Jr., in the perfection of the wirelessly controlled torpedo.

**F. E. La Roque** has recently been appointed superintendent of the Ticonderoga (N. Y.) Electric Light & Power Company, succeeding Austin Moyes, who resigned.

**Philip P. Wells**, secretary of the National Committee for the Defense of the Water-Power Act, has been appointed a special attorney for the State of Pennsylvania to handle water-power matters.

**Jackson C. Phillips** of the steam-engineering department, Narragansett Electric Lighting Company, Providence, has been appointed betterment engineer of the Electric Bond & Share Company, with headquarters in New York.

**W. D. Smith**, formerly superintendent of the Middletown division of the Connecticut Power Company and until recently stationed at New London, has been appointed general superintendent of the Houghton County Electric Light Company, Houghton, Mich.

**L. G. Webb** has resigned his position as district manager of the Menomonie office of the Wisconsin-Minnesota Light & Power Company to engage in the real estate business. Mr. Webb has been associated with the company for four years and has been in charge of the Menomonie office for two years.

**Fred A. Larson**, who has been with the Titusville Light & Power Company for a number of years, has been made city electrician for Titusville, Pa., succeeding George B. Heron. Mr. Heron is now associated with the Westinghouse Electric & Manufacturing Company.

**Adolph Kanneberg**, Milwaukee attorney, has recently been appointed by Governor Blaine of Wisconsin to membership on the Wisconsin Railroad Commission, succeeding Carl D. Jackson, resigned. Mr. Kanneberg's term will be for two years.

**H. P. Sleeper**, formerly of the supply engineering department, Westinghouse Electric & Manufacturing Company, has entered the employ of the Duquesne Light Company, Pittsburgh, in its engineering department. Mr. Sleeper will handle the protective work of the light company. During the four years that he was with the Westinghouse company Mr. Sleeper devoted most of his time to work on protective relays. He is a graduate of the University of Maine of the class of 1915.

**Otis L. Johnson**, engineer and lecturer on illumination for the Benjamin Electric Manufacturing Company, has been appointed commercial engineer for the King Manufacturing Company, Chicago. Mr. Johnson attended the State University of Iowa, going from there to the engineering department of the National Lamp Works of the General Electric Company at Cleveland. In 1912 he resigned to accept the position of illuminating engineer with the Benjamin Electric Manufacturing Company, which position he held until recently. Mr. Johnson has been an active worker on committees of the National Electric Light Association and the Illuminating Engineering Society and is now a vice-president of the latter organization.

**Jack Fiester**, formerly with the Idaho Power Company at Pocatello, has joined the Salt Lake City office of the Edison Electric Appliance Company as range sales specialist.

**V. Y. Davoud** has been transferred to the engineering department of the Electric Bond & Share Company, New York City. He was formerly with the Utah Power & Light Company, Salt Lake City.

**J. B. N. Cardoza**, formerly with the Walker Vehicle Company, has become general sales manager of the Walter Motor Truck Company and in connection with that position has organized the Electric Truck Transportation Corporation, of which he is president. Mr. Cardoza has been actively identified with the promotion of the use of the electric truck for many years and has served on several committees of the N. E. L. A.

**Joseph Stansbury Jones**, general commercial manager and assistant to the president of Charles Cory & Son, Inc., was elected vice-president of the company at the February meeting of the board of directors, to succeed Franklin Washington Wood. Mr. Wood, while not now active, is a director. Mr. Jones resigned from the Navy Department as senior electrical expert aid in 1919 to become associated with the Cory corporation. His many years of varied experience with engineering problems pertaining to the navy and merchant marine have eminently fitted him for the new duties he assumed March 1. He has filled the rôle of electrical draftsman, electrical expert aid, assistant electrical superintendent and acting electrical superintendent. Mr. Jones has to his credit several important patents in electro-marine devices and is the author of technical and scientific treatises for the Navy Department covering various types of signaling and power equipment.

# Obituary

**Oscar E. Perry**, superintendent of the meter department of the Narragansett Electric Lighting Company, Providence, died recently after twenty-three years' service with the company. He was sixty-five years of age and was very active in company organizations.

**William Penn White**, identified for the last eleven years with the railway department of the General Electric Company at its New York office, died recently in the Garfield Hospital, Washington, following an operation. Mr. White was born in Washington in 1876. After being graduated from the Lehigh University with the degree of electrical engineer, he entered the employ of the General Electric Company at Schenectady. He served in the testing department, the calculating and drafting department and was then transferred to the railway engineering department. In June, 1912, Mr. White was transferred to the New York office.

# Manufacturing and Markets

Devoted to the Discussion of Business and Economic Problems of the Producer and Distributor, with Market Reports, Trade Activities, Foreign and Construction News

## Motor Sales by Contractor-Dealers

**Co-operation Secured for Central-Station Company by Letting Out Motor Business Is Worth Far More to the Utility Than the Profits Derived**

A VIGOROUS discussion of the policy of selling electric motors through the contractor-dealer recently brought to a focus a problem in trade relations which deserves consideration. It was pointed out that in some territories central-station companies maintain stocks of motors and sell them to industrial power customers in connection with investigations and subsequent contracts for service, while neighboring utilities turn the motor business over to the contractor-dealer and thereby accord such profit as may exist in the apparatus sale to the successful bidder on the wiring contract. A number of points were brought out in this discussion, which occurred in an informal conference, that are of interest in connection with the broad question of relations within the industry and the problem of economical distribution.

It was asserted that the co-operation gained for the central station by turning over motor business to the contractor-dealer is worth far more to the utility than the profit derived from the sale of the equipment. The manufacturer profits in either case, selling to the central station and to the dealer at a discount which need not be discussed here, but which offers roughly the same margin for each. The central station is responsible for the kind of business it adds to its lines and performs a useful service in power engineering analysis—or should do so—before any comprehensive motor installation is made.

### Giving Customer Service

It was recognized that unless the contractor-dealer performs a service in connection with a motor selection and installation, or in subsequent operation, there can be little gain through routing motor sales via his office. In many cases the contractor may be qualified to advise as to selection and in other instances not. On the wiring job he comes into his own, although the central station acts as a consulting engineer in relation to this work in industrial power applications, but in the last analysis the question of "servicing" the motor was declared to be the logical criterion of sales priority. The point was made that very few central stations maintain motor-service stations, even when they carry stocks of motors, whereas the well-equipped contractor-dealer handling such apparatus is either prepared to make good when a demand for parts arises or else to furnish a substitute motor until the one withdrawn from service can be replaced.

Two instances were cited where the central station had turned over its entire motor-sales business to contractor-dealers. One was in a city of more than 100,000 people, the other in a town of over 15,000. In both cases, it was stated, the contractor-dealers have prospered as a result of this change in policy. In the city enough spare parts or odd motors are carried to tide over emergencies with ease, and the contracting organization most successful in this work maintains a force prepared to render immediate restoration service to motor users in the local industries. There are almost always cases of regrouping of motors resulting from the growth and changes of industrial plant conditions within the place which make it possible to tide over local trouble until a motor suited to the job can be obtained. In the town it is not so feasible to carry motor stocks, but thus far the temporary substitution of motors not necessarily adapted to the job in size but available for one reason or another has met the situation nicely. Inefficiency in temporary applications of motors is not of long duration, and the contractor-dealer organizations are prosperous and work in close touch with the central station. This concord tends to result in mutual co-operation in the selection of motors for a given service and in complete information being given the central station regarding all motor changes or purchases of motors to go into existing plants. Increased interest in the solicitation of new power business is evident in the contractor-dealer branch of the industry. The central station knows the price situation, passes technical judgment upon the layouts proposed and is freed from the necessity of maintaining motor-part stocks.

### Took Over Burden of Routine

In one case where several hundred horsepower in motors was distributed among more than thirty small industrial concerns in a single sales proposition the routing of the sale through the contractor-dealer who was the successful bidder on the wiring job saved the central-station engineering department at least two weeks' work on minor details of the installations. Out of his profit on the motor sale the contractor-dealer took over the burden of routine installation in all its aspects. These purchasers will naturally turn to the contractor-dealer for future servicing of motor and control apparatus, and the central station will be kept in constant touch with the use and development of the installations involved. To not a few central stations the profit on motor sales weighs heavily in the scale when it comes to a decision to change the policy on behalf of the contractor-dealer, but the question is a live one and the purchaser of such equipment seemingly can be adequately served if the man who does his wiring also supplies him with motor and control equipment. A possible exception may arise on very extensive jobs in which the manufacturer's sales engineers figure as co-investigators with the central-station power sales department, resulting as they may in direct orders from the ultimate owner of the motor.

# Burden of Special Transformer Orders

**Engineers Specify Excessive Features That Bring Not Economy but Expense—Add 25 per Cent to Discourage Freak Designs**

BY A MANUFACTURER

THERE are probably forty-thousand different designs of transformers made today, owing in no small part to avoidable ordering of freak sizes. The engineer, not having on his mind the problems of production which confront the manufacturer, orders a transformer with specifications calling for extra taps that will provide for special voltages which he thinks might some day be desired. The salesman knows that the factory tries to avoid these "special" orders, but in his desire to please his customers he sacrifices the principle and takes the order. He fears that the purchaser will think he is trying to substitute something easier if he urges a standard unit. He forgets and does not explain to his customer that transformers have been standardized in type and size for the most definite of practical reasons.

### WIDE RANGE AVAILABLE

As it is, there are about ten voltages, three cycles and seventeen sizes up to the 200-kw. transformer. There are something between 150 and 200 sizes in all, which multiplied by voltages and cycles produce an almost endless variety from which selection can be made. But the bulk of the business, of course, comes in a comparatively small number of standard types which good use has proved the most convenient, economical and practical and which through standardization in production can be manufactured most efficiently. When the customer orders something special with extra taps to provide for extra voltages, therefore, it increases the cost of manufacture, in many cases out of all proportion to any practical value which this special feature may provide.

There are sometimes, of course, valid reasons for ordering to special design. California operates for the most part at 50 cycles, Niagara power is 25 cycles, New York State takes some 40-cycle equipment, and there are cases of high altitude or some other local condition that require special provision. But for all ordinary service these freak transformers are not required and accomplish little more than to make the manufacturers' job more difficult, which reacts inevitably upon the customer. For each of these special requirements means a special design which costs money. It requires special handling through the factory, which adds expense. It clogs up the manufacturer's engineering department and delays the completion of quotations and other items of service. It slows delivery, particularly in rush times.

There are times when a power company may be planning to change the voltages on a line, say from 33,000 to 66,000, and may rightly prepare by providing extra taps on all transformers. Yet orders are often given to provide taps for 10,000 volts and 40,000 volts which can hardly relate to any such plans in prospect. Rather, the engineer is probably thinking to provide an element of interchangeability, so that he need carry only a few sizes in stock.

But since this has to be all special stuff, it adds greatly to the cost, and it would pay far better to keep a larger stock of spares on hand in order to take care of possible breakdowns and to buy standard transformers.

It is general practice to add 25 per cent to the cost of special transformers in the effort to discourage this demand for freak stuff, and it is in fact a matter of discouragement. Some salesmen take very few orders for special designs, while others take many, showing a realization of the condition and the degree to which each salesman takes upon himself responsibility for protecting the customer and the factory from this extra cost.

### WAR BROUGHT EXTRA SIZES

The war brought in a demand for a number of special transformers to meet sudden and unusual needs, and the manufacturers cheerfully met the need and produced whatever was required. The profit which the manufacturer is making today is far below the profits earned then, but we are still carrying varieties and designs and providing extra taps and series and parallel connections that add greatly to the cost. It is a condition that should have the very serious attention of all those who make or wholesale or of those who purchase transformers.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## Switch Sales Gained 10 to 15 per Cent in Six Months

According to leading authorities in the field, present sales of push and rotary flush switches are running from 10 per cent to 15 per cent ahead of the sales of six months ago. Deliveries are still longer than normal owing to very poor transportation conditions both in shipping and finished product and getting raw material. This condition is apt to improve considerably, however, during the next thirty or sixty days because of smaller coal shipments and the releasing of more rights-of-way and railroad equipment for other commodities.

Some slight price changes have been made during the last month or two, such changes having been upward. Raw-material prices, including porcelain, brass and copper, show an upward tendency, which may have to be reflected in advanced selling prices of finished products.

The outlook for the next six months is very good, owing to the fact that the building program of the last six months of 1922 was exceptionally high, and that will naturally be reflected in business for the first six months of 1923. Furthermore, the trade in general is pretty well acquainted with the upward tendency of basic material costs and, drawing from that the conclusion that finished products will be advanced, is buying with advancing prices.

### SAFETY TYPES VERY ACTIVE

Present sales of safety switches, according to several manufacturers in that line, are running between 35 per cent and 50 per cent ahead of six months ago. This increase in sales is attributed to the increased use of standardized switches, more industrial activity and a greater number of salesmen employed in merchandising. Deliveries are reported to be a little bit longer than normal. There have been some price reductions during the last few months, but the outlook in the switch market now is that there will be no

further changes in the near future. As the building season opens a corresponding increase in business is expected. Indications are that there will also be a lot of industrial building done during the coming summer months.

## New England Collections Well Maintained

With improved business in virtually all lines of industry, collections in New England electrical circles are being well maintained. Outstanding accounts are being cleaned up in about seventy days. Bad weather and poor transportation and highway conditions have slowed down payments in northern districts to some extent, but on the whole money is fairly easy. Railroads are meeting their obligations more readily as far as electrical purchases are concerned. Industrial plants and central stations are causing jobbers and manufacturers little anxiety, but in contractor-dealer circles some delays are evident. Competition among jobbers is keen and close watching of accounts is general. The outlook is excellent for an active spring and for a plentiful supply of funds for well-rounded business development.

## Netherlands Electrical Industry Reported Sluggish

Conditions in the electrotechnical industry of the Netherlands indicate a general tendency toward a decline in production, although renewed activity prevails in several of its branches. The industry on the whole is considerably better off than some others in that country.

Lamp and lighting-fixture manufacturers, as well as makers of telephone apparatus and parts, report that conditions are substantially the same. One lamp company, however, recently took on about four hundred additional workmen and another has re-employed a number of men discharged several months ago on account of the slackness in that line.

The Netherlands industries are unfortunate in being subject to keen competition from neighboring low-exchange countries. A general import duty of 5 per cent is levied, which, according to a statement of the Netherlands Association of Electrotechnical Producers, does not give sufficient protection. So far no action has been taken by the government to provide any increases in the duties.

## Insulating-Material Business Increased 35 to 45 per Cent

The insulating-material market is reported to be advancing nicely, with sales from 35 to 45 per cent in excess of those for the corresponding two months of last year. Deliveries are at normal periods, with little trouble experienced in transportation through the interior. Sales prices of special products in the insulating-material market have not changed recently, but, in the opinion of leading manufacturers, it may be necessary to increase prices in the near future owing to the considerable increase in the price of raw materials due to the higher import taxes assessed under the new tariff.

## Conduit Stocks in St. Paul-Minneapolis Extremely Low

The conduit market in the St. Paul-Minneapolis territory is seriously hampered by low stocks. The demand is not only active to supply present needs, but is actually feverish. It is estimated that there is less than half a carload of ½-in. conduit in the Twin Cities today and no more than five carloads of sizes up to an inch. Jobbers are furnishing ¾-in. pipe at ½-in. prices and galvanized pipe at black prices. Recent shipments of mine-run pipe have included no small pipe or very small percentages of anything under 1 in. Unless shipments improve very much by the springtime electrical work will be seriously handicapped. Jobbers declare that the increase in shipments of some small-sized conduit must be almost revolutionary if the spring demand is to be anywhere near satisfied.

## Cessation of German Competition in Japan

German competition in heavy electrical machinery sold in Japan has entirely disappeared, according to Acting Commercial Attaché H. A. Butts, Tokyo. Public statements made some time ago to the effect that Japanese buyers were inclined to place orders for this class of machinery with German manufacturers appear to have been only partly true, and Mr. Butts now states that no reliable Japanese company of which he knows is either quoting or endeavoring to secure the business for this sort of equipment of German manufacture.

Japanese consumers prefer the American product, with its dependability as to deliveries and quality. In this connection a representative in Japan of one of the leading American manufacturers states that he has no difficulty in securing orders for American products with a 10 per cent premium over the cost of the same article manufactured in Japan. At present about 80 per cent of the imports of heavy electrical machinery into Japan are from the United States.

## High-Tension Equipment Makers' Heavy Orders

High-tension equipment manufacturers in the Chicago territory continue to ship heavy orders. Last week a leading manufacturer sold two 11,000-volt, 3,000-kw. substation switching centers for the South and a large order for 135,000-volt air-break switches for the Middle West.

Another firm reports orders for 6,600-volt indoor switching equipment for the East and a 33,000-volt, 1,000-kw. outdoor substation for the Middle West. Call for farm-line equipment is improving and manufacturers feel that 1923 will yield active business on this line.

## The Metal Market

**Copper Less Active—Prices Are Sagging — Lead Continues Strong — Railroad Embargoes Troublesome**

The week has been a little more quiet in the metal market than were the two or three previous ones. Prices in the last day or two have shown a tendency to sag slightly in the case of copper and zinc, but lead continues active. Railroad embargoes are still troublesome, practically all transportation east of Buffalo being affected. There is not only a shortage of cars, but locomotives also are not available.

NEW YORK METAL MARKET PRICES

| | Mar. 7, 1923 Cents per Pound | Mar. 14, 1923 Cents per Pound |
|---|---|---|
| Copper | | |
| Electrolytic | 16.75 | 16.75 |
| Lead, Am. S. & R. price | 8.10 | 8.15 |
| Antimony | 7.62½ | 8.75 |
| Nickel, ingot | 30.00 | 30.00 |
| Zinc, spot | 7.30 | 7.50 |
| Tin Straits | 42.00 | 46.00 |
| Aluminum, 98 to 99 per cent | 24.00 | 25.50 |

Copper buying has not been so active this week, consumers evidently feeling that a reaction in price was about due after the rapid advances. Speculative holders of copper in London were quick to sense the slight dullness and put metal on the market, which caused the price to fall considerably.

## Copper and Brass Products

Copper, brass and bronze mills quote the following prices on brass and copper products:

Copper wire, 19.37½ cents, mill; brass wire, 21.62½ to 23.37½ cents; copper sheets, 23.75 cents; copper rods, 19.62½ cents; brass rods, 19.37½ to 23.62½ cents; sheet brass, 21.12½ to 22.87½ cents.

## Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb | $0.0312 | $0.0303 | $0.0247 |
| Cold finished shafting, per lb | 0.0402 | 0.0383 | 0.0330 |
| Brass rods, per lb | 0.1804 | 0.1766 | 0.15 |
| Solder (half and half), per lb | 0.2617 | 0.2508 | 0.20 |
| Cotton waste, per lb | 0.1181 | 0.1181 | 0.106 |
| Washers, cast iron (½-in.), per 100 lb | 4.33 | 4.33 | 3.83 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 2.96 | 2.96 | 3.11 |
| Machine oil, per gal | 0.349 | 0.349 | 0.40 |
| Belting, leather, medium, off list | 49% | 49% | 46⅓% |
| Machine bolts, up to 1-in. x 30-in., off list | 51⅓% | 51⅓% | 64⅓% |

# The Week in Trade

Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points

BUSINESS in the Southern and Eastern sections is reported to be improving gradually, while orders received during the past week in the Northern and Western sections are below or only equal to the amount of those of one or two weeks ago. In the New York and Portland-Seattle territories greater interest is being shown in aluminum wire for transmission purposes following recent heavy markings-up in the copper market. The appliance market is reported fair with greater interest shown in the East, where many new apartment houses and single dwellings are being rapidly completed. Meters are moving in greater volume to central stations, which are taking on many new customers in all parts of the country. A large amount of "proposition" work is being developed following added interest in industrial power applications.

**Boston** Activity is more pronounced in electrical circles from week to week, paralleling the expansion of general business. Prices stiffened last week in armored cable, pole-line hardware and wiring devices. The shortage of rigid conduit continues to inconvenience builders. Deliveries on power transformers are lengthening, thirty-eight weeks being quoted on 1,500-kw. units last week. Price cutting in radio supplies continues, but the higher-grade material holds firm. Central stations are buying more meters, and electrical merchandise is moving well at retail. House-wiring jobs are increasing in many localities. Industrial power applications are developing a large amount of "proposition" work, and motor sales are reflecting better business conditions. Labor is getting scarcer, with accompanying demands for increased pay in the building trades.

**New York** Demand for all electrical materials entering into new residences is increasing from day to day. A noticeable spurt in interest by utilities for line materials is reported. With the rising prices of copper wire there is greater buying in the aluminum wire market. Slight markings-up in prices of pole-line hardware, armored cable and wiring devices were made during the week. Demand for meters is increasing with the completion of many new apartment houses in the metropolitan area. Prices for complete radio sets of the better makes are holding firm, while parts generally are considerably lower than one month ago. Outstanding accounts are running to sixty-five days.

**Atlanta** No changes of moment in the electrical jobbing line were witnessed during the past week. The demand for conduit is very brisk and stocks are spotty. One jobber reports the receipt of shipments sufficient to bring his stocks up to normal, while another says that his stocks continue low. Prices are unsteady, orders being taken subject to market quotations on date of shipment. Jobbers handling telephone equipment report a healthy volume of business with stocks ample to meet the demands. Because of the unusually warm winter, when for the greater portion of the time it was unnecessary to run furnaces for heating, air-heater sales have been good and stocks are almost depleted. Most of the large central stations in the Southeast are actively in the merchandising field, and a steady increase in the demand for lamps and appliances is to be noted. The price of cotton continues to climb, with no limit in sight, and this is being reflected in optimism in the rural communities. Taken as a whole, the entire line of the electrical trade reports business booming.

**Baltimore** Prospects are taking on a much brighter aspect. Contractors are estimating on considerable work for which contracts will be let in the near future. Motors, transformers and condensers have been holding their own during the past week, and a slight improvement is noted in radio equipment. The market on lamps has decreased considerably and all heating apparatus is practically off the market. There seems to be a picking-up in commercial fixtures. Conditions on the whole are very slightly changed.

**Chicago** The general demand for electrical equipment continues steadily. The price of flexible armored cable was increased the first of the week, and all wiring materials have an active call. Demand for radio equipment is active and stocks are in good shape, although there is a scarcity of the 1.5-volt vacuum tubes. Rectifiers have a steady sale so that stocks are not high. Gains in industrial employment for 240 manufacturers in the Seventh Federal Reserve District for January totaled 1.8 per cent in men and 8.7 per cent in payrolls over the December returns.

**St. Paul-Minneapolis** A general falling off in business is noticeable this week. Business, however, is better than a year ago, but below last month. This quiet period is declared natural considering market conditions in this territory. Most jobbers think heavier buying will start early in April. Home building is progressing nicely. Prices for wire show continual rise. Radio demand is falling off. Dealers are cutting prices to clean up stocks. It is impossible to get rectifiers and little relief is seen in the conduit stock situation. High-tension equipment and construction materials are quiet, but queries are numerous.

**St. Louis** The building permits for the month of February amount to $2,664,900, which is an increase of approximately 107 per cent over the month of February, 1922. The building permits for factories and workshops alone amounted to $1,370,690 compared with $41,400 for the same month last year. This impetus in industrial building is probably due, in a large measure, to the recent municipal bond issue for $87,000,000. Electrical contractors and jobbers are anticipating exceptionally good business to result from the electrical exposition held in the Coliseum from March 12 to 17 and are making preparations to take care of it. The shortage of wire continues while prices are climbing.

**New Orleans** An immense building program is forming here. Last year's fire losses in New Orleans were nearly $7,000,000, a record-breaking total. This building must be replaced and new structures are needed to meet the demands of the increasing business and increasing population. The effects of this building program have not yet made themselves strongly felt on the electrical trade, because construction for the greater part of the program has not yet reached the contractors. They will be felt, however, within the next few months.

**Salt Lake City** Reduction of freight rates to the Pacific Coast to meet competition via the Panama Canal will benefit intermediate jobbing points. The long-and-short-haul clause of the transportation act gives the Intermountain region advantages. The new schedule will be effective April 17, and it is believed it will have the effect of reducing prices on many lines manufactured in the East. Comparison of building statistics for the month of February, 1922, with 1923 shows that there has been an increase of construction work begun amounting to 400 per cent.

**Pittsburgh** Business from contractor-dealers and industrial firms continues brisk. Radio business seems, in a retail way, to have reached a healthy condition, and the demand is steady. The people now are buying a better class of sets and material than before. During the week there have been decided advances in armored cable, wiring devices and pole-line hardware. This contemplated increase has stimulated buying in these particular commodities among the jobbers and contractor-dealers. The greater amount of business among the contractors seems to be in small house wiring. Each jobber has reported a steady increase in business over the same period for 1922.

# Demand, Supply and Price Trend of Nineteen Commodities as Sold in Sixteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Next Week Reports will include Tape, Batteries and Irons

**Cleveland** Most jobbers report the week just finished as the best thus far of 1923 and sales in excess of those in the same week last year. Particular strength in industrial equipment is noticed. Conduit boxes are in strong demand. Central-station companies have plans under way to increase power production to meet growing demand. Radio dealers as well as jobbers report an active week. Rectifiers are moving fairly well, but signal apparatus sales are rather spotty.

**Denver** General business continues to improve. In mercantile lines growing volume of business is reported. Increases in ore values are stimulating activity in metal mines, and coal mining is proceeding at a high percentage of full-time operations with the situation clarified by an extension to April of contracts between operators and mines. Loading of coal cars is increasing weekly. Crude-oil production is in greater volume than a year ago, while flour-milling and meat-packing operations are exceptionally heavy. All branches of the electrical industry as a result of these improvements are profiting accordingly.

**Portland-Seattle** Construction throughout the Northwest is very active. As a consequence lumber production is 10 per cent to 20 per cent above normal and the demand for electrical equipment is growing rapidly. Central stations are in the market for a large amount of equipment. The rising price of copper has had a tendency to create more interest in aluminum for transmission lines. Jobbers generally report very good business. A slight seasonal lull is being experienced at this time, but sales are appreciably better than a year ago. Radio is apparently very active in the better class of sets.

**San Francisco** Many price advances are recorded. Push switches, sockets, sign and weatherproof receptacles have climbed about 10 per cent. Solder has advanced because of lead-base increase with indications of further advances. Dealers report good sales of flatirons. Clotheswasher lists have changed, dealers' average profit having risen from about 30 per cent to nearly 40 per cent during the past year.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Westinghouse and Baldwin to Revise Agreement

The several-years-old agreement between the Baldwin Locomotive Company and the Westinghouse Electric & Manufacturing Company which called for co-operation in the manufacture of electric locomotives will be extended along revised lines, according to officials of these companies, because of the greatly increased demand for electric locomotives. The production has not kept pace with this demand.

It is predicted that orders for electric locomotives will be especially large in foreign countries where hydro-electric development is in progress. The movement is expected to expand for the purpose of economy of operation as well.

The American Locomotive Company recently entered into a similar agreement with the General Electric Company.

## Electric Storage Battery Declares Quarterly Dividend

The Electric Storage Battery Company, Allegheny Avenue and Nineteenth Street, Philadelphia, announces that its directors have declared a quarterly dividend of $1 per share from the accumulated surplus of the company on both the common stock and the preferred stock, payable April 2, 1923, to stockholders of record of both these classes of stock at the close of business on March 17.

## Robbins & Myers Change in Advertising Directorship

The Robbins & Myers Company, Springfield, Ohio, manufacturers of electric motors, generators and fans, have announced the appointment of H. H. Beck as its advertising manager.

Mr. Beck came to Robbins & Myers from Erwin, Wasey & Company, Chicago, advertising agents, with which concern he had been associated for the last few years. His connection with the Robbins & Myers Company became effective on March 1.

## Changes in Detroit Office of Cutler-Hammer Company

The Cutler-Hammer Manufacturing Company, Milwaukee, manufacturer of controlling devices, announces the following changes in its Detroit office:

J. C. Goodale, who has been in the Detroit office of the company for the past three years, has been appointed branch manager. C. W. Greenman of the Detroit office has been transferred to the sales department of the Chicago office, wiring-device department. B. J. Larsen has been transferred from the Chicago to the Detroit office to take up the sales work in connection with wiring devices, heating apparatus and molded products.

## Canadian Allis-Chalmers Awarded $1,500,000 Contract

Contract for the purchase by J. B. Duke, Charlotte, N. C., and Sir William Price, Quebec, Canada, who are developing around 400,000 hp. in hydro-electric plants in Canada, of $1,500,000 of hydraulic machinery has been awarded to the Canadian Allis-Chalmers Company, Quebec. The water-wheel machinery will be utilized in the building of the immense Canadian hydro-electric plants under construction by the Quebec Development Company, Ltd., in which Mr. Duke and Sir William Price are jointly associated.

Other bidders for this contract were the Vickers Company, London; the Armsbury-Whitworth Company, London; the Dominion Engineering Company, Montreal, and the Wellman-Seaver-Morgan Company, York, Pa.

## Parr Opens Newark Branch

The Parr Electric Company, Inc., 77 Warren Street, New York City, announces that in order to give better service to its customers in the State of New Jersey it has opened a branch warehouse and sales office at 28 Treat Place, Newark, where a complete stock is being carried.

## Lindsey Brothers Open Main Sales Office in Minneapolis

The Lindsey Brothers Company has established its Eastern sales office for handling its cedar-pole business at its concentrating yards in Minneapolis. F. D. Scott, who has been the sales manager of the Lindsey Brothers Canadian Company, Ltd., at Nelson, B. C., is in charge of the new office and yards at 3101 University Avenue, N. E., and L. E. Dunn, who has been the traffic manager at the Spokane office, is transferred to the Minneapolis office. The treating plant and Pentrex machine are at Minneapolis, and it is felt that the opening of the new office, which is midway between the Western producing districts and the Eastern consuming districts, will make for better service to customers. It is felt that the location of the main sales office directly at the treating and shipping plant in place of in a downtown office will help to better service to the consumer.

## Dust Explosion Body's Regulations of Interest to Lamp Makers

Manufacturers of electric lamps and other equipment, lamp guards, etc., used in grain elevators, flour and feed mills, sugar-pulverizing plants, pulverizing-fuel plants and cocoa-grinding plants will be interested in new regulations for the prevention of dust explosions which are being prepared by the National Fire Protection Association.

These regulations were finally revised and approved at a meeting of the dust explosion hazards committee held at Buffalo, March 5 and 6, and will be ready for distribution in printed form in a few days through the office of the National Fire Protection Association, 40 Central Street, Boston.

The regulations as printed are tentative only and will be subject to amendment until the next annual meeting of the association, to be held at Chicago, May 8, 9 and 10.

# Jeffery-Dewitt Awarded Large Orders

The Jeffery-Dewitt Insulator Company, Kenova, W. Va., reports an increase in demand for its products to be used in connection with large extensions of transmission lines now being made throughout the country. It states that it has just been awarded one order through its sales representatives, the R. W. Lillie Corporation, 50 Church Street, New York City, by the Southern Power Company, Charlotte, N. C., for 63,200 suspension-type insulators to be used in connection with a hundred-mile transmission-line extension, operating at 110,000 volts. It has also been awarded an order by the William A. Baehr organization of Chicago for 12,250 suspension insulators for shipment to the Oklahoma Light & Power Company.

The company also announces that it is now filling an order for the Niagara, Lockport & Ontario Power Company, Buffalo, for 100,000 suspension insulators to be used in connection with transmission-line extensions operating at 110,000 volts. Other orders for large amounts have been awarded by the United Gas Improvement Company, Philadelphia; the Southern Sierras Power Company, Riverside, Cal., and the Washington Water Power Company, Spokane, Wash.

The fact that this company uses continuous tunnel kilns which operate twenty-four hours per day and 365 days per year insures a large manufacturing production totaling well over half a million suspension insulators per year. Officials state that the demand for the flange-type insulator used in connection with switching apparatus and bus supports has run exceptionally heavy. New orders for flange-type insulators are now running at the rate of 8,000 to 10,000 units per month.

### Anaconda Formally in Control of Chile Copper

Control of the Chile Copper Company formally passed to the Anaconda Copper Mining Company March 7 with the resignation from its board of the following men: W. E. Bennett, A. C. Burrage, Russell Burrage, H. L. Chalifoux, Daniel Guggenheim, Murray Guggenheim, S. R. Guggenheim, E. A. Guggenheim, H. F. Guggenheim, R. C. Klugescheid, J. K. McGowan, E. Earle Moran, John A. Steele and C. A. Wilson.

The following new officers were elected: John D. Ryan, chairman of the board; C. F. Kelley, president; B. B. Thayer, vice-president, and A. H. Melin, scretary and treasurer.

The board of directors of the Chile Copper Company has been reduced to eleven members, the following new board having been elected: John D. Ryan, C. F. Kelley, B. B. Thayer, P. A. Rockefeller, Nicholas F. Brady, Andrew J. Miller, George H. Church and A. H. Melin.

### Dutchess Bleachery Appoints A. P. Eckert Sales Manager

The Dutchess Bleachery, Inc., 320 Broadway, New York City, announces the appointment of Avery P. Eckert as sales manager of its insulation division, with office in New York City. Mr. Avery's experience includes fourteen years with the india-rubber wire division of the United States Rubber Company and thirteen years with the Safety Insulated Wire & Cable Company, 114 Liberty Street, New York City.

### Northern Electric of Canada Opens Hamilton Warehouse

The Northern Electric Company, Ltd., 121 Shearer Street, Montreal, recently opened a warehouse in Hamilton, Ontario, at 43 King William Street, Empire Building, where it is carrying a complete line of electrical supplies, wires and cables, appliances, etc., performing a function similar to its warehouses at London and Windsor, Ont.

### Robertson-Cataract Buys Utica and Syracuse Supply Houses

The Robertson-Cataract Electric Company, Buffalo, announces that it has recently purchased and is operating the Mohawk Electrical Supply Company, Syracuse, N. Y., and the Utica Electrical Supply Company, Utica, N. Y. The company also has purchased property in Rochester, where a branch office and warehouse will be opened April 1.

For many years the Robertson-Cataract Electric Company has covered the entire State of New York (except the metropolitan and southeastern portion) as well as the northern tier of counties in Pennsylvania, and with the acquisition of the concerns enumerated it proposes to give the same service and intensive cultivation throughout the entire territory that has heretofore been given in western New York.

J. B. Wiseman, formerly purchasing agent, has been made supervisor of merchandise in connection with the expansion plans of this company. S. H. Brownlee, formerly investment manager, has been appointed manager of purchase and investment.

### To Represent Pacific Electric

Representation for the Pacific Electric Manufacturing Company has been provided in Denver by J. Ludwig Hansen, an electrical engineer of Salt Lake City, who recently opened offices in the Colorado capital.

### Changes in Varney Supply Staff

The Varney Electrical Supply Company, 121 South Meridian Street, Indianapolis, jobber, announces that H. A. Robertson has been appointed general manager of both its Indianapolis and Evansville (Ind.) houses. He was formerly manager of the Evansville branch. C. S. Walker continues as president of the company and W. H. Makepeace as sales manager of the Indianapolis house. O. L. Ferguson has been made local manager at Evansville and J. H. Richards sales manager at Evansville.

### Killark of St. Louis Appoints California Sales Agent

The Killark Electric Manufacturing Company, Easton and Warne Avenues, St. Louis, manufacturer of fuses, conduit fittings, bell-ringing transformers, soldering paste, etc., announces a new agency arrangement which it has completed recently in San Francisco. The selling agent in this territory is the Electric Sales Company, 111 New Montgomery Street, San Francisco, which will cover northern California.

### Denver Firms Promote Radio

The Hendrie & Bolthoff Company, the Reynolds Radio Corporation, the Winner Radio Corporation, the Rocky Mountain Radio Company and the Mine & Smelter Supply Company, acting through the radio jobbers' association of Denver, have, in the interests of better radio programs, arranged to provide regular afternoon and evening programs from the Reynolds and Winner stations under the direction of Jack O'Brien, a Denver promoter.

### Distributors' Corporation Formed

The Electrical Distributors' Corporation, 47 Center Street, New Britain, Conn., has been incorporated under Connecticut laws to engage in the advertising, distributing and marketing of electrical devices. The capital stock is $200,000, and the officers are: T. H. Lewis, Philadelphia, president; C. F. Smith, New Britain, vice-president; O. F. Rost, Newark, N. J., secretary; V. C. B. Wetmore, Boston, treasurer; P. C. Rickey, Berlin, Conn., assistant treasurer, and E. F. Hall, New Britain, assistant secretary.

### Western Electric Company Breaks Employment Records at Chicago

Records for employment have been broken at the works of the Western Electric Company in Chicago. Increasing at the rate of more than a thousand employees a month since last November, the plant has expanded its force until today it has a payroll of more than 31,000. This rapid growth is a result of the enlarged program of the Bell system.

The growth of the Western Electric works since it opened in 1905 to take over the manufacturing functions formerly carried on at the shops in New York and on Clinton Street, Chicago, has constantly reflected expansion of the country's telephone system. From a working force of 9,974 men and women in 1905 the plant personnel increased to 13,596 in 1910, 16,735 in 1918, 20,125 in 1920 and an average of 26,625 in 1922, until it reached its present high mark for more than 31,000.

The present working force at the Chicago works consists of 21,300 men and 8,700 women. Of this number 7,360 have been employed by the Western Electric Company more than five years each.

**The Main Electric Company**, Cleveland, manufacturer of power and light plants, announces that it has acquired the Radio Company, whose products will be continued as heretofore. The Main company has resumed shipping lighting plants to South America with the improvement in exchange rates and general business conditions.

**The Robert Findlay Manufacturing Company**, 100-104 Lexington Avenue, Brooklyn, N. Y., manufacturer of lighting fixtures, has plans nearing completion for the erection of a three-story plant addition, 60 ft. x 100 ft., estimated to cost $25,000. It is expected to call for bids and award a contract at an early date.

**The Interstate Electric Company**, St. Louis, Mo., recently organized with a capital of $20,000, has arranged for the operation of a local plant for the manufacture of battery-charging outfits for radio and other batteries and kindred electric equipment. The initial capacity will be about fifty charging outfits daily.

**The International Lamp Corporation**, Chicago, has been organized with a capital of $2,000,000 to take over and merge the International Lamp Manufacturing Company, 5338 Wabash Avenue, Chicago; the Superior Furniture Manufacturing Company, the Standard Lamp Manufacturing Company and the Garden City Manufacturing Company. Nathan Manilow, head of the first-named company, is president of the consolidated organization.

**The Pure Carbon Company**, Wellsville, N. Y., manufacturer of carbon brushes for motors and generators, also carbon specialties, announces the establishment at Clarksburg of a northern West Virginia representative, Norman Strugnell.

## Foreign Trade Notes

ELECTRIFICATION OF THE SWISS FEDERAL RAILWAYS TO BE RUSHED. —The Director-General of the Swiss Federal Railways, in a speech recently delivered before the members of the Swiss press regarding the accelerated electrification of the Federal Railways, stated that of the total amount appropriated for that purpose 25 per cent, or about 112,500,000 francs, will be expended abroad for the purchase of material. It is now proposed to rush the work on the electrification of 1,117 km. so that all the lines will be completed at the end of 1928. According to the new program, about 190 km. will be electrified each year, instead of 110 km. Energy to operate the above lines will be secured from the Barberine power station, now under construction, and the upper station at Chatelard. The cost of these stations is estimated at 42,000,000 francs and is included in the amount appropriated for the electrification work.

SPAIN DECREES RADIO A MONOPOLY. — The Spanish government has declared radio telephony, according to *Commerce Reports*, a state monopoly, and a decree to this effect was published March 1. Bids for an exclusive concession to exploit radio telephony in Spain will be asked within sixty days. Foreign companies interested will be given an opportunity for submitting proposals. It is stated, however, that Spaniards will have the preference in the matter.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase and agency is desired in Bolivia (No. 5,627) of electrical goods, sanitary supplies, etc.

An agency is desired in Austria (No. 5,669) for automobile accessories, such as lighting systems, electric starters and furnishings for bodies.

An agency and purchase is desired in France (No. 5,684) for an electric dishwashing machine for household and hotel use.

Purchase or agency is desired in Italy (No. 5,685) for small electric furnaces for gold and silversmiths and like trades.

Purchase is desired in Spain (No. 5,691) for three electric cranes to lift up to 6,614 lb. with a radius of 14 m., with arms 16 m., on track of 5 m. width inside rails, and four electric motors, three-phase, 50 cycles, 11,750 volts, alternating current, to be transformed on the motors provided.

ADDITIONAL POWER FOR THE RAND MINES, SOUTH AFRICA. — The directors of the Victoria Falls & Transvaal Power Company, Ltd., which, with its subsidiary, the Rand Mines Supply Company, Ltd., supplies most of the Rand mines and municipalities with power, according to *Commerce Reports*, contemplate extensions to its plant, including the installation of two large generating units with boilers and accessories, which will be purchased in the near future. The municipality of Johannesburg is considering making arrangements with the company whereby the former will connect its light and power system with the municipal system of the town of Johannesburg.

TURBO-GENERATORS FOR WHITE BAY POWER HOUSE, SYDNEY, AUSTRALIA.—Tenders will be received by the Railway Commissioners until June 13 for two 20,000-kw. turbo-alternators with condensing plant and accessories for the White Bay power house, Sydney, of the New South Wales Government Railways and Tramways.

WATER-SCREENING PLANT FOR THE MORWELL POWER SCHEME, AUSTRALIA.—Tenders are being asked (no date) by the State Electricity Commission of Victoria, Melbourne, Australia, for a water-screening plant for the Morwell power scheme (Specification 23-28).

CAMA, NORTON & COMPANY, 11 Elphinstone Circle, Bombay, India, importers of electrical machinery, plants, devices and appliances, would like to receive catalogs and other literature relating to electrical machinery, equipment and appliances, and would also like to correspond with manufacturers and dealers of same.

POSSIBLE MARKET FOR ELECTRIC TRUCKS IN MARSEILLES, FRANCE.—Owing to the scattered location of many large factories and shipping firms around Marseilles, France, there is a considerable demand for trucks. Gasoline trucks have been used heretofore, but an enterprising firm, *Commerce Reports* states, desires to introduce electric trucks on account of their greater economy of operation. Further information may be secured on application to the Automotive Division, Bureau of Foreign and Domestic Commerce, Washington, D. C.

## New Apparatus and Publications

ELECTRIC INCUBATOR AND BREEDER. — The Oakes Manufacturing Company, Tipton, Ind., has placed on the market an all-metal electric incubator.

ELECTRIC SOLDERING IRON. — The Post Electric Company, 30 East Forty-second Street, New York City, has developed a new small electric soldering iron.

TRAFFIC LAMPS. — The Safety Traffic Light Manufacturing Company, 425 East Water Street, Milwaukee, has brought out a new line of disappearing-dome safety traffic lamps.

ELECTRIC RANGES.—Three new models of electric ranges, known as "Hotpoint Hughes" apartment-house ranges, have been developed by the Edison Electric Appliance Company, Inc., 5,600 West Taylor Street, Chicago.

ATTACHMENT FOR BATTERY CHARGE.—A device for charging "B" batteries, to be used as an attachment to the "Tungar" battery charger, has been developed by the General Electric Company, Schenectady, N. Y.

COIN-OPERATED ELECTRIC FAN.—The electric Fan Sales Company, Memphis, Tenn., has placed on the market an electric fan that will run one hour for each nickel deposited in the slot.

WAFFLE IRON.—The Fitzgerald Manufacturing Company, Torrington, Conn., has recently brought out a new "Star-Rite" waffle iron.

COMBINATION TESTER.—A combination tester, "Jefferson," for spark plugs and automobile lamps has been developed by the Jefferson Electric Manufacturing Company, 426 South Green Street, Chicago.

CEILING FAN.—An alternating-current ceiling fan with a "Brascolite" lamp attachment has been brought out by the Hunter Fan & Motor Company, 46 West Forty-eighth Street, New York City.

METER BOX. — A complete meter box installed so that it may be read outside the building is being offered by the Donley Brothers Company, 7,400 Ætna Road, Cleveland.

ELECTRIC WATER HEATER.—An electric water heater that can be attached to any water boiler has been developed by the Acme Electric Heating Company, 1,217 Washington Street, Boston.

SURGE ARRESTERS.—Bulletin No. 4-A distributed by the Electro Service Company, Marietta, Ga., describes the "Bennett" surge arresters and disk gaps.

## New Incorporations

THE MILFORD TOWNSHIP POWER COMPANY, Philadelphia, has been chartered to install and operate an electric system in Milford Township. R. Van Horn, 4,929 Catherine Street, Philadelphia, is treasurer.

THE CLARKE COUNTY POWER & WATER COMPANY, Vancouver, Wash., has been incorporated with a capital stock of $50,000 by C. W. Riddell, R. S. Durkee, A. L. Miller, George Nowak and H. H. Riddell. The company proposes to erect a transmission line to Battle Ground and vicinity.

THE CORAL GABLES UTILITIES COMPANY, Miami, Fla., has been chartered with a capital stock of $500,000. The officers are: George E. Merrick, president, and Edwin G. Bishop, secretary and treasurer.

THE LANIER COUNTY POWER COMPANY, Milltown, Ga., has been incorporated by F. E. Hatch, Albany; R. T. Berryhill, Milltown, and others. The company is capitalized at $300,000 and proposes to construct a hydro-electric plant on Lake Irma, for which contract has been awarded.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

LEWISTOWN, ME. — Electric power equipment will be installed in the proposed addition to the textile mill of the Hill Manufacturing Company, to cost $175,000.

MANCHESTER, N. H.—The directors of the Manchester Traction, Light & Power Company have authorized an increase in capital stock of $708,300, the proceeds to be used to pay for the addition to the Kelley's Falls plant and for laying wires in underground conduits which have already been built.

BEVERLY, MASS.—Plans for the proposed high school to be erected at Sohier Road and Conlon Street, to cost about $1,000,000, include a power plant. Adden & Parker, 177 State Street, Boston, are architects.

FALL RIVER, MASS.—Plans are under way for a new power development at Fall River to supply power in Fall River, Pawtucket and Brockton. A new company will be formed, known as the Montaup Electric Company, to operate the plant. The cost of the proposed plant is estimated at $11,000,000. Interests connected with the Fall River Electric Light Company, the Edison Electric Illuminating Company of Brockton and the Blackstone Valley Gas & Electric Company are said to be behind the project.

WORCESTER, MASS.—Improvements are contemplated by the Worcester Electric Light Company, including the installation of a 12,500-kw. turbo-generator. The cost is estimated at about $500,000.

WOONSOCKET, R. I.—Work has begun on the construction of a new power plant for the Guerin Mills, Inc., to cost about $80,000.

GEORGETOWN, CONN.—The Gilbert & Bennett Company will install electric power equipment in its proposed three-story mill addition, 50 ft. x 135 ft., for the manufacture of wire cloth.

MIDDLETOWN, CONN.—The construction of a new power house on Water Street is under consideration by the Connecticut Power Company, as are improvements to the power house in the Cromwell district. The company also plans to lay a 13,000-volt cable from Middletown to Portland.

SOUTH COVENTRY, CONN.—The Willimantic Paper Company will install a waterwheel and electric power equipment at its local mills.

## Middle Atlantic States

BUFFALO, N. Y.—Electric power equipment will be installed in the new printing plant to be erected by the J. W. Clement Company, Lord Street, at a cost of about $150,000.

BUFFALO, N. Y.—Plans for the proposed plant of the Hendon Chemical Company, recently organized, include a power house. The cost is estimated at about $1,000,000. Williams, Minard & Williams, Erie County Bank Building, are representatives.

BUFFALO, N. Y.—The New York Telephone Company has awarded a contract to the John W. Cowper Company, Fidelity Building, for the construction of a three-story mechanical plant at East Delavan and Jefferson Avenues, to cost $250,000. A machine shop with motor-driven equipment will be installed.

TRENTON, N. J.—The board of directors of the Mercer Hospital are considering the construction of a power house, to cost about $30,000.

DANVILLE, PA.—The installation of a street-lighting system on Mill Street is under consideration.

HAZLETON, PA.—The Wilkes-Barre & Hazleton Railway Company will install additional transformers and other equipment at its power plant. Connection will be made with the lines of the Pennsylvania Power & Light Company.

MARTIN'S CREEK, PA. — The Atlas Portland Cement Company, 25 Broadway, New York, is planning to install a 6,250-kw.

turbo-generator and auxiliary equipment in the power house of its local cement-mill. Extensions and improvements will also be made at other power plants of the company.

NORRISTOWN, PA.—The power plant of the Montgomery Ice & Coal Company was recently damaged by fire, causing a loss of about $55,000.

PHILADELPHIA, PA. — The Milford Township Power Company, recently organized, plans to erect a transmission line in Milford Township. R. Van Horn, 4920 Catherine Street, Philadelphia, is treasurer.

PHILADELPHIA, PA. — Electric power equipment will be installed in the printing plant to be erected by the Philadelphia *Inquirer* at Broad and Callowhill Streets, to cost about $500,000.

PHILADELPHIA, PA.—The Philadelphia Electric Company has acquired property, 100 ft. x 100 ft., adjoining its power plant on Sansom Street, for proposed future additions.

PITTSBURGH, PA. — The Philadelphia Company has issued $10,000,000 in bonds, the proceeds to be used for extensions and improvements, including an addition to its steam-generating plant on Duquesne Way to increase the output by 5,500 hp.

PITTSBURGH, PA.—The Duquesne Light Company is arranging a construction program for extensions and improvements at its Colfax power plant and transmission lines, including the erection of a number of substations, to cost about $10,000,000.

POTTSVILLE, PA.—The East Penn Electric Company has issued $2,500,000 in bonds, the proceeds to be used for the construction of a 33,000-hp. steam-driven electric power plant, on which preliminary work has been commenced.

WILKES-BARRE, PA. — A contract for street lighting has been awarded to the Wilkes-Barre company. All gas lamps will be replaced with electric lamps.

BALTIMORE, MD.—Tentative plans are under consideration by the United Railways & Electric Company for extensions and improvements during 1923, involving an expenditure of $2,120,000.

NEWELL, W. VA.—Electric power equipment will be installed in the proposed addition to the plant of the Homer Laughlin China Company, to cost about $700,000.

WASHINGTON, D. C.—Bids will be received by the Chief of Air Service, United States Army, until March 20 for 10,000 ft. of high-tension ignition cable, No. 26, B. & S. gage. (Circular 590.)

WASHINGTON, D. C.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, until March 27 for a quantity of inclosed fuses for Eastern and Western yards. (Schedule 595.)

WASHINGTON, D. C.—Bids will be received by the Chief Signal Officer, United States Army, until March 20 for insulators (Circular PR 13938-A-1CP); until March 19 for switchboard supplies (Circular PR 13932-1 CP); until March 22 for air condensers (Circular PR 13936-A-5CP): until March 26 for ten 200-ft. tubular-steel radio masts and one mast-erecting equipment complete (Circular PR 13938-A-22CP).

## North Central States

IONIA, MICH.—The Ypsilanti Reed Furniture Company will install electric power equipment for its proposed addition, to cost about $150,000.

ALLIANCE, OHIO.—The installation of a new ornamental lighting system is under consideration by the City Council.

TIFFIN, OHIO.—The County Commissioners have decided to install an electric lighting system in the buildings at the Seneca County Infirmary.

CARTER, KY.—The Ashland Limestone Company plans to build a power house at its local plant. M. E. S. Posey, Ashland, is manager and engineer.

LOUISVILLE, KY. — The City Council has applied to the Federal Power Commission for permission to construct two municipal hydro-electric plants, one on Green River near Mammoth Cave, and one the Cumberland River, near Burnside.

SEYMOUR, IND.—The Automatic Control Company, 707 Odd Fellows' Building, Indianapolis, contemplates building a plant in Seymour, including a power house, estimated to cost about $1,000,000. The Russell N. Edwards Company, 45 Union Trust Building, Indianapolis, is architect.

BELLEVILLE, ILL. — The Southern Illinois Light & Power Company, Hillsboro, contemplates the erection of a high-tension transmission line from Belleville to Edgemont, a distance of 10 miles.

CHICAGO, ILL. — The Illinois Central Railroad Company, 135 East Eleventh Place, is preparing plans for the electrification of its Wildwood yard, south of Kensington, and of the Markham yard, to cost about $1,000,000.

AMERY, WIS.—The Wisconsin Hydro-Electric Company contemplates extending its transmission lines to the village of Prairie Farm.

LADYSMITH, WIS.—The City Council has authorized the obtaining of estimates of cost for the installation of a municipal lighting plant to serve the city buildings and the ornamental street-lighting system.

MARSHFIELD, WIS.—The City Council has authorized the Light and Water Commission to advertise for bids for the installation of a new generating unit for the municipal electric light and power plant.

PHILLIPS, WIS.—The property of the Phillips Light, Heat, Water & Power Company has been acquired by the Flambeau Public Service Company, which will furnish electricity to operate the local service from its plant at Parks Falls. The Flambeau company, it is understood, will rebuild the entire local distribution system in the near future.

PLYMOUTH, WIS.—The committee appointed to investigate the question of purchasing electricity instead of generating it at the municipal electric plant has recommended to the City Council that the city accept the proposal of the Eastern Wisconsin Electric Company, Sheboygan, to supply electricity for the city. The company offers to erect a transmission line from its substation to the municipal plant.

PLYMOUTH, WIS. — Preliminary arrangements, it is reported, are being made by the Badger Public Service Company, Elkhart Lake, for the erection of a 132,000-volt transmission line from the electric generating plant of the Milwaukee Electric Railway & Light Company at Lakeside to Plymouth. The Badger company is now building a transmission line from Kewaskum to Cedar Grove.

ANNAPOLIS, MO.—Plans are being prepared for the construction of an 800-ft. power dam, 100 ft. high, to develop from 2,000 hp. to 5,000 hp., to cost about $1,000,000. The proposed dam will furnish power to the mines of the Annapolis Lead Company near here. C. T. Dana, International Life Building, St. Louis, is interested in the project. W. A. Fuller, Railway Exchange Building, St. Louis, is engineer.

HOLLISTER, MO. — Preliminary plans have been prepared by the Empire District Electric Company, Joplin, for a 1,500-ft. power dam, 175 ft. high, on White River, about 3½ miles from Hollister, to cost about $15,000,000. A large power plant, it is said, will be erected here at a later date. G. A. Montgomery, Joplin, is manager.

ST. LOUIS, MO.—Bids, it is understood, will soon be asked by the St. Louis & San Francisco Railroad Company, St. Louis, for repair shops, round shop, power house, mill shop, etc., at Fyler Avenue and railroad right-of-way, to cost about $500,000. R. C. Stephens is architect.

SEDALIA, MO.—The City Light & Traction Company plans to install soon equipment at its power plant, now under construction at Broadway and Ingram Avenue. It will have a capacity of 8,000 kw. and will cost about $350,000.

SENECA, MO.—H. G. Olmstead & Company, Oklahoma Building, Oklahoma City, engineers, have been engaged to prepare plans for a transmission line and local distributing system.

CLEARWATER, NEB.—Plans are being prepared for extensions and improvements in the municipal electric light plant.

RANDOLPH, NEB.—The installation of a Diesel engine and other equipment at the municipal power plant is under consideration.

KANORADO, KAN.—Bids will be received by the Council until March 27 for the erection of a transmission line, to cost about $25,000. W. B. Rollins, Railway Exchange Building, Kansas City, Mo., are engineers.

PARSONS, KAN.—The Kansas City Gas & Electric Company will build a steel-tower transmission line from Parsons to Wichita. Work will soon begin on its new local generating plant. The entire project will cost about $3,500,000.

WICHITA, KAN.—The American Power & Light Company has issued $5,000,000 in bonds, part of the proceeds to be used for extensions and improvements.

WICHITA, KAN.—L. R. Hurd, president of the Red Star Milling Company, and associates are planning to build a power plant to furnish electricity to two units of the Red Star Milling Company's mills, at 1901 Worth Emporia Avenue. Contracts have been placed for part of the equipment.

## Southern States

CHINA GROVE, N. C.—The Swink Manufacturing Company contemplates erecting a large cotton mill and the development of a new town, to be named Swink. The town site will be on the Southern Railway, 6 miles south of Salisbury, and includes a development of 400 acres, power and sewer systems, to cost about $2,000,000. W. J. Swink, China Grove, is president.

FAISON, N. C.—Bonds for $15,000 have been sold, the proceeds to be used for a municipal lighting plant.

HENDERSON, N. C.—The Blue Ridge Power Company contemplates a new hydro-electric development on the Green River, to develop about 8,000 hp., at a cost of about $1,000,000.

WADESBORO, N. C.—The Wade Manufacturing Company is planning to build a hydro-electric generating plant for service at its cotton mills. The Yadin River Power Company is interested in the project. Robert & Company, Atlanta, Ga., are engineers.

BLACKSHEAR, GA. — Negotiations are under way between the Council and the officials of the Ware County Light & Power Company, Waycross, to furnish electricity to operate the local system. It is proposed to establish a twenty-four-hour service.

JACKSONVILLE, FLA.—Plans are being prepared for the construction of a substation on Enterprise Street, to cost about $55,000.

JACKSONVILLE, PA.—Bids will be received by the City Commission of the city of Jacksonville until March 19 for equipment for the municipal electric plant, including one 12,000-kw. turbo-generator, surface condensing equipment, switchboard additions and improvements, for generating and substations, constant-current transformers, power transformers, synchronous motors, two storage batteries, lead-covered cable and jointing material and copper wire. W. A. Evans is chairman. The Scofield Engineering Company, Philadelphia, is consulting engineer.

TALLAHASSEE, FLA.—The West Florida Power Company plans to erect a transmission line from Quincy to Havana, Fla. Work will soon begin on a hydro-electric power plant on the Ocklocknee River, 9 miles from Tallahassee, to cost about $500,000. Mees & Mees, Charlotte, N. C., are engineers.

TAMPA, FLA. — The Tampa Electric Company contemplates extensions and improvements, to cost about $300,000.

WAUCHULA, FLA. — Electrically operated pumping machinery and power equipment will be installed at the municipal waterworks.

CHATTANOOGA, TENN. — Extensions and improvements are contemplated by the Tennessee Electric Power Company during 1923, involving an expenditure of about $1,000,000, of which about $400,000 will be spent in the Chattanooga district, $100,000 being for the street-railway improvements. The balance will be used for substations, street-lighting purposes, transmission and distribution, lines, etc.

BIRMINGHAM, ALA.—Plans are being prepared by the St. Louis & San Francisco Railroad Company, St. Louis, for round-house, car repair shop, power house, machine shop, etc., to cost about $500,000, at East Thomas. Bids, it is understood, will soon be asked for the work.

HEFLIN, ALA.—The electric plant of the Heflin Telephone & Electric Company was recently destroyed by fire. At present the town is without electrical service.

NEWTON, ALA. — The Houston Power Company will soon take bids for equipment for the proposed 3,000-hp. addition to its local hydro-electric plant. The Southern Engineering Corporation, Albany, Ga., is engineer.

JACKSON, MISS.—The property of the Jackson Public Service Company, including the street-railway, electric and gas systems, has been purchased by H. C. Couch and J. L. Longino of Pine Bluff, Ark., and associates. Improvements to the systems, it is said, are contemplated.

BAUXITE, ARK.—The Arkansas Light & Power Company will build a transmission line for service in the city and for the plant of the American Bauxite Company.

SWIFTON, ARK. — Surveys have been made for the installation of an electric light plant in Swifton. A. T. White is reported to be interested in the project.

BATON ROUGE, LA.—The City Council is having plans prepared for complete new waterworks and sewerage systems, light and power plant, street improvements, etc., to cost about $1,000,000. J. W. Billingsley, Interstate Bank Building, New Orleans, is consulting engineer.

JEFFERSON, OKLA.—Plans are under way for the erection of a transmission line and extensions to the local distribution system, to cost about $10,000. J. D. Bomford, Masonic Temple, Enid, is engineer.

PICHER, OKLA. — The Mogul Mining Company plans to rebuild its plant and power house, recently destroyed by fire, causing a loss of about $90,000.

ELDORADO, TEX.—The Arkansas Light & Power Company is preparing plans for an ice-manufacturing and refrigerating plant, to cost about $100,000.

GRANBURY, TEX.—A special election will be held on March 20 to vote on the proposal to issue $75,000 in bonds for the installation of a municipal electric light and water plant.

## Pacific and Mountain States

BELLINGHAM, WASH. — The Puget Sound Power & Light Company and the Pacific Northwest Traction Company (affiliated) contemplate extensions in power systems in Whatcom and Skagit Counties to cost $400,000.

RAYMOND, WASH.—Arrangements have been made by the Willapa Lumber Company for the installation of a 1,500-kw. turbine, to cost from $75,000 to $100,000. The company proposes to electrify its entire plant.

SEATTLE, WASH.—The Banner Refining Company, Kohl Building, San Francisco, contemplates the construction of a power house at its proposed local refinery, to cost about $200,000.

YAKIMA, WASH.—The Artificial Ice & Cold Storage Company will install electric power equipment at its proposed ice-manufacturing and cold-storage plant, to cost about $100,000.

BERKELEY, CAL.—Plans are being prepared for an ornamental lighting system on Telegraph Avenue from the south city limits to Allston Way. About seventy-five standards will be required.

EL CENTRO, CAL.—The City Council has authorized Harry Ott, superintendent of the city department, to secure estimates of the cost of an electric plant of sufficient capacity to operate the pumping plant and to furnish electricity for street lighting.

FULLERTON, CAL.—The County Brick & Tile Company, recently organized, contemplates the installation of a substation in connection with its proposed local plant, to cost $50,000. F. C. Krause is interested in the company.

LOS ANGELES, CAL.—The Public Service Commission has rejected bids recently received for ammeters, and new bids will be called.

PORTOLA, CAL.—The electric plant of the Grizzly Electric Company was recently destroyed by fire, causing a loss of about $5,000. R. B. Young is owner.

SACRAMENTO, CAL.—Tentative plans are under consideration for the installation of an ornamental lighting system on Twelfth Street, from the Capitol grounds to the subway.

SAN MATEO, CAL. — Plans are being drawn for the installation of an ornamental lighting system in the business district, for which bids will soon be asked. G. Stanley Whitehead is engineer.

SAN MATEO, CAL.—The Pacific Gas & Electric Company will build a steel-tower double transmission line in San Mateo County, in the vicinity of Redwood City and Visitacion Valley (24 miles), to cost about $915,000.

SANTA MONICA, CAL.—Plans are being prepared for the installation of a street-lighting system on Pier Avenue.

SAN RAFAEL, CAL.—The Pacific Gas & Electric Company, San Francisco, contemplates the installation of a new generator and accessories and the erection of 8 miles of transmission line.

VENICE, CAL.—The proposal to issue $100,000 in bonds for the installation of an electric distributing system was defeated at a recent election.

EPHRAIM, UTAH.—Plans are being considered for extensions to the municipal electric light plant.

LOGAN, UTAH.—An election will be held April 2 to vote on the proposal to issue $200,000 in bonds for enlarging the municipal electric light plant.

ALAMOSA, COL.—Arrangements have been made by the local officials of the Colorado Power Company to provide electrical service in the towns of Antonito and Manassa, which heretofore have been served by local plants. The cost of rebuilding the systems in the two towns is estimated at about $12,000. The cost of extending the service to those communities is placed at $30,000. A private line from Alamosa to La Jara will be leased and a new line (22,000-volt) erected from that point into Antonito. A substation will be built at Romeo.

DENVER, COL.—In addition to several ornamental street-lighting projects planned for the spring, new lamps at street intersections in the residence section of the city have been authorized by the City Council. About 150 lamps will be installed, consisting of arc lamps, 400-cp. incandescents and 80-cp. bracket lamps.

RENO, NEV.—The Truckee River Power Company is preparing plans for extensions in its transmission lines (48 miles) for connection with the system of the Pacific Gas & Electric Company near Lake Spaulding, to be operated at 60,000 volts. The cost is estimated at about $300,000.

## Canada

BLENHEIM, ONT. — The Councils of Erieau, Cedar Springs and Erie Beach are having plans prepared for the installation of electric lighting systems in each town, electricity to be supplied from Blenheim. Frederick A. Gaby, chief engineer of the Hydro-Electric Power Commission of Ontario, will have charge of the work.

DURHAM, ONT. — The Hydro-Electric Power Commission of Ontario is planning to extend its transmission lines through Grey County, with Durham as the central point. F. A. Gaby, Toronto, is chief engineer.

HAMILTON, ONT.—The Hamilton Hydro-Electric Commission contemplates the erection of a new substation, to cost about $100,000.

LONDON, ONT. — The Public Utilities Commission is planning extensions to the ornamental lighting system, to cost about $30,000.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued Feb. 27, 1923)

1,446,523. Insulator; L. Steinberger, Brooklyn, N. Y. App. filed Feb. 14, 1919. Means for securing hollow strain members to strain or suspension insulators.

1,446,544. Electrical Sound-Detecting Apparatus; P. W. Bridgman, Cambridge, Mass. App. filed June 25, 1919. Microphone of double-cell type.

1,446,546. Method and Apparatus for the Fixation of Nitrogen; C. H. Buettner, Cincinnati, Ohio. App. filed Feb. 3, 1922. By annular electric arcs.

1,446,552. Weighing Scale; H. F. Dunn, Anderson, Ind. App. filed May 10, 1916. Electrically actuated indicating means for weighing scales.

1,446,582. Call-Distributing System; L. Polinkowsky, Antwerp, Belgium. App. filed June 20, 1922. Uniformly distributing calls received over a number of operators' positions.

1,446,593. Stress-Distributed Insulator; S. S. Sonneborn, Brooklyn, N. Y. App. filed April 24, 1918. High-tension guy-wire type that is subjected to considerable mechanical stress.

1,446,598. Terminal; T. W. Turner, Minneapolis, Minn. App. filed May 24, 1921. For aërial cable telephone wires.

1,446,622. Cut-Out Box; W. C. Hollins and F. P. Arrousez, Los Angeles, Cal. App. filed Aug. 27, 1919. Fireproof cut-out box.

1,446,642. Motor Controller; E. I. Deutsch, Milwaukee, Wis. App. filed April 2, 1920. Automatically interrupts braking connection of alternating-current motors upon stopping of motor.

1,446,650. Electrical Condenser; B. MacPherson, Roxbury, Mass. App. filed Oct. 22, 1919. For radio service.

1,446,653. Electric Curling Iron; M. Murphy, Indianapolis, Ind. App. filed March 30, 1922.

1,446,695. Electric Lamp Stand; H. Dunn, San Francisco, Cal. App. filed Jan. 12, 1921. Table light with switch button on top of shade.

1,446,703. Electric Heater; F. Hnilo, Cicero, Ill. App. filed April 9, 1921. Room heater of reflector type.

1,446,720. Process of Treating Electrical Resistances to Stabilize Their Resistance; F. R. Parker, Chicago, Ill. App. filed Jan. 8, 1920.

1,446,736. Manufacture of Hydrogen and Oxygen; F. G. Clark, Toronto, Ont., Can. App. filed Aug. 29, 1919. By electrolytic decomposition of water.

1,446,738. Fire-Alarm Signal Booth; J. Dziedzie, Detroit, Mich. App. filed May 1, 1920. Alarm system installed in booth that automatically locks when alarm is given.

1,446,748. Electroscopic Apparatus; F. A. Johnsem and K. Rahbek, Copenhagen, Denmark. App. filed July 16, 1919. For indicating charge of electricity in a body.

1,446,752. Generator and the Generation of Multiple Frequencies; B. W. Kendall, New York, N. Y. App. filed Dec. 29, 1916. Production of carrier waves for multiplex signaling.

1,446,757. Electrical Rectifier; O. K. Luscomb, Allston, Mass. App. filed May 19,1919. Vibrating type.

1,446,769. Aperiodic Pilot Condctor; M. I. Lupin, Norfolk, Conn. App. filed Jan. 10, 1920. For telephone systems.

1,446,770. Magnetic Interlocking Repeater; C. J. Rogers, Morris, Okla. App. filed Sept. 27, 1919. For telegraphic work.

1,446,780. Electric Flashing Device; V. W. Balzer and J. McK. Ballou, Los Angeles, Cal. App. filed Sept. 14, 1920. Sign advertising equipment.

1,446,787. Turbo-Generator Set; C. W. Dake, Chicago, Ill. App. filed Aug. 20, 1919. Small set such as is used for lighting locomotives.

1,446,798. Electric Flatiron; W. T. Hoofnagle, Glen Ridge, N. J. App. filed June 1, 1921. Fusable plug opens circuit within iron at predetermined temperature.

1,446,807. Electric Heater for Liquids; J. F. Mercer, Globe, Ariz. App. filed Nov. 29, 1921. Heating element placed between successive compartments.

1,446,821. Service Entrance Cap; C. H. Bissell, Syracuse, N. Y. App. filed Aug. 29, 1916. For electrical conduits.

1,446.861. Dynamo-Electric Machine; J. Slepian, Wilkinsburg, Pa. App. filed May 23, 1919. Means for annulling counter-rotational currents.

1,446,880. Thermostat and Control System; O. A. Colby, Irwin, Pa. App. filed Jan. 23, 1920. Helical bimetallic element heated in accordance with temperature of heat-storage device.

1,446,882. Method of Repairing Storage Batteries; C. W. Cox, Ames, Iowa. App. filed July 28, 1919. Method of steaming battery cells, drilling top connectors, withdrawing elements, washing and reassembling.

1,446,890. Radio Receiving Apparatus; L. Espenschied, Hollis, N. Y. App. filed June 7, 1918. Complicated connections of inductances and condensers to eliminate static.

1,446,898. Stator Structure for Dynamo-Electric Machines; M. E. Gysel, Wilkinsburg, Pa. App. filed Dec. 13, 1917. Laminated core and method of fastening in place.

1,446,909. Automobile Signal Light; H. F. Kuechler, Kenosha, Wis. App. filed March 14, 1922. Rear-end direction signal.

1,446,971. Electrical Controlling System; J. H. Hunt, Dayton, Ohio. App. filed May 21, 1921. Electrically controlling machine-gun firing through airplane propeller.

1,446,991. Heating Pad; W. Richmond, Chicago, Ill. App. filed Feb. 5, 1920. Electric therapeutic apparatus for treatment of mastoid and sinus trouble.

1,446,995. Temperature Compensating Appliance; H. S. Sines, Chicago, Ill. App. filed Nov. 7, 1921. Compensates for varying resistance of ammeter shunt caused by temperature.

1,447,026. Automatic Liquid Starter for Alternating and Three-Phase Current Motors; J. Lewin, Berlin-Halensee, Germany. App. filed June 5, 1922. Short-circuiting bars and liquid within motor rotor.

1,447,031. Electrically Heated Warming Pad; G. T. Newell, Jr., Beverly, N. J. App. filed Jan. 30, 1920. Three different degrees of heat with thermostatic control.

1,447,043. Electric Heater; J. H. Ross, Toronto, Ont., Can. App. filed Aug. 5, 1921. Heated for air-drying machines.

1,447,044. Heating Device; H. E. Roys, New York, N. Y. App. filed April 9, 1920. Grill plate.

1,447,046. Resiliently Mounted Armature; T. S. Scott, Pittsburgh, Pa. App. filed Feb. 15, 1919. Spring carriage for single-phase railway motors.

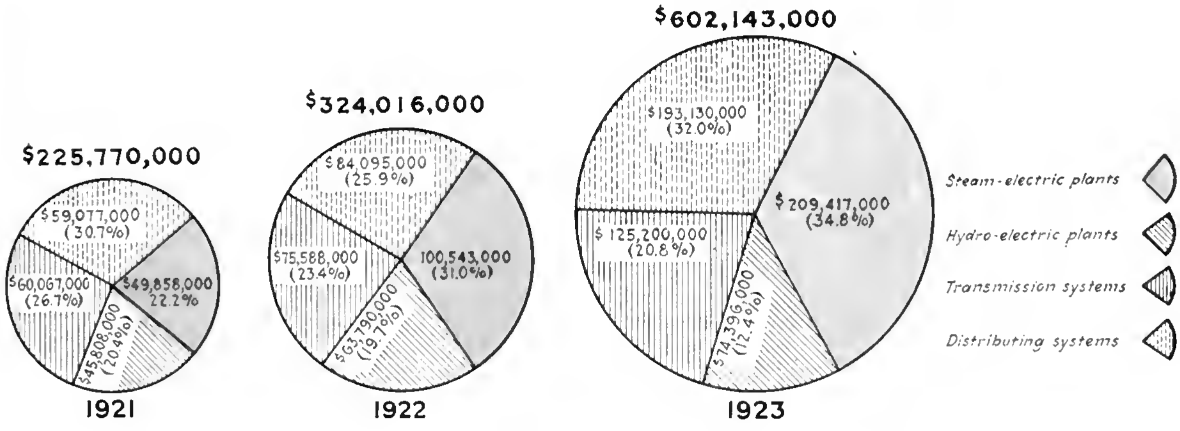
1,447,050. Anti-Rolling Handlamp; F. G. Stimson, Hamden, Conn. App. filed May 20, 1922. Octagonal head.

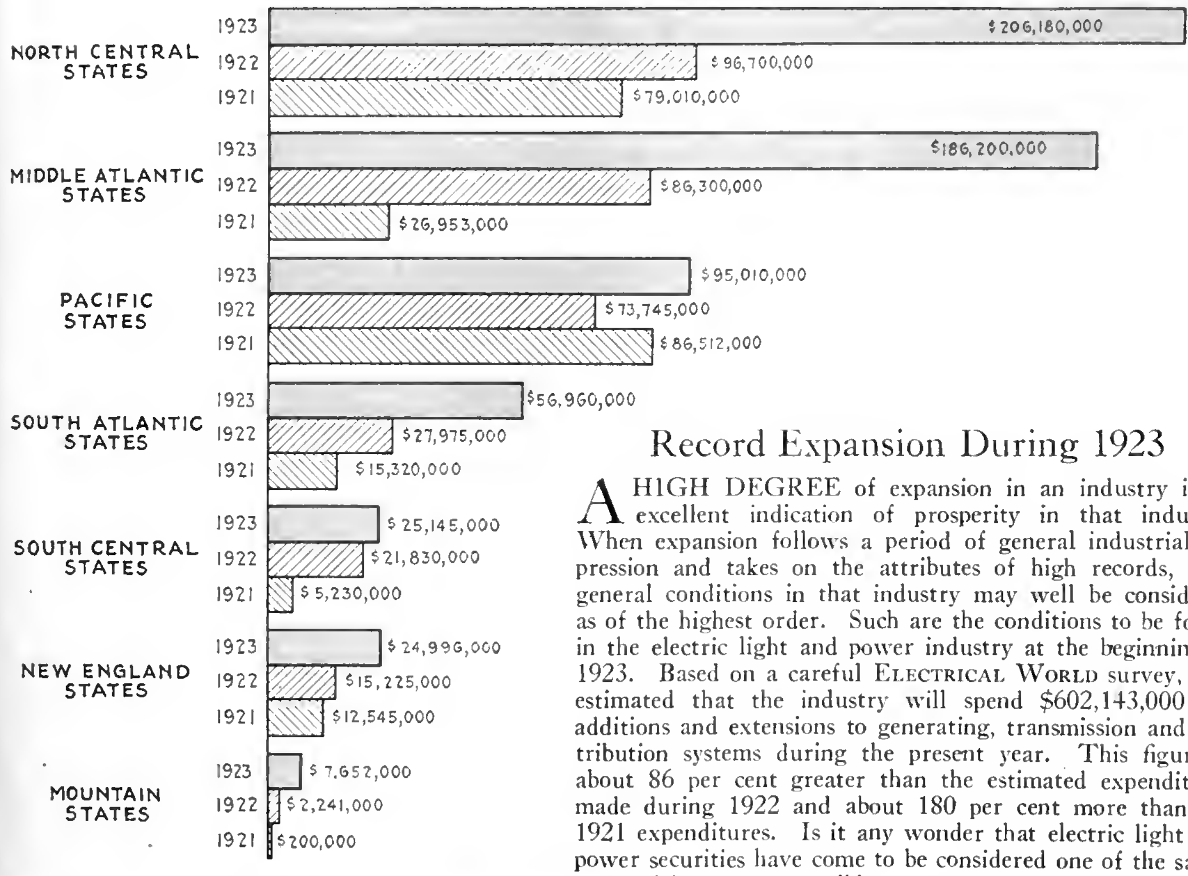
# Business Facts for Electrical Men

Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business

## Estimated Value of Central Station Additions and Extensions During 1923 Almost Double that of 1922

*The North Central States Lead in Proposed Expenditures During 1923*

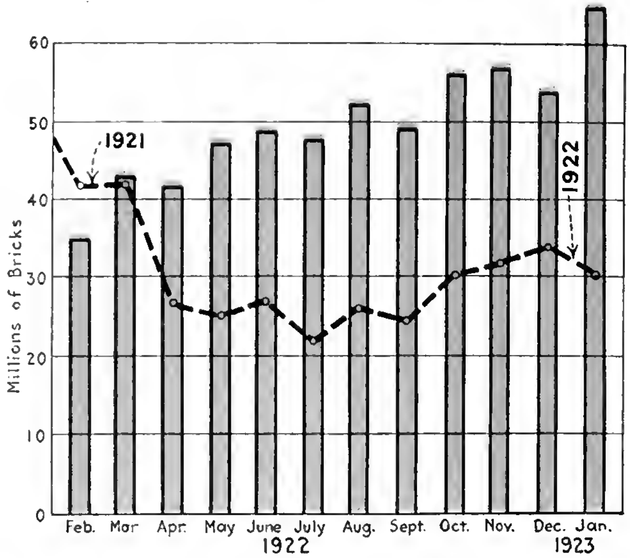




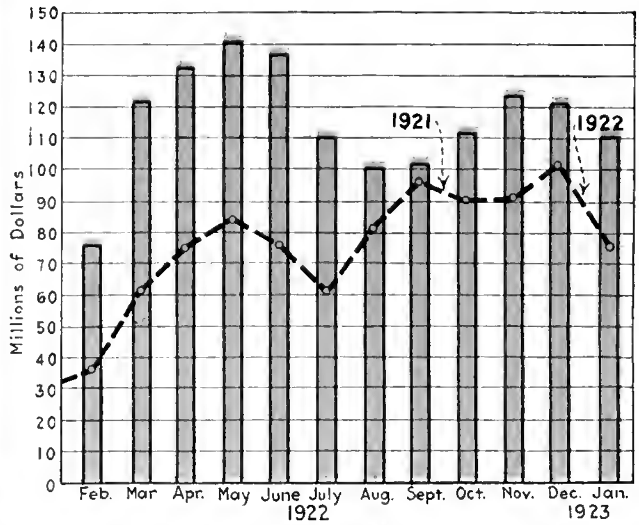
### Record Expansion During 1923

A HIGH DEGREE of expansion in an industry is an excellent indication of prosperity in that industry. When expansion follows a period of general industrial depression and takes on the attributes of high records, then general conditions in that industry may well be considered as of the highest order. Such are the conditions to be found in the electric light and power industry at the beginning of 1923. Based on a careful Electrical World survey, it is estimated that the industry will spend $602,143,000 for additions and extensions to generating, transmission and distribution systems during the present year. This figure is about 86 per cent greater than the estimated expenditures made during 1922 and about 180 per cent more than the 1921 expenditures. Is it any wonder that electric light and power securities have come to be considered one of the safest types of investment possible next to government bonds?

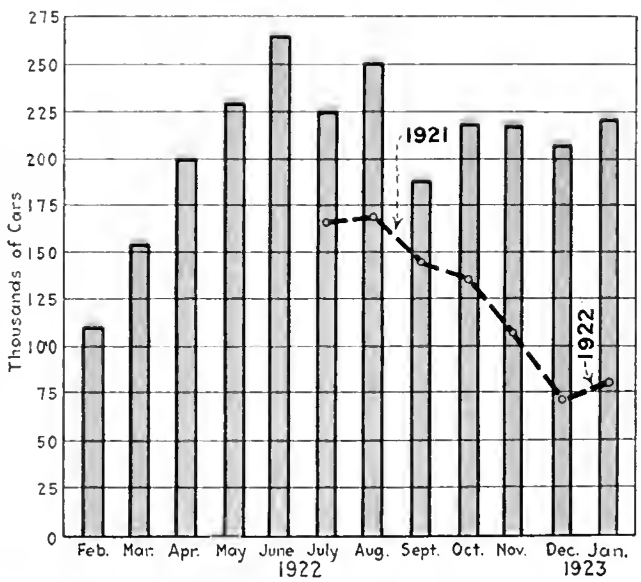
## How the Primary Industries Are Trending



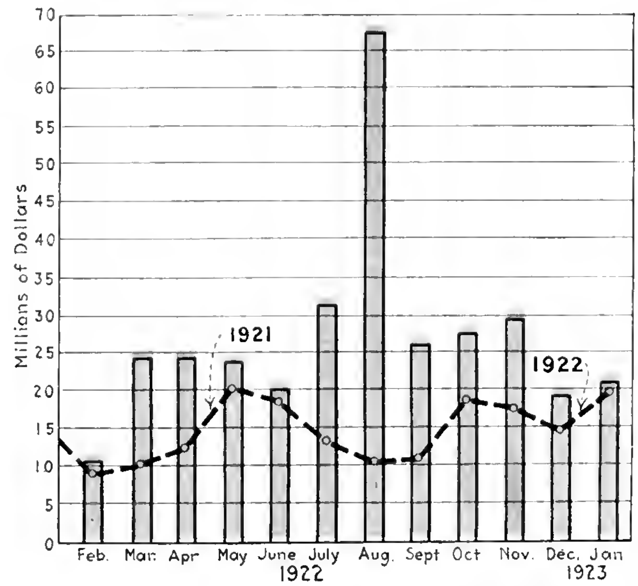
Clay Fire Brick Production



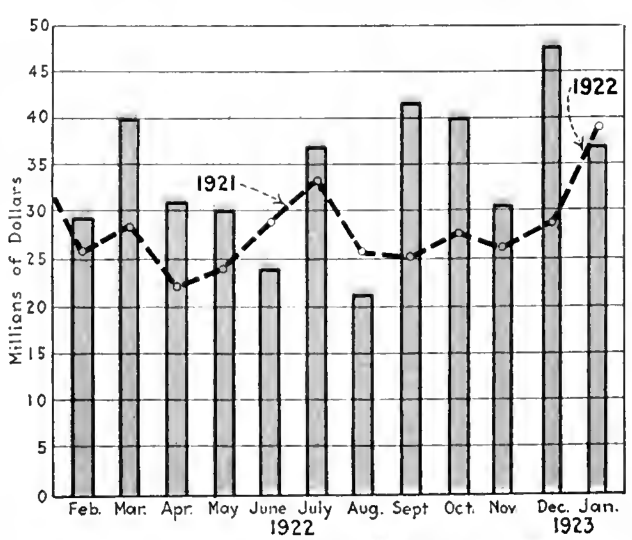
Contracts Awarded for Residential Buildings



Passenger Automobile Production



Contracts Awarded for Industrial Buildings



Fire Losses

## Prospects for Exceptional Spring Activity Crystallizing

GENERAL PROSPERITY, with indications of expansion in the spring, is reflected in the review of the national industrial situation issued by the United States Department of Labor this week. There is very little unemployment reported anywhere in the country, while in some sections, notably in the steel-manufacturing centers, there is a scarcity of unskilled labor. In the typical industrial state of New York factories were taking on more workers; in fact, a shortage in common labor was reported by all districts of the state. Despite the severe weather conditions, building continued active during February and was operating at a faster pace than during January. Prospects for exceptional spring activity have crystallized into actual development in practically every section of the country.

# National Versus State Rights in Water Power

NOT until the United States Supreme Court passes on the question will the rights of the federal and state governments to the water powers of navigable streams be definitely and finally fixed. The federal water-power law of 1920 is generally regarded as a constructive measure. Under it, as the record shows, water-power development has received great impetus. Not only does the law satisfy the conservationists, but it favors state and municipal governments without discouraging private corporations from also engaging in the business, which is a real achievement. That Governor Smith of New York should question the constitutionality of the federal law ought not to give the industry much concern. He is clearly within his rights in so doing, and since the highest court of the land will some day have to pass on the matter the issue might just as well be raised now and by a state which can well present and amply defend its case.

It is none the less an unfortunate condition that pending the outcome of the litigation water-power development in New York will be under a cloud and prospective investors in hydro-electric properties will be discouraged, if not actually deterred, from buying the securities of such companies, much to the detriment of the electrical industry and the growth of many a community. But such temporary handicaps cannot be avoided. They serve the course of orderly justice, and, however irritating they may be, they do not alter the fact that the American people are set on having their water powers developed and no governor or state can alter that determination or stay that program.

This, of course, has nothing to do with state development of water power in New York. That is a horse of another color. What water power is now developed in the state, and it is an appreciable amount, greater than is developed in the whole of Sweden, has been due to private enterprise, and private enterprise is still willing to engage in the work if it receives half a chance. Under the circumstances, therefore, state development is not only uncalled for, but is hardly likely to be sanctioned by either the voters or their representatives at Albany. The Empire State may be all sorts of things, but it is still the Empire State, and its interests are too important and too complex to permit it to be shoved off the well-built road of experience and sanity into the unpaved byways of adventure and socialism.

# William Edward Mitchell

*An electrical engineer of ability and force whose power to organize and to inspire loyalty and enthusiasm has made him an influence in the public utility world.*

TO BE the leader in the design, erection and operation of an electric power system totaling over 200,000 kw. in generator capacity, with 1,500 miles of transmission lines and with particular problems due to its phenomenally rapid growth, shows the ability of a man as an electrical engineer. But to be the recognized human leader to whom the individuals in his organization, from the top to the bottom, turn in time of trouble—personal or otherwise—marks a much larger ability. Such a man is William E. Mitchell, assistant general manager of the Alabama Power Company and one to whom the organization looks as a leading spirit.

Mr. Mitchell was born in Massachusetts, in 1882, of Scotch ancestors. After graduation in electrical engineering at the Massachusetts Institute of Technology, he spent two years in the test course of the General Electric Company, then six years in Brazil with two large power companies in construction and operation, becoming the electrical engineer of the Bahia Tramway, Light & Power Company.

In 1912 he removed to Alabama, where the Alabama Power Company was being organized, and was made the electrical engineer of that company during construction, and then operating manager as soon as the company's steam and hydro-electric plants were ready to deliver power. Mr. Mitchell continued to guide the destinies of the operating end of the company until the world war indicated the need for a strong man to direct the activities of the Anniston Steel Company, a subsidiary producing electric furnace steel for war purposes. Mr. Mitchell was made managing director of the steel company. After the termination of the war he returned to the Alabama Power Company as assistant general manager.

In the eleven years of its existence the Alabama Power Company has grown to be one of the first twenty largest power systems in America. In the building up of this magnificent property in an almost virgin territory William E. Mitchell played a very prominent part. He possesses the necessary physique, experience and magnetism to lead and inspire his organization. All the ruggedness and other traits of character which one associates with men who contend with the forces of nature in the mountains and rivers are his, and like most men who are of the pioneer type he is intensely human.

Mr. Mitchell has been active in National Electric Light Association work in the Southeastern Section, being a past-president and a member of various committees.

# Editorial Comment

Electrical World, March 24, 1923

Volume 81 Number 12

### A Co-operative Opportunity That Should Be Grasped

CONSPICUOUS among the opportunities for co-operation that the future of the electrical industry holds is the chance for increased mutual service between manufacturers and users of equipment. To utilize this opportunity to the full, manufacturers' engineers should be kept in the field to gain the viewpoint of operating, construction and maintenance engineers. Thus fortified, modifications of equipment can be made to meet operating conditions more effectively since the design will have a practical as well as a theoretical basis. On the other hand, many users of equipment will be wise enough frankly to relate their experiences and their troubles. In some cases operating companies can greatly help by permitting the use of their systems or equipment as was done by a number of companies last year. When this is done, the results of the co-operative study by maker and user should be made available to the entire industry and not confined to a favored few. Both manufacturer and operator will benefit considerably if operating conditions are outlined clearly and specifically in ordering equipment and if trouble with existing installations is both recorded and reported.

### The Technique of Post Office Illumination

THE tardy but welcome awakening of the Post Office Department to the essential character of good lighting was celebrated editorially in the ELECTRICAL WORLD a few weeks ago. This week it is glad to put on record in more complete form the recommendations of the Public Health Service on the lighting of post offices that were made at the request of the department and are the evidence that its slumber is over. In many respects the report is a notable one—a signpost on the road of progress that cannot be disregarded. To a certain degree the lighting of post offices occupies a unique position in the art of artificial lighting, and this must be borne in mind in using the report as a guide to practice. Post office lighting is not, indeed, really comparable with those normal requirements of clerical work with which it is likely to be confused. In the first place, post office work involves two distinct working planes—horizontal and vertical—both of which must be brought to a suitable degree of illumination. This at once applies two limitations in luminaire design, a condition quite unusual and one that explains what would otherwise seem to be very needless detail of specification. Second, the work involves the speed element to a degree most exceptional in clerical work, and this in turn, as shown by many recent experiments, brings need for a much higher degree of illumination than would be needed, for example, in ordinary bookkeeping. Finally, the objects worked upon are varied and often extremely bad in color and contrast, thanks especially to the abominable window envelopes, which present a condition similar to the one caused by use of tracing cloth, notorious for requiring exceptionally strong lighting.

It is not surprising, therefore, to find a value of 10 foot-candles initial set as the standard for post office workers. Considering the conditions and the certainty of the standard falling presently to 7 or 8 foot-candles, the basis is none too high from the standpoint of real efficiency. Another commendable feature is that the specific brightness of the globes is kept low and linked to the light flux of the lamp, so that there may be no overloading of the globe for the sake of cheapness, a fault which seriously impairs the usefulness of many commercial units. The report is a piece of constructive work of real value to the art of lighting, and it deserves to be appreciated and acted upon.

### Contrasts in Attitudes on Public Relations

CONTRASTS in the method of attacking the public relations problem were presented at the joint session of the recent conventions of the Oklahoma Utilities Association and Southwest Geographic Division, N. E. L. A. John W. Shartel in a few minutes' extemporaneous talk excoriated the public, the politicians, the legislators and the utility commissions for their unfair attitude toward utilities. Henry S. Ives, an insurance man, in what he frankly said was intended to be an alarmist effort, painted in somber colors all the possible horrors of state socialism in business. On the other hand, Labert St. Clair, in a homely little story of Aunt Sally Ann Dusenbury, the typical friend, confidente and indispensable village angel, painted the public as "just folks" who can be reached and touched by a little understanding human treatment. John W. Gleed, in an equally homely and forcible manner, emphasized the same thing and told his hearers that escape from too drastic state regulation and extreme political action lies entirely in the hands of utility men themselves, because in dealing with the American public they are simply meeting average human beings who are trying amid perplexing circumstances to be fair and to do the right thing. The method of helping the public to be decent and right is the method so little tried of "Do unto others as ye would they should do unto you."

Messrs. Shartel and Ives may have relieved their feelings and may have aroused a few who lay in lethargy; but Messrs. St. Clair and Gleed have caught a vision of the fact that in the hands of business men, and in their hands alone, lies the determination of the question of how far government will enter into business. Government is now in utility affairs principally because men early in the utility business—from the steam railroad to the central station—could not see that self-regulation is the only substitute for governmental regulation and that one or the other must exist.

Similar arguments apply in other fields of business,

and some of the recent occurrences in the commercial and industrial world, notably in the coal industry, furnish an interesting study as to why the governmental authorities get into business. Until business learns to practice self-regulation the march of government into business, with all its painful mistakes, inefficiency and economic blunders, will continue. Speeches such as those of Messrs. Shartel and Ives are likely only to add fuel to the flames. Why waste the energy? The attitude of Messrs. St Clair and Gleed represents the best thinking of progressive men in all utility fields.

## Co-operation Will Hasten the Use of Electrical Energy on the Farm

STRIPPED of the excess verbiage with which it is sometimes surrounded, the problem of using electrical energy on the farm is purely an economic one. On the one hand, the electrical industry has a service to sell; it must be able to sell that service at a profit. On the other hand, the farmer wants to buy that service; he must be able to use it at a profit. The American farm is a producing agency and as such has its producing and sales problems. These problems are in no way different in principle from those of any other business; but in organization features the agricultural industry is different from others, since it consists of small units with all the limitations that small units must have when big problems are being faced.

The farmer, in spite of opinions to the contrary, is a real user of power. The best supply and use of this power is basically a technical problem. Other industries in the past quarter of a century have attained a development in the use of power that is a direct result of the degree to which it has been possible to bring the best of technical talent to bear on their problems; but the farmer has not had the advantage of tremendous business organizations and the consequent power to deal with technical and business problems in the most efficient way. This lack of individual ability to handle technical problems is being supplied by the development of the experimental stations and agricultural engineering schools of America. These have already done a tremendous technical work in the development of agriculture. With them must lie the burden of the research work involved in the solution of the entire problem of farm power. The electrical industry has much to offer to help in this work. The more it co-operates with the technical research agencies established for the benefit of agriculture, the more rapid will be the progress toward a final solution of the problem of the use of electrical energy on the farm.

## Inductive Effect on Radio Receivers a Future Problem

IN THE last year the term "inductive interference" has taken on a new meaning of rather serious import. This time it is not the signal interests that are involved but the section of the general public which is making intensive use of the radio receiver. Physical hazards due to the installation of an antenna close to light and power lines were the trouble brought to the attention of the central-station operator in the first few months of the development. Now the novice is learning that, while static disturbances may be the explanation of a great many of his receiving troubles, some of the troubles styled static may be due to other causes. A number of cases have been noted where wise amateurs have taken a loop and a simple receiving set, located faults on a transmission or distribution system and asked the power company to eliminate them.

The seriousness of the situation is that the people affected represent an influential section of the public. As they find there are cases in which power circuits cause inductive effects they will, in ignorance, naturally lay other troubles to the same source. The suggestion of one utility operator that the existence of such trouble should not be admitted will not help the situation. Whether he wants to or not, the central-station operator must pay attention to this phase of radio development and keep the confidence of his public so that any cases of inductive effects will be reported to him first and he will have an opportunity to straighten them out or educate the complainant to the fact that there are other sources of trouble and also that there are some inductive effects that are normal and cannot be eliminated without serious curtailment of electric light and power service. The opportunity is now present to guide radio development and prevent interference questions from getting before public regulatory bodies. Ignoring them only makes them more acute with a slight postponement of the day of reckoning.

## "Our Representative the Contractor"

THERE is nothing new in the idea that the contractor represents the central-station company at least as an indirect solicitor of business. But it is not so generally realized that many a new customer's ideas of the central-station organization are formed by the contractor's opinion of the utility. The contractor and his men enter a residence or a business establishment to install wiring, and very often a discussion of the local electric service company and its practices follows during the period of work. If the customer's contact with the utility has been confined to the application clerk, and if relations are not good between the electric company and the contractor, an initial prejudice may be formed in the consumer's mind which is very hard to dislodge.

In a community where the utility plays fairly with the contractor and vice versa the new customer starts with the impression that all is well with the local electrical industry. He may not put it into words, but this establishes a groundwork of confidence which encourages the purchase of electrical devices and the provision of a wiring installation somewhere nearly adequate to the local conditions and opportunities. There is still a vast amount of ignorance anent things electrical on the part of the public, and it is to the vital interest of the industry that local trade relations shall be excellent.

Where merchandising is done on a list-price basis, with fair dealing and open competition, good feeling is pretty sure to abound. Where the central station works in accord with the contractor, taking into consideration his views when framing its service rules, giving him when feasible an opportunity to share in special appliance campaigns, and in general treating him as "one of the family," popular confidence also in the local electrical interests is enhanced and prosperity is stimulated. An embittered contractor, on the other hand, constantly struggling to make both

ends meet across the gap of price cutting or other concessions in a community where the electrical league spirit has found no outlet, can do as much harm to the electrical trade as a "sore" utility employee. Square dealing between all branches of the industry is its own justification, but in realizing this central-station executives will do well to ponder the contact of the contractor-dealer with the customer and its potentialities for good.

## Shall the Central Stations Establish a Research Organization?

THE central-station industry has attained a velocity which gives it a tremendous momentum. Every operating company is strained almost to the breaking point to satisfy the demands for light and power service. Every company rushes from the completion of a generating station to the installation of new feeders, transformers and substations in order to keep pace with the rapid increases in load. Clauses in rate systems are added or changed overnight to take advantage of new applications of electricity and new conditions in the ever-expanding loads. The manufacturers continually bring out new or more efficient apparatus. Is it any wonder that men in the operating organization find their time fully occupied with the daily operating duties?

But the rapid growth and expansion of central-station properties and operations inevitably have brought about conditions on the systems which do not result in economical or the most efficient operation. Men engaged in building new stations and new lines have little time to study the efficiency or economy of the existing systems after they are installed and still less time to engage in developmental research for future needs. Yet load conditions change on the old installations; power transformers become overloaded or underloaded; feeders become too large or too small for the loads they carry; the distribution layout becomes inadequate or cumbersome as the population shifts in locality or occupation; the power stations contain equipment that might economically be replaced by new and more efficient apparatus; substation apparatus gets obselete rapidly, and practice changes as new developments occur. Changing needs and advanced technical information make possible research developments that would secure more efficient operation.

Just recently there has been a very decided recognition of the conditions outlined, and a marked trend toward greater efficiency in operation is noticed. In most cases the management has recognized that the operating staff is too busy with necessary, even if semi-routine, duties to devote any time to efficiency studies, and in many cases a new department has been established for carrying out studies designed to secure greater efficiency, more economical distribution of equipment or better apparatus for obtaining desired results. In some companies this department devotes its energies to power production, studies the power-station equipment in the existing plants and works out the design problems for new stations in so far as they deal with thermodynamics; in other cases certain men study the distribution system to determine the most economical layout for copper and transformers, and in still other instances men are detailed to study problems connected with the operation of some particular part of the system. In nearly every instance these special-duty men are relieved of operating routine and are selected for their technical ability. They have proved their value and become increasingly important as a system grows in magnitude. In one instance college professors are used to advantage during the summer; in other organizations specially selected technical men work under the direction of the chief executive. These men prepare special reports on power-factor-corrective apparatus or rates, transformer capacity for industrial installations, relative merits of distribution systems, economic layouts for feeders and substations, and also do some research work in testing out new equipment developed by manufacturers, or even develop equipment for special operating requirements.

This move has a real importance and is warranted by existing conditions. Major economies are being obtained on many systems and the extent of this movement cannot be gaged. It is a good time to question whether the specialists in the ranks of the manufacturers should longer be called upon to serve as the research men and technical advisers for the operating companies—whether they cannot apply their skill much more effectively to the development of new equipment or technique. Furthermore, the properties on which the research problems exist are usually large and widely scattered and are complicated by local conditions which make it imperative that the special problem men be familiar with the system continuously. Many of the problems are largely economic and involve confidential information.

It has been definitely recommended by some who are studying the question that steps be taken to develop a co-operative research organization, backed and financed by the central-station industry, which will apply itself to the technical problems. Certainly, some method of advancing co-operative work along such lines would prove of advantage. If such plan is to be carried out, thought should be devoted to securing development along sound lines and steps can be taken immediately to avoid duplication of effort on the part of individual companies.

## What Does Appliance Servicing Cost the Central Station?

ONE of the problems under consideration in central-station commercial circles in many parts of the country is how to reduce the cost of appliance servicing. In too many cases this has been overlooked, and the need of more data upon the subject is undeniable. Practice varies considerably in operating companies as to repair cost accounting, rules as to guarantees, minimum billing and no billing at all! One important operating syndicate is now making a thorough study of the whole subject in the hope of arriving at some real costs and thereby sounding the safe depths of the commercial channel for future passage and a standardized course, if feasible. It is a safe bet that appliance servicing costs more than is ordinarily credited to it, not only in the central-station field but among electrical retailers in general. In some cases efforts appear to be fairly successful along the line of combining servicing work with other customer-contact activities; in other communities the public accepts minimum charges for repairs as a matter of course. Further steps toward assembling and studying servicing costs will yield valuable information to the industry if the results are made generally available by operating companies.

# Water-Power Resources Aid Norway

The upper view shows a valley in Norway before the development of its water-power resources. The lower view shows the same valley after the site has been developed for the Rjukan station, which supplies power to the large saltpeter factory. About 100,000 hp. is utilized in Norway for making saltpeter by electrical processes. Furnaces of 4,000 kw. of the Birkeland-Eyde type are used in this factory in the city of Rjukan. These furnaces use a strong electromagnetic field to spread and draw out the arc.

# Water Powers of Norway

## A Realization of Its Vast Power Resources Has Brought the Scandinavian Kingdom to the Front as an Industrial Nation—In Norway More than 5 Hp. per Capita Is Available from Hydro-Electric Developments

By C. N. ANDERSON

THE general idea of Norway is of a land full of milk and honey because of the prevalence of cheap electrical power. As the result of an extended tour of the kingdom the author of this article describes the whole Norwegian situation in a way that co-ordinates the engineering developments and their effect on industrial and social conditions. In studying costs the reader must consider the relative purchasing power of money in Norway and the United States, but the data afforded are interesting and valuable to all conservationists.

IN ACTUAL power, Norway has more hydraulic horsepower than any other country in Europe, and when one takes population or area into account it leads the world. With a maximum of 12,000,000 available horsepower distributed over less than 125,000 square miles and among a little more than 2,000,000 people, there is an average of 100 hp. per square mile and more than 5 hp. per individual. Compare this with the United States, with 6 hp. to 10 hp. per square mile and from ¼ hp. to ½ hp. per individual. Of the 12,000,000 hp., 1,650,000 is developed, leaving an enormous amount waiting for a market or for the capital to develop it. The first electrical power station in Norway was built in 1885. Today there are more than two thousand, and few buildings, urban or rural, are without electric lighting and few homes without electric stoves and cooking apparatus.

The uses to which the power is put are many and varied. One-quarter of it is used directly by sawmills, pulp, paper and grist mills. Of the remainder approximately 10 per cent is used for light, 10 per cent for heat, 60 per cent is utilized by large electrochemical, electrometallurgical and electrothermal industries and 20 per cent by railways and for miscellaneous purposes. Just what the future consumption will be is a matter of speculation. With a continued increase in population at the same rate at which it has increased in the past hundred years it will be another century before the present population will be doubled. Allowing 1 kw. per individual at that time, 1,500,000 kw. for heating city buildings and 500,000 kw. for railways, there is still left from 2,000,000 kw. to 3,000,000 kw. for the use of the large industries.

The reason for the large allotment to individual use is that a strong feeling against capitalism prevails and every means is being taken—almost to the extent of absurdity—to hinder anything but community development of Norway's greatest natural resource. "It belongs to the people and it is the people who shall reap the benefits" is the cry. Public ownership is, however, no better here than anywhere else—probably worse. Norway is not a rich country and cannot appropriate at one time enough money to carry a development through within a few years, but rather appropriates a little at a time. This means that the work is spread out over a long series of years, enthusiasm wanes, progress slackens, personnel changes and so do plans.

Moreover, some of the plant designers are addicted to extravagance when the community is to pay the bills—trying to incorporate every little whim, to include every possible piece of apparatus, so that it will be impossible for any one else to say: "We have something that you haven't." Such practices can only result in a more expensive output and a decrease in demand.

Low as the cost of energy is, a consumers' strike is not an unheard-of thing in Norway. The cost figures given below are for the year 1919 at normal rate of exchange:

| | Range | Average |
|---|---|---|
| Horsepower-year | \$15.00—\$65.00 | \$25.00 |
| Kilowatt-year—light and heat | 35.00— 90.00 | 45.00 |
| Kilowatt-hour—light | 0.06— 0.20 | 0.08 |
| Kilowatt-hour—power | 0.025— 0.15 | 0.05 |

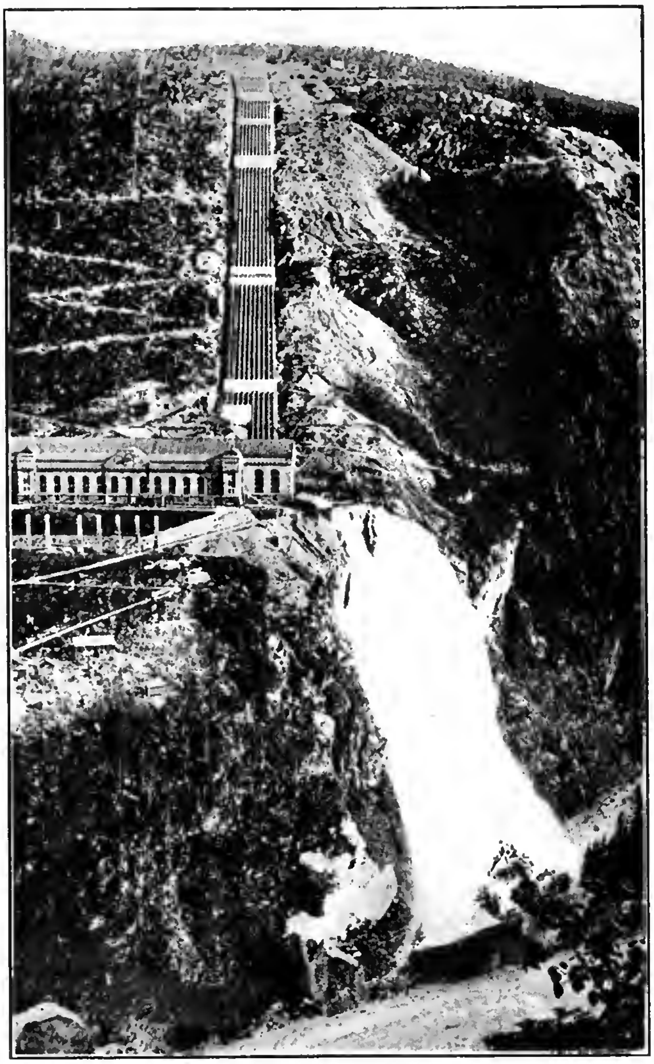
As these prices were under pre-war contracts and continued through the period of inflation the equivalent cost in dollars at the present time is from one-half to three-quarters of the figures given. One notable

AT SARPSFOSS 58,000 HP. IS UTILIZED BY TWO POWER STATIONS, ONE OF WHICH USES THE ENERGY TO PRODUCE CELLULOSE

example of cheap power is the case of the city of Christiania, which buys from Kykkelsrud, under a contract not expiring before 1948, 20,000 kw. at 35 kroner ($9 normal exchange, $6 present) per kilowatt-year. At a later date 4,000 kw. additional was contracted for at five times the previous price.

In contrast with the American farmstead, practically all of the farm buildings not too far back in the mountains are supplied with electricity for light, heat and power. The farmsteads are not large, so that where the land is tillable at all the different homes are so near together that one transformer is sufficient for several farms. Voltage and frequency for the most part have wide limits, and transformer losses are not taken into account, for the reason that the energy is sold by the kilowatt-year. The common voltage is 220. Power consumption is limited to the amount to which the consumer is entitled by a time-acting relay called a "vipper," of which there are several types. This intermittently breaks the circuit when the power consumption exceeds the predetermined amount.

There has been considerable discussion about the exportation of power. Sweden is fairly well supplied, with the possible exception of the territory on the Norwegian frontier. Denmark, on the other hand, is dependent entirely on steam generation, and at present there is much discussion over the projected export of 100,000 kw. to that country. There is so much skepticism, however, arising from the conditions which are to be met, the problem of financing the undertaking and the question whether Norway can afford to contract away a hundredth part of her power that it will probably be many years before the exportation will become a reality. The plan would be to transmit power either by high-tension direct-current cable from Arendal or Christiansand under Skagerrak to Jutland, a distance of a hundred miles, or by an alternating-current transmission line along the Swedish coast to the vicinity of Gothenburg and then by cable under Kattegat to the island of Laesö and then to Fredrikshavn. Copenhagen is already supplied by power from Trollhättan, Sweden.



THE RJUKAN 1 STATION DEVELOPS 162,000 HP. AND SUPPLIES POWER TO SALTPETER FACTORIES

The power utilized by the large industries is devoted to the manufacture of carborundum at Eydehavn near Arendal; ferro-chrome, ferro-silicum, and ferro-molybdenum at Meraker, Tysse, Eydehavn and Sarpsborg; carbide and cyanamide at Odda, Bjölvo, Meraker, Kragerö, Sarpsborg and Saude (under development); aluminum at Eydehavn, Christiansand and Höyanger; sodium at Fredrikstad, copper and nickel at Kopperaaen and Sulitelma, iron at Ulefoss, steel at Stavanger, saltpeter at Christiansand, Notodden and Rjukan and in other smaller cities.

Of these, the saltpeter industry is the largest, and the town of Rjukan, with its good homes and shops, parks, public library and waterworks, bountifully supplied with electricity, is an excellent example of how engineers may bring modern civilization to what a few years before was an almost inaccessible wilderness.

Norway can be divided more or less naturally from both a geographical and a hydraulic standpoint into two divisions—northern Norway and southern Norway. The former consists of a long narrow strip extending from the Russian frontier east of Nord Kyn and Nord Cape, the two most northerly points on the mainland of Europe, to the vicinity of Trondhjem. Here the peninsula widens out into the lobe which is usually called Sydlige Norge. This part not only has the most inhabitants but also 80 per cent of the available water power.

The mountain divide which runs approximately north and south in Norway, a little to the west of the median meridian, forms a divide for the streams. On the west side the streams are numerous and short and consequently have high heads without an exceptionally large amount of water, in spite of the fact that they are in the region of greatest rainfall. On the east side the streams are longer and heads are not so high, but there is a larger amount of water on account of the large drainage areas. A convenient grouping of the waterfalls can be made by dividing the country into northern Norway, western Norway, southern Norway, and central and eastern Norway, as follows:

| Section | Hp. Available | Hp. Developed |
|---|---|---|
| Northern Norway | 2,700,000 | 152,000 |
| Western Norway | 5,050,000 | 500,000 |
| Southern Norway | 2,180,000 | 622,000 |
| Central and Eastern | 2,610,000 | 380,000 |
| Total | 12,710,000 Hp. | 1,654,000 Hp |

The available power does not include waterfalls, in which pre-war construction would cost more than $125 per turbine-horsepower, or falls which without regu-

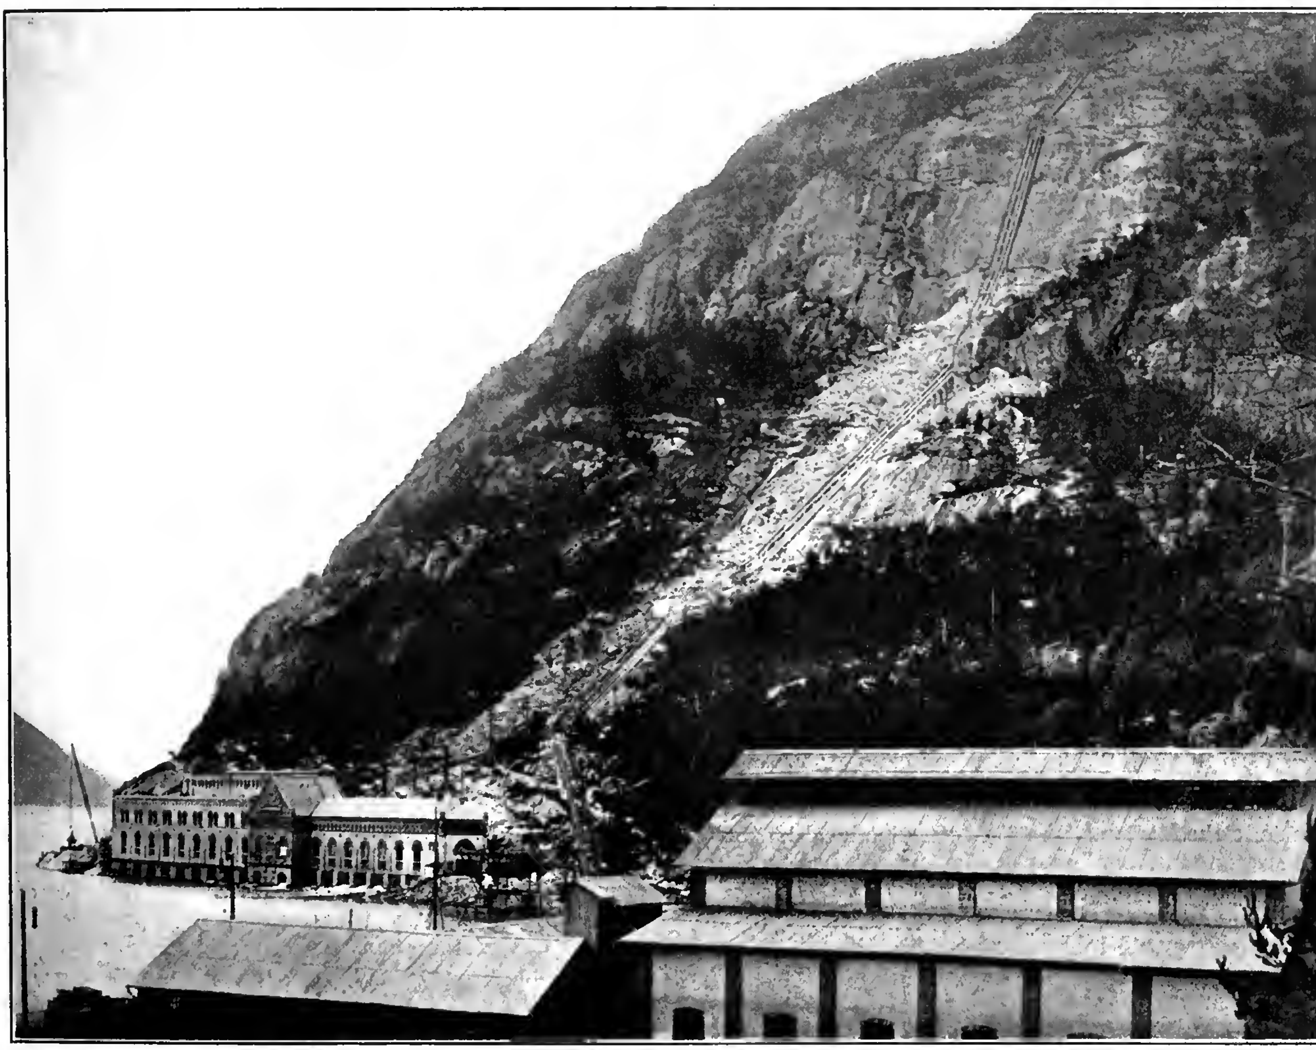
lation would give 1,000 hp. If other sites are included, the total would be increased by 20 per cent.

### Water Powers of Northern and Western Norway

The water powers of the provinces of Finmark and Troms are for the most part not large but may be of great importance in supplying light and heat for the scattered inhabitants, who live by artificial light for a large part of the year. At present only a few sites are developed, one supplying Hammerfest, the most northerly city in the world, which lies 200 miles within the Arctic Circle. Another, Kaafjord, supplies power and light to an observatory where many investigations of the aurora borealis have been made.

The largest developed power site in northern Norway is on the River Fykanaaga, usually referred to as the Glomfjord development. It is situated on the Glomfjord, 30 miles south of Bodö, 20 miles north of the Arctic Circle and close to Svartisen, the only known glacier in Europe which descends right down to the sea. As there was no natural place for the power station, the river was diverted through a tunnel into the sea and the power house built directly across the old channel. As a first development there are installed two Pelton turbines of 25,000 hp. each and one of 27,500 hp. with a head of 1,450 ft. Each turbine has two runners with one nozzle for each runner. There is only one turbine bearing, the other end being coupled to the generator shaft, which is equipped with two bearings. The generators have a continuous output of 22,000 kva. at 80 per cent power factor and are operated at 25 cycles and 14,000 volts to 15,000 volts. The total available horsepower is 143,000.

Numerous sites are found along the fjords on the west coast of Norway. Of these fjords, Sognefjord is the longest and one of those most frequented by tourists. About 100 miles long, it is nowhere more than 4 miles wide, and in some places almost sheer mountain walls rise above waters 4,000 ft. deep. In the mysterious recesses of its gloomy gorges the old Norse mythology had its home, and they should be the last retreat of those trolls and gnomes by whom they were believed to be inhabited long after faith in Odin, Thor and Freya had been abandoned. In some of the deep ravines the light of the sun does not penetrate for months.

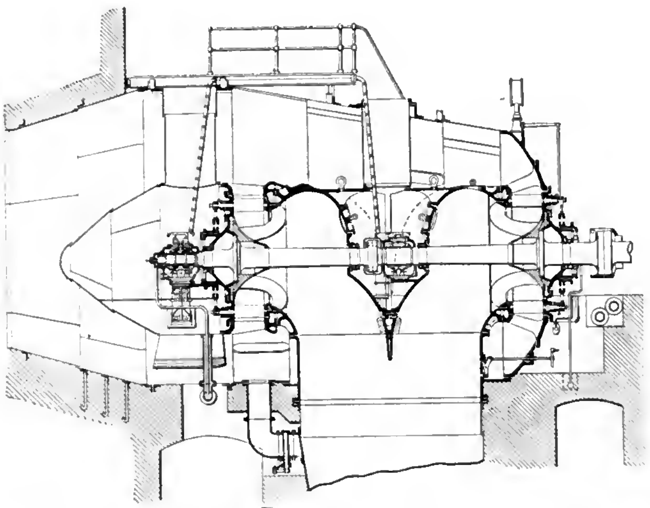


TYSSEDAL STATION DEVELOPS 142,000 HP. WITH A HEAD OF 1,277 FT. AND SUPPLIES POWER TO CARBIDE AND CYANAMID FACTORIES

Aalesund and the immediate community are supplied with light and power from the power station at Tafjord, where two generators with a capacity of 7,300 hp. each are installed. This is the only development in Norway in which the transmission is at a higher voltage than

65,000 volts. Here the transmission voltage is 150,000. The Hoyanger plant of the Norsk Aluminum Company is situated on the Hoyangerfjord, an arm of the Sognefjord. Here are installed seven 4,500-hp. generators driven by Pelton turbines. Each generator is rated at 300 volts, 10,000 amp., direct-current, and they are said to be the largest direct-current generators in the world driven by water power. The problem of regulation was a little difficult in that the generators were required to work under heads of from 1,840 ft. to 2,460 ft. and under conditions in which the load was often thrown entirely on or entirely off.

The Bjölvo power station on the Hardangerfjord is unique for several reasons. The river is very short and has a drainage area of 25 square miles only. There is a small natural regulation basin in the Bjösegrönvandet from which a tunnel leads down to the distribution basin, then through a 1,500-m. tunnel and finally through penstocks from a point 1,485 ft. above sea level



HORIZONTAL DRUM TYPES OF DOUBLE FRANCIS TURBINES ARE USED IN THE VAMMA STATION. EACH UNIT DEVELOPS 12,000 HP. AT 214 R.P.M. UNDER A 90-FT. HEAD

down to the station. The total effective head is 2,860 ft. There is only one penstock at present, 5 ft. 10 in. in diameter at the top and 2 ft. 8 in. at the bottom. The lower part of the penstock is of ½-in. steel pipes reinforced by 1½-in. x 4-in. steel bands 12 in. apart center to center. The three 12,300-hp. units are driven by Pelton turbines. The generators are three-phase, rated at 10,750 kva., 12,000 volts, 50 cycles, 375 r.p.m., with direct-connected 77-kw. exciters. This station has the high-tension apparatus mounted out of doors—one of the few such installations in Europe. No trouble has ever been experienced, although the station is in a region where it rains three hundred days out of the year and at times the apparatus is almost buried with snow.

The largest developed site on the west coast is at Tyssedal. The drainage area of the system is less than 200 square miles and is composed for the most part of a bare mountainous section at an average of 3,500 ft. above sea level. In this section lie numerous small lakes which empty into a larger lake, Ringedalsvand, 3 miles from Sörfjorden and 1,500 ft. above sea level. At the outlet of this lake there is one of the largest dams in Scandinavia, with a length of 1,700 ft. and a height up to 110 ft. The regulation basin can hold 300,000,000 cu.m. and can be regulated through 155 ft. Two tunnels, more than 2 miles in length through solid bedrock, conduct the water down to the distribution basin 1,400 ft. above the sea, from which five penstocks lead down to the station. There are installed fifteen Pelton units of various capacities aggregating 141,840 hp. In order to utilize the head between the distribution basin and the level of the drainage area it is planned to construct a second station at Ringedalsvand which will be as large as, if not larger than, the present development.

There are five sites in the Saude drainage system, not far from Stavanger, two of which are developed. American machinery is used.

### WATER POWERS OF SOUTHERN NORWAY

Most of Telemarken is drained by two large river systems, Eidselven and Tinnelven, which unite in the Nordsjö, the outlet of which (Skienselven) flows by Skien and empties into Langesundfjord at Porsgrund. There are several large sites on Eidselven, but only a very small portion of the power is developed. Tinnelven is fed chiefly from Maarelven and Maanelven through the Tinnsjö. The regulating basin of Mösvand, 3,000 ft. above sea level, serves six stations—Rjukan I, Rjukan II, Aarlifoss, Svaelgfoss, Lienfoss and Tinfoss.

The Rjukan I (Vemork) station was built by the Badische Anilin & Sodafabrik, with 80 per cent of German capital, to supply power to the saltpeter works at Rjukan. It was set in operation in 1912, and with its 162,000 hp. it stands near the top of the list of world's hydro-electric power stations. It was built at a time when much of the machinery of the size required was more or less in the experimental stage. In fact, the whole station was built with more or less skepticism. For that reason we find it half way up the mountain side, and for a long time much of the power went to waste. Later Rjukan II (Saaheim) was built, 4 miles away, to develop power from the discharge water of Rjukan I. A gain of about 325 ft. is made by placing the Rjukan II station down where it is instead of at the bottom of the gorge below Rjukan I. If the development were being made today, the whole station would no doubt be placed at the site of Rjukan II and the whole head utilized by the one plant. On account of the deep and narrow valley in which Rjukan lies, one does not see the sun directly for nearly six months out of the year. In order to make conditions better and also to facilitate transportation, the saltpeter factories would probably be placed 10 miles farther down the valley, on the shore of the Tinnsjöen.

From the distribution basin nearly a thousand feet above the station eleven penstocks from 4 ft. to 6 ft. in diameter conduct the water down. Each penstock is divided to supply one turbine. These are of the double Pelton type with two nozzles for each runner. The turbine efficiencies have recently been raised from 70 to 88 per cent by a slight change in the needle and bucket design.

On account of the lack of confidence at the time of installation in the construction of a single generator of the size necessary, each generator consists of two entirely separate generators on the same shaft inclosed in the same generator housing. They have their own excitation regulation and are fed from their individual transmission lines. The three-phase unit is rated at 14,500 hp., 16,800 kva., 11,000 volts and 50 cycles.

The Saaheim station is within the limits of the town of Rjukan, about 4 miles below the Vemork

station. From the discharge canal of the latter station the water is led down to the Saaheim station by means of a tunnel blasted out of solid rock. This tunnel is a little over 100 sq.ft. in cross-section and has a possible delivery of 2,275 cu.ft. per second. It lies from 100 ft. to 200 ft. deep in the side of the mountain, sloping about 40 ft. in the four miles, ending in a distribution basin blasted out of solid rock inside the mountain. From the distribution basin there go nine penstocks laid in three separate tunnels also blasted out of bedrock. The reason for the grouping is to insure safety in case any of the penstocks should burst. The station building is well built from both the practical and the architectural standpoint. It is constructed entirely of reinforced concrete and houses the furnaces of the saltpeter factory as well as the power station. This combination was resorted to chiefly for one reason and was incidentally made advantageous from two other standpoints. The main reason was to avoid the paying of several million kroner for a new concession, the concession under which the present arrangement was built being an old one and under old laws. In carrying out the plan the transmission system was considerably simplified. The method adopted is such that the necessary cooling of gases takes place in their transport to the saltpeter factory, two-thirds of a mile distant. The gases are first passed through steam boilers which furnish power for three steam turbines and the steam used in the manufacture of saltpeter.

The generator bay in the main building houses the ten twin-runner turbine-driven Pelton units. The turbines of three of the units are equipped with directly connected oil pumps, which not only present a good appearance but take up no space to speak of and are very dependable. The generators are three-phase, operating at 9,500 volts and 18,800 kva., with directly connected exciters. The total output is 150,000 hp.

The switching is of the simplest. One divided bus makes it possible to have any one generator supply power to any furnace. This is rarely necessary, however. It is so only in case one generator unit and a furnace not corresponding to it become inoperative at the same time. For the most part, each generator supplies its corresponding furnace direct, with instrument transformers and excess-current relays on the second floor, knife switches and bus on the third floor, and knife switches on the fourth floor to the choke coils and furnaces in another part of the building. There is no automatic protection except the excess-current relays which operate circuit breakers in the excitation system.

Aarlifoss, Lienfoss, Svaelgfoss and Tinnfoss form a group of stations in the vicinity of Notodden.

The Nore Falls are about 40 miles northwest of Kongsberg and have more than 300,000 hp. available. The sites are owned and are being developed by the state. The work has been spread over several years and numerous plans have been studied. At present work is proceeding slowly with the dam and tunnels.

Vittingfoss and Hakavik are interesting stations, the former being one of the few vertical-shaft installations in Norway. The latter supplies power for the Christiania-Drammen railway, which was changed over from steam last summer.

Nearly the whole of the eastern and central section of Norway is drained by the River Glommen. It is Norway's largest river system and drains one-eighth of its area. There are four or five large undeveloped sites in upper Glommen, but interest is largely directed to the group of five large stations situated within a few miles of each other near the mouth of the river.

Raanaasfoss is 30 miles east of Christiania and has 48,000 hp. of the available 72,000 hp. developed. It is a fine example of power-house construction and is unique in several respects. Two large sector gates 165 ft. long in the middle of the 660-ft. dam are among the largest of their kind. On one end is a rolling gate 150 ft. long and 21 ft. high. The Francis turbines are of horizontal double-runner type, set in open flumes, requiring 3,500 cu.ft. per second under the 40-ft. head for a full load of 11,200 hp. at 107 r.p.m. On account of the low head and the exceptionally low speed, these turbines are unique. The generators are monstrous affairs with rotors 26 ft. in diameter. They have a capacity of 12,000 kva. at 7,500 volts and 50 cycles. Four of them are installed.

The Mörkfoss-Solbergfoss development is at present under construction, and 194,500 hp. will eventually be developed under a head of 70 ft. The dam is built directly across the river, with an auxiliary station placed directly over the old channel housing three 15,000-hp. units. The main station is to be parallel with the river channel and will contain thirteen 11,500-hp. turbine-driven units. All modern European practices are made use of in this station. There are two low-tension buses, but the plan is to operate the generator and transformer as a unit and to parallel on the high-tension side by means of two sets of buses each sectionalized for two units to which the outgoing lines are connected by oil breakers and knife switches. The transformers are equipped with Petersen coils. This station is being built by the Norwegian state and the Christiania commune.

### Low-Head Stations Occur on Glommen

The Vamma power station is a fine example of a modern large low-head station and has been in operation since 1915, furnishing power to Christiania through the Kykkelsrud station and to Fredrikstad and Fredrikshald through the Hafslund station. The dam is 920 ft. long and 130 ft. high. The entrance to the fifteen penstocks is protected from floating débris by trash racks provided with electric heating to prevent the formation of ice. The two 70-ft. and 90-ft. rolling gates are also provided with electric heating. The power house is very attractive, with a plaster frieze on the wall of the generator room and air outlets attractively latticed. Seven units of from 12,000 hp. to 15,000 hp. are installed. The horizontal twin turbines are of Francis type. More than 150,000 hp. is available.

The Kykkelsrud station, with 46,000 hp. of its available 65,000 hp. developed, is situated almost within walking distance of the Vamma and Mörkfoss-Solbergfoss stations. It was built twenty years ago and so is of old design, with old machines and old switching equipment. Two Swiss turbines of obsolete design have the gate opening varied by a cylinder which, moving up and down, varies the width of the opening and also the effective width of the runner. A set of seven siphons used to keep the level of the dam constant is interesting.

Most of the power from this station is transmitted by means of cable to a very modern transformer station a few hundred feet distant, which in turn transmits the power to the city of Christiania. A telephone oper-

ated by means of carrier current over the high-tension power lines is in very satisfactory operation between this transformer station and the corresponding one at Toien, near Christiania. This is one of the earliest carrier-current installations in Norway.

One of the very first stations in Norway was built at Sarpsborg. The power available here is utilized by two other power stations—Hafslung and Borregaard. The dam is common to these two plants and the regulation is taken care of by a company that transports logs on the river. The stations are not particularly interesting except from the standpoint of noting the development made in power-house design and machinery in the past twenty-five years. Part of the power of the Borregaard station is used in three electric boilers in which the electric current flows through the water between two electrodes. Each boiler has a capacity of 2,000 kw., 4,400 lb. of steam per hour, corresponding to 2,500 tons of coal per year. The annual saving is calculated at $20,000.

The foregoing is an attempt to give an idea of the status of water powers and their development in Norway at the present time, detailed descriptions being far beyond the limits of this article. Norway has a high density of electrical power and her solution of its disposal is going to be of interest. The fine examples of hydro-electric engineering which now exist in that country and her success in bringing electric light and power within the reach of the isolated peasant are an excellent beginning, but the replacement of black coal by "white" on her railroads and merchant marine, the financing and developing of a market for her large industries and the extension of the power network to every nook and crevice in the land form no small task.

# Illumination of Post Offices

## Experts, After Investigation, Advocate a Standard System Throughout the Country that Will Insure 10 Foot-Candles on Working Planes

AT THE request of the postmaster-general, the Office of Industrial Hygiene of the United States Public Health Service made a survey of one old and one comparatively new post office to determine whether the prevailing illumination is sufficient, and of such character and strength as will promote the greatest efficiency of the occupants. The conclusions are now available, and were briefly reported in the Feb. 24 issue of the ELECTRICAL WORLD. They are interesting in their details not only as they bear on post office lighting but for their relevancy to illumination in general. The report says in part:

"The illumination in the post offices studied was found to be low in intensity and unsatisfactory in quality. Glare is prominent, shadows are numerous, lights are improperly spaced and improperly located in relation to work, and the intensity of illumination is irregular and unequal. The actual mean illumination in these post offices is generally below the state codes of lighting requirements and is generally lower than the mean illumination which is furnished employees doing similar work in private industries.

"There seems to be a definite relation between certain diseases of the eye and defects of the vision and the amount of illumination under which similar groups of workers were occupied. In this respect it was found that the employees at the old post office, the majority of whom were working under an average illumination of 2 to 3 foot-candles, had less than normal vision and a greater number of certain defects than the employees at the new post office, the majority of whom were working under an illumination of 3 to 4 foot-candles and a not inconsiderable number under part-time daylight.

"The higher the intensity of illumination up to a certain point, varying with the visual acuity of the eye, the more rapidly was the work performed. Those having normal or nearly normal eyes worked most rapidly under an intensity of artificial illumination of between 8 and 10 foot-candles. Those with eye defects showed less fatigue when working under higher intensities of illumination than when working under lower intensities.

"It is believed that the installation of the proper illumination would result in a large pecuniary saving to the post office, would also tend to reduce eye fatigue and defects resulting therefrom, and would conserve the eyesight of the employees.

### PRESENT SYSTEM SHOULD BE CHANGED

"The present illumination in the post offices should be changed. There should be installed in the general workrooms and offices systems of totally inclosing units, of the diffusing or light-directing type, giving a general intensity when first installed of 10 foot-candles everywhere on a horizontal working plane 45 in. above the floor. All local lighting should be done away with.

"The lighting unit to be installed in the general workrooms of the post office should be of such quality of glass and of such shape and size that its surface brightness at any point would not exceed 2.5 cp. per square inch when used with an incandescent lamp or other source of light emitting 3,100 lumens. This unit should have an output of at least 80 per cent of that of the clear lamp and a spherical distribution of its candlepower such that at least 8 per cent of the light emitted by the clear lamp would be emitted by the unit through the zone from 0 deg. to 30 deg., at least 28 per cent from 0 deg. to 60 deg., at least 48 per cent from 0 deg. to 90 deg., and at least 25 per cent from 90 deg. to 180 deg.

"The lighting unit for the offices of the post office should be of such quality of glass and of such shape and size that its surface brightness at any point would not exceed 2 cp. per square inch when used with an incandescent lamp or other source of light emitting 3,100 lumens. This unit should have an output of at least 80 per cent of that of the clear lamp and a spherical distribution of its candlepower such that at least 8 per cent of the light emitted by the clear lamp would be emitted by the unit through the zone from 0 deg. to 30 deg., at least 23 per cent from 0 deg. to 60 deg., at

least 43 per cent from 0 deg. to 90 deg., and at least 35 per cent from 90 deg. to 180 deg.

"Both the units for the general workrooms and the offices should be such in number and so spaced that the brightness of the units measured in lumens per square foot would not be more than one hundred times as great as the intensity of the illumination, measured in foot-candles, produced by them on a horizontal plane 45 in. above the floor.

"In order to obtain the recommended intensity of illumination of 10 foot-candles on the working plane it would be necessary to use about 2 watts per square foot of floor area in the general workrooms of the post office. The best spacing and mounting height of these lamps and the best size of lamps to use will depend on the height of the ceiling and the height of the working plane.

"The relation of the separation cases, tables and desks to the lights should be such that no shadows fall upon the working plane. In order to accomplish this result, where it is necessary to move the lighting fixtures, detachable fixtures may be used.

"In the case of the illumination of separation cases the relation of the separation cases to the lights should be such that the centers of the units would be 1 ft. in front of the plane of the vertical face of the pigeonholes.

"Care of the lighting should be placed in the hands of one man, who should be responsible for the upkeep and care of the units. He should make a daily round of the building and replace all burnt-out lamps and broken fixtures. He should cause the lighting units to be cleaned once a week, or as often as is necessary to keep them clean. He should see that the walls and ceilings are kept in good condition, so as to serve as good reflecting surfaces for the light. He should make measurements once a month with a foot-candle meter, in order to see that the uniformity and constancy of the illumination are maintained.

All the lights of a work area should be on one switch, and this switch should be under the control of a foreman, so that one light could not be turned on to the exclusion of the others.

### REQUIREMENTS OF ILLUMINATION FOR POST-OFFICE WORK

"In practically all post-office work there are two working planes, the primary plane being approximately horizontal, the secondary being vertical. Most of the eyework involves either reading or writing and thus pertains to a single surface in contrast to work requiring use of depth, such as machine work, millinery or tailoring. This is true of both vertical and horizontal planes. The height of the horizontal working plane, usually 45 in. above the floor, varies somewhat as the mail passes through the hands of the worker, while the distance of the vertical plane from the eye remains nearly the same, being the surface of the separation cases.

"There are many different colors and combinations of colors among the mail matter, although black ink on a light or white surface predominates. There are many combinations, however, which are distinctly difficult to read, handicapping the worker and straining his eyes. Such combinations are a dark background with an ink of the same color but slightly lighter shade, and colors which do not give any great contrast, such as black on blue, brown on buff, purple on violet, and red on red. The envelopes coming from central Europe are nearly all colored. To read the addresses on the foreign mail and to distinguish the marking on foreign stamps a particularly good light is required. In the money-order and registry departments the Post Office Department uses blue and red cards and blanks, which must be handled in large numbers by employees and which are difficult to read and tiring to the eyes. Frequently glossy-surfaced envelopes are used, and in recent years window envelopes, which render the reading of addresses less easy. Names and addresses are often difficult to read. This is particularly true of wrappers for newspapers and magazines, of longhand addresses and of foreign mail. These conditions require great concentration of vision.

"Some kinds of work require more light than others. For instance, clerks require more light than laborers. The 'American Standard Code of Lighting' gives 5 to 10 foot-candles as necessary for the former and 2 to 5 foot-candles for the latter. The eye work done in the post office can be for the most part classed with the eye work of other office workers and in some parts is as difficult as that for which the 'American Standard Code of Lighting' recommends 10 to 20 foot-candles and above. Since the general level of artificial illumination is rapidly rising in this country, it is impossible to say what the best illumination for post-office work will ultimately be found to be, but it is probable that it will be found to be higher than that indicated at the present time.

### GENERAL LEVEL OF ILLUMINATION INCREASING

"That the general level of illumination is rapidly increasing is shown by reference to figures given in the textbooks and lighting codes published during the last ten years. For instance, Bell, in 'The Art of Illumination,' published in 1912, says: 'All classes of clerical and office work can be performed easily under an illumination of 3 to 4 foot-candles,' and in 'Light and Its Use and Misuse, a Primer of Illumination,' prepared under the direction of the Illuminating Engineering Society, published during the same year, it is stated that 'ordinary reading, writing, or work on white or light-colored material, can comfortably be carried on by most people with an illumination of 2 to 3 foot-candles.' Clewell, in 'Factory Lighting,' published in 1913, gives 3 foot-candles as a good working intensity for office lighting. In 'Principles of Interior Illumination,' 1917, Cravath, Harrison and Pierce give 3 to 7 foot-candles as desirable illumination for office work, and Croft in the same year, in 'Practical Electric Illumination,' recommended 4 foot-candles for office work. The 'Code of Lighting for Factories, Mills, and Other Work Places,' published by the United States Public Health Service in 1919, recommends 4 to 8 foot-candles for office work. In the 'American Standard Code of Lighting,' published in 1922, this recommendation is advanced to 5 to 10 foot-candles. The recommendations of the state codes of lighting, beginning with the Pennsylvania code in 1916, show that much higher standards have prevailed during the last six years, and they also show a tendency toward a still higher level. For instance, Wisconsin in 1917 recommended 3.5 to 6 foot-candles, and in 1921, 4 to 15 foot-candles, for office work. The 'Code of Lighting for School Buildings,' prepared by the Illuminating Engineering Society in 1918, recommended 3.5 to 6 foot-candles for class and study rooms, with a minimum of 3 foot-candles, whereas the 'School Lighting Code' of the State of Wisconsin for 1921 rec-

ommended 8 foot-candles and higher, with a minimum of 5 foot-candles, for the same class of work.

"The recommendations of the state codes, arranged chronologically, are given in the table.

"One cause for the increase in the intensity of illumination recommended for various eye occupations may be that the great progress made in the manufacture and design of lighting units, globes and reflectors has made it possible to have higher intensities of illumination without increased brightness of the source, so that lamps of high wattage can now be inclosed in opal or other diffusing globes without causing objectionable glare from the high brightness of the surface of the units. Almost as important as sufficient illumination is the reduction of glare. Intensity of illumination and glare may be considered as the two elements of the subject, and one is almost as fundamental as the other.

### Glare and Surface Brightness

"Glare is caused by intrusion of non-useful light on the retina of the eye. No matter how well illuminated the objects on the working plane may be, clear vision of them may be destroyed by bright images of foreign objects in the field of vision.

"Glare may be produced by bright sources of light in the field of vision, by a large source of light close to the eye, by a light lying within a small angle from the object looked at, by a light standing out against a dark background, by exposing the eye to a source of light over a long period of time, and by light reflected into the eye from polished surfaces or glossy paper.

"The elements of glare are, then: (1) The brightness of the object producing it; (2) the angle of glare, or the angle that the line joining the eye to the object being looked at makes with the line joining the eye to the object producing the glare; (3) the distance from the eye to the object producing the glare; (4) the extent of the surface of the object producing the glare; (5) the contrast of the brightness of the surface of the object producing the glare with the brightness of the surface being looked at; (6) the time of exposure of the eye to the object producing glare.

### General Versus Local Lighting

"A distinction must be drawn between general and local lighting. In general lighting the units are so placed as to distance apart and height above the working plane and are of such power that they give an even distribution of the required illumination, 8 foot-candles, for example, all over the working plane. Local lighting is produced by single units so placed that they produce illumination only over small areas; they are illustrated by desk lights and bracket lights over separation cases. Good practice today indicates that local lighting should never be used as a regular thing, but only temporarily in emergencies. General lighting gives a higher illumination for the same number of watts used and is therefore more economical. This is due to the fact that a small number of high-wattage lamps are used rather than a large number of low-wattage lamps. High-wattage lamps produce more light per watt than low-wattage lamps.

"Since a marked increase in speed and accuracy in the work of the post office was found when the illumination was raised to 8 foot-candles, it was deemed desirable to calculate the decrease in the cost of labor and the increase in the cost of lighting and to balance one against the other to find out if any pecuniary saving would be effected by increasing the intensity of lighting in the office at which the survey was made, and if so what this would amount to.

"The actual power consumed in this post office for lighting during the calendar year 1921 was 1,113,320 kw.-hr. The cost of this power, based upon the minimum rate per kilowatt-hour under the contract with the lighting company, was, for the calendar year 1921, $26,334. The cost of replacing lamps under the present system during the year was $6,587, which makes a total cost of $32,921.

"With the above-mentioned consumption the mean illumination in this post office was 3.6 foot-candles. To find out what the consumption of power would be if this illumination were raised to 10 foot-candles, the present consumption must be multiplied by the factor 2.25. This factor is less than that required to multiply the present illumination of 3.6 foot-candles in order to obtain 10 foot-candles, because the total number of outlets is supposed to remain the same, while the illumination from a lamp increases more rapidly than does its wattage.

"The increased wattage required on this basis would bring the consumption to 2,438,080 kw.-hr., at a cost of $57,670, and the cost of replacing lamps to $14,820, a total annual cost of $72,490. The increase in the cost for the higher intensity of illumination is therefore the difference between $72,490 and the present cost of $32,921, or about $39,500.

ILLUMINATION FOR OFFICE WORK RECOMMENDED IN THE STATE CODES OF LIGHTING

| Year and State | Intensities in Foot-Candles — Good Practice | Intensities in Foot-Candles — Minimum |
|---|---|---|
| 1916—Pennsylvania | 4.0- 8.0 | 3.0 |
| 1917—Wisconsin | 3.5- 6.0 | 2.75 |
| 1918—New Jersey | 4.0- 8.0 | 3.0 |
| 1919—California | 4.0-12.0 | .. |
| 1919—Oregon | 4.0- 8.0 | 3.0 |
| 1920—Ohio | 4.0-12.0 | 3.0 |
| 1921—Wisconsin | 4.0-15.0 | 3.0 |
| 1922—Massachusetts | ... | 3.0 |

"The total pay roll for this post office for 1921 amounted to $6,746,039. Since investigation shows that only about one-half of the time of the workers is spent under artificial illumination, about one-half of this amount, or about $3,373,000, will represent the amount paid when working under artificial illumination.

"In the speed and accuracy tests it was found that for the letter separators there was an average increase in speed, or decrease in the times of separation, of at least 4.4 per cent when going from 3.6 to 8 foot-candles. Since all the work in the post office, with the exception of that done by the laborers, depends primarily upon the use of the eyes, and since in the post office for which these calculations are being made the laborers constitute less than 6 per cent of all the regular employees, it may be assumed that the same relative increase of speed would prevail in all the divisions of the post office under the same relative increase in illumination. If, then, 4.4 per cent is taken as the value of the percentage change in speed due to an increase of the illumination from 3.6 to 8 foot-candles, to find the pecuniary gain 4.4 per cent of $3,373,000 must be taken, which gives about $148,400.

"Deducting from this saving of $148,400 the increase in cost of energy and lamps, about $39,500, we get a net saving for this post office of about $109,000, or more than twice the increased cost of illumination."

GOVERNOR SMITH IN HIS MESSAGE CONTENDED THAT THE WATER POWER OF THE MIGHTY NIAGARA SHOULD NOT BE PUT TO USE OUTSIDE OF NEW YORK STATE

# New York State's Water Power

## Reasons Why It Must Not Be Isolated or Developed Individually—Advantages of Interstate Transmission and Superpower Systems Which Embrace Steam-Driven as Well as Water-Power Stations

By GEN. GUY E. TRIPP

*Chairman Westinghouse Electric & Manufacturing Company*

ONE of the most important things that can be done today to insure the increased prosperity of a people is to place within their reach a cheap, abundant and reliable supply of electric power. Both the Governor of New York and the Governor of Pennsylvania recognize this fact, and both have recently taken active steps to provide their respective states with such a supply from water power. But they are advocating diametrically opposite methods for accomplishing the desired result.

Governor Smith of New York wishes to develop New York's water powers for the exclusive benefit of New Yorkers and declares that any plan to divert this energy to territory outside of the state "must be resisted with all the power we can bring to our command."

Governor Pinchot of Pennsylvania, on the other hand, wishes to bring about a unified national development of water power, and it is clear that he even includes Canada in his plans.

Which is right? At first sight, Governor Smith's plan of reserving the resources of the state for the use of the state is quite likely to appeal much more strongly to New Yorkers than Governor Pinchot's; nevertheless, in spite of Governor Smith's undoubted desire to serve the state in the most effective manner, a very serious fallacy is involved in his recommendations.

Suppose Governor Smith, with the best intentions in the world, had advocated a plan for devoting New York's railroads solely for the service of New Yorkers and had proposed that all railroad connections with other states should be broken. Such a plan would be instantly greeted with indignant protest. Every one would realize that it would destroy our splendid interstate railway systems and, without conferring the slightest advantage upon New York, would be disastrous to the nation as a whole.

No less disastrous to both New York and the United States would be the isolation of New York's splendid water powers. Why this is true should become clear when certain facts about water power are understood.

### CONDITIONS OF WATER-POWER DEVELOPMENT

In the first place, few water powers are of much value if developed individually. The upper waters of the Hudson, for example, can generate over 500,000 hp. for the greater part of the year, but in dry seasons the flow (as shown by the last report of the New York Water Power Commission) may not be sufficient for the generation of 5,000 hp. Similar conditions apply to all other rivers in this part of the world, excepting only the Niagara and the St. Lawrence, which have an approximately uniform flow because they are fed from the enormous reservoirs of the Great Lakes. Consequently, in order to make power available all the year around, steam plants are almost always operated in conjunction with hydro-electric plants.

Second, electricity can be produced from two or more neighboring water powers more cheaply if the water-power plants are joined together in a single system and supplemented by a single large steam plant than if each water power is developed separately and is supplemented by a small steam plant. In the unified system the variations in the flow of the rivers tend to equalize each other, since no two rivers are at the lowest point

at exactly the same time, and less power from steam is needed; the large steam plant consumes less coal than the small plants to produce a given amount of power; the overhead expense is less, and there is less variation in the demand for power because of the increased diversity of use by the larger number of people served. All manufacturers understand that costs are much less with large-quantity production at a fairly uniform rate than they are with production in small quantities at an irregular rate. This condition is especially true in the manufacture of power.

Finally, when several water powers are interconnected, a considerable area of country is inclosed by the connecting transmission lines. By installing suitable service lines electric service can easily be given to the whole area thus inclosed. With the water powers developed separately, however, the energy from each is inevitably sent to the nearest congested district, and the regions not actually traversed by the transmission lines are unable to obtain electricity except at a prohibitive distribution cost.

### Ideal System for Northeastern States

Since the larger the system the cheaper it can produce power and the more people it can economically serve, the ideal system for the northeastern part of the United States is one that would extend from Maine to Ohio and from Canada to Maryland and would receive the energy of every water power in the area covered. With such a system, all of the now wasted water power in this district would be put to useful work, and though supplementary steam plants would still be necessary, they would be called upon for the minimum amount of power and, since they would be of the largest and most efficient type, they would consume fuel with the highest obtainable economy. Furthermore, they would be established in the coal regions and at points of convenient access along the coast, so that a large part of the railroad facilities now devoted for hauling coal would be released for other purposes. Both the power supplied by the water powers and the demand for electricity by the communities served would, of course, vary constantly, but the great network of transmission lines would act as an equalizing reservoir and would make up deficiencies at one point from surpluses at others.

### What New York Will Lose if She Isolates Her Water Power

If New York's water powers form an integral part of this great system, all of her people will be able to obtain electricity at the lowest possible cost; but if that state is determined to isolate herself electrically, she will prevent the creation of the system and will not only injure her own citizens but everybody else in this section of the country. She will not be able to use all of her water power for a long time to come, and she will therefore allow the excess to waste instead of developing it for the benefit of other states that need it badly. If, through a prolonged drought, fuel shortage or other causes, she experiences a temporary power famine, she will not be able to draw on the surpluses that may exist in other states. Since her water-power development will be incomplete, her transmission network will also be incomplete, and many of her citizens will be unable to get power.

Under the plan of state monopolization the chief sale of power will be to existing municipalities. These will tend to become more and more congested, and living conditions, especially in New York City, will g worse and worse. But with power properly and wi distributed the population will tend to spread out the more open country, and thus the deplorable t ency toward overpopulation of our cities may checked.

### Interstate System Makes More Power Availab

While an interstate power system takes power of a state, it in equal degree brings power into state. The most important of all water power northeastern America are not in New York at all. are in Canada and on the Canadian boundary. If York isolates her own power, she could not consist ask another commonwealth to supply her with po New York, therefore, would thus cut herself off this vast power supply which she and her neighbo states are certain to need urgently within a genera or two.

In a strictly technical sense, New York may the legal and moral right to monopolize her w powers. If so, the coal-producing states have an e right to monopolize their coal for the benefit of t citizens. If New York were to be deprived of coa of power generated by coal in the Pennsylvania fields, she would be badly off and would viole denounce such action as anti-social and anti-Ameri Yet her administration proposes to pursue a prec similar course with reference to water power.

Finally, if New York does devote all her water po to her own use, she will not be able to produce i cheaply as she could by co-operating with her ne bors, because she will sacrifice the advantages of la quantity production; she will not be able to secure full benefits arising from the co-ordination of w powers and steam plants, and she will not be abl obtain power generated in the Pennsylvania coal fi

### An Interconnected System Produces Cheape and More Reliable Power

"After eighteen years of study and work on problem," writes Governor Pinchot to Governor Sn "I have come confidently to expect the growth nation-wide interlocking power system. . . . freedom of commerce among the several states, unrestricted exchange across state lines of ser goods and resources, guaranteed by the Federal stitution, is the strongest man-made basis of the p perity of each state. This consideration applies only to energy riding in a coal car but equally to en flowing over a wire, whether the burning of fuel o falling of water was the source. Furthermore, r cheap power cannot be supplied to consumers u the burning of coal and the flowing of water contri their energy to a common reservoir for the com supply of industries, farms, homes and railroads. a system must transcend state lines and is likel become nation-wide."

Thus are the views of a statesman in agree with conclusions of the engineer. Back of both li one desire—to bring to the people of the United S and Canada the greatest possible prosperity. Ne state politics nor private interest must interfere the proper development of our water power. The v of our rivers is a resource of the nation; it mu utilized so as to benefit the nation as a whole, a will thus best benefit each state and each indiv citizen.

# Indiana Company Changes to 60 Cycles

## Indiana Service Corporation Shifts Both Railway and Commercial Service—Customers' Motors Changed on Second-Hand-Price Allowance Basis—Old Rotary Converters Altered for Use

SERVICE at 25 cycles to commercial consumers exists to a considerable extent in Indiana and Ohio. Its history began with the development of the interurban electric railways in those states, when 25-cycle rotary equipment was considered as the only kind that could be successfully used. The commercial service was developed along the railway lines where the establishment of 60-cycle service seemed economically impossible. With the development of 60-cycle railway equipment and the existing tendency which makes 25-cycle equipment special and higher in cost, the problem of changing to 60-cycle service everywhere is becoming a pressing one.

### Problem Facing Indiana Service Corporation

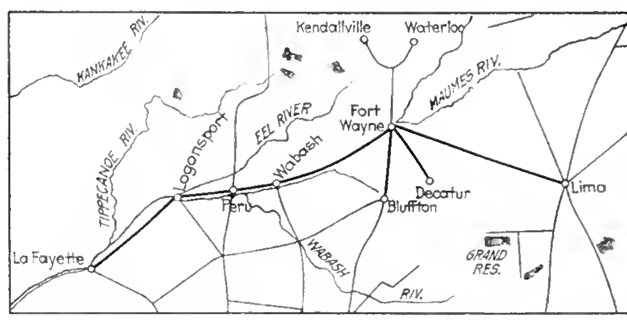
Until two years ago the west side of Fort Wayne was served from 25-cycle circuits. The interurban system of the Indiana Service Corporation centering at Fort Wayne comprises four lines, one to Lima, Ohio, one to Decatur, one to Bluffton and one to Lafayette, the three last named all in Indiana. The line to Decatur has always been served at 60 cycles, the Fort Wayne steam electric plant having been originally built with both 25-cycle and 60-cycle generators. The other three lines have been served at 25 cycles, and in addition to the railway service commercial service at 25 cycles developed on the Lafayette division in thirteen towns and some small scattering points and in five towns on the Bluffton division.

The present 25-cycle equipment in the Fort Wayne plant consists of two 1,500-kw. turbo-generators, and the 25-cycle territory has been served with 33-kv., three-phase delta-connected lines with No. 2 A. W. G. copper conductors. In addition to the service outlined power is supplied to the Fort Wayne & Northwestern Railway, running north of Fort Wayne, and to the Union Traction Company and Winona Interurban Railway electric lines through a connection at Peru, Ind. All three of these lines belong to other companies.

The important problems presented when it was decided to change all service to 60 cycles were: (1) On what basis should the motor equipment of commercial consumers, including motors in household service, be changed? (2) How could the railway equipment be changed with the least expense? and (3) What change, if any, would have to be made in transmission and distribution line equipment.

### Customer's Equipment Problem

Although the changes were decided on several years ago and the service on the west side of Fort Wayne and on the Bluffton division has been changed, it was obviously impossible to make a simultaneous change over the entire system. The changes on the Lafayette and Lima divisions are now under way. One community is taken at a time, and a thorough survey of the customer's equipment is made to determine the exact size, type and number of motors that must be changed. The second-hand value of the customers' motors is then ascertained and a standard offer made to each customer. For all motors over 1 hp. in size the consumer is asked to pay the difference between the second-hand value of the equipment and the price of the new 60-cycle equipment. In all cases of fractional-horsepower motors, such as those on washing machines and other household equipment, the company traded the new equipment for the old on an even basis. In all cases the offer has specified that the cost of installing the new and removing the old equipment shall be assumed by the company. It is interesting to note that so far almost no trouble has been met. Only three or four controversies have arisen, and these have not been serious. The existing condition in the manufacture of 25-cycle equipment, which places it on a non-standard basis and therefore makes it more expensive and difficult to obtain, is one of the arguments used in convincing consumers that the change is of benefit to them. Moreover, the opportunity afforded to improve the efficiency of old installations by the installation of equipment better suited to the work has played a part in bringing about acceptance of the proposal. It is believed that a frank, clear-cut statement of the reasons for the change, with patience and tact in telling the story, is the chief factor in persuading customers.



SYSTEM OF THE INDIANA SERVICE CORPORATION WHICH IS BEING MADE ALL 60-CYCLE

The railway lines except that to Decatur were constructed for 25-cycle service. Along the 25-cycle lines commercial service had grown up. The west side of Fort Wayne also originally had 25-cycle service. This service and that of the Bluffton division have been changed. Similar changes are now under way on the Lafayette and Lima divisions.

In making the actual change to 60-cycle service in any town all customers' equipment needing change is gone over thoroughly and complete plans for the replacement of each motor are made. These are carried out so far that the only work to be done at the final change-over is the shifting of motors. Foundations and foundation bolts for the new motor are placed and the pulleys needed to obtain the proper speeds are on hand with the new motors, which are set close to the old equipment ready for the shift. At the time of the actual change-over the important motors are changed over-night so that industrial concerns are not hampered by shutdowns. The old starting compensators are utilized throughout, and so far no trouble has been experienced. A change in compensators in most cases would

have meant the added cost of compensators plus a much greater expense in rewiring, as disturbance of old wiring involves compliance with wiring ordinances that might reach far. The sizes of motors changed range up to 250 hp., though the largest number are small, 10-hp. and 15-hp. sizes predominating. The customers are fully warned of the change and the time at which it is to be made by newspaper, motion-picture and such other advertising means as are available. The customers with household appliances are warned that the changes will be made on certain days and are asked to arrange household work so that the motor equipment need not be used on those days. Approximately three or four days is needed for these changes.

The meter problem is handled by the installation of new meters. The old meters in most cases have been changed for 60-cycle use by the replacement of current and potential coils, though some of the older types could not be handled thus and had to be scrapped or traded to the manufacturers.

Distribution transformers required no shift at all, and there were no changes in either the service or transmission lines required. Naturally, some difficulties with special equipment were encountered, though no serious troubles developed. In one case it was necessary to replace the impellers in direct-driven centrifugal pumps at a water pumping station because the motor speed could not be matched closely enough in 60-cycle equipment. A number of merchandise establishments are equipped with coffee grinders, meat choppers and other like machines in which the motors are built into the equipment. By working with the manufacturers of the equipment it was possible to promote arrangements whereby new motor equipment was supplied by negotiation between the customer and the manufacturer without any participation by the central-station company. Another problem was that of the small battery charging rectifiers employed in garage work which use the two-element vacuum tube. Material was ordered to change these over. On one man's insistence that he could do no more than burn one up, a trial showed that the chargers apparently needed no changing, and they are now operating on 60 cycles without any modification and no indication of trouble.

### The Railway Problem

Obviously the rotary-converter equipment was unusable. These machines and their transformer equipment varied in size between 200 kw. and 450 kw. When the question whether the transformers could be used for the new rotary equipment was raised the various manufacturers said that it would be impossible to do so satisfactorily. The old rotaries were 25-cycle three-phase, with 33,000/370-volt step-down transformers. The new equipment is all 60-cycle, 500-kw., six-phase, requiring a transformer secondary voltage of approximately 445. The old transformers were partly of the shell and partly of the core type. After some experimenting it was found that one of the middle primary coils in the shell-type transformers could be cut out of circuit and left dead. This gave the proper ratio, maintained the balance of stresses due to magnetic forces and left the transformers with the four $2\frac{1}{2}$ per cent voltage regulation taps intact.

The same procedure was adopted with the core-type transformers, except that they were dismantled and an equal amount of primary winding was removed from each core leg. When reassembled wood spacing blocks were fitted in the space of the removed coils. Part of the transformers are of the type with external reactance and part have reactance built into the transformers. With the changes it was found that the reactances are approximately the same as would be supplied in new transformers to match the new rotaries. Though the windings are being operated at a higher voltage per turn than they were designed for, it has so far been impossible to discover any bad effects from the practice.

Of course, the transformers did not match the new rotary equipment as to capacities. This was disregarded as each substation has ample transformer equipment to handle present loads. When load developments necessitate or depreciation and other causes eliminate the old transformers, new equipment to match the rotaries will be purchased. Since new rotaries had to be purchased and one size could be adopted as a standard, it is felt that the operating and maintenance advantages of such standardization justified the course adopted and that economic and operating conditions could be safely left to care for the transformer situation in the future. As a matter of fact, the discrepancy in rotary and transformer capacities is not so wide as it would seem, since the transformers are designed on the old basis of rating and the rotaries are rated on the basis of present standards.

### Frequency Changers Would Not Save Expense

In considering the various methods of establishing 60-cycle service the obvious one of handling the railway circuits through frequency changers was investigated. The result showed that the costs of this method and of the one adopted were about equal, with the disadvantage against the frequency-changer method of loss of efficiency in conversion and an expensive change later as the old 25-cycle equipment reached its life limit.

In making the changes town by town the method on the Lafayette division is typical. An interconnection for 60-cycle service with another company exists at Lafayette, making it possible by opening the line disconnecting switches installed at each substation to operate one section of the transmission line at 60 cycles and the other at 25 cycles. A 500-kw. portable substation is used to handle the service at any substation temporarily while the new rotary and its control panel, which is purchased as a part of the new rotary equipment, is installed ready to cut into service. The portable substation is then moved to the next location.

In several instances service in small communities had been supplied at 2,300 volts through step-up transformers connected to the 370-volt rotary circuits. In these cases 33-kv. step-down lighting transformers are being installed. However, this has no bearing on the change to 60-cycle service. These things are merely incidents of by-gone practice which it is possible to change and put on a better basis.

In handling the railway signal systems the only changes found necessary were the substitution of new magnet coils for the old. Some question was raised as to whether more transmission insulator trouble would be experienced on the 60-cycle service. Just why the question should be raised is not understood, but there are no indications of such a result.

The service to the interconnected railway lines is being handled in the case of the Fort Wayne Northwestern Railway by a change to 60-cycle service along exactly the same lines by that company. In the handling of the changes for commercial service the details are

being worked out by the same man who is handling the changes on the Indiana Service Corporation system, where these dealings with consumers were all placed in the hands of one man with the necessary qualifications of technical knowledge, tact and patience. The question of handling the railway interconnection at Peru is not settled as it has not yet been reached.

One experience that has been satisfactory is the ability to dispose of the old motors. Other 25-cycle systems in the territory are expanding their commercial service, and the demand, particularly for the small sizes, has been good. Larger sizes have proved harder to sell, though so far, by success in selling the motors taken out, the expense of the changes has been kept to the cost of shifting equipment. In all there are about three thousand consumers involved in addition to the electric railway service, and the progress of the work so far done has been most gratifying.

# Major Changes in National Electrical Code

**Covering of Overhead Conductors and Separation of Meters Dropped—Solid Neutrals, 15-Amp. Fuses and Twelve Outlets per Circuit Allowed—Proximity of Radio and Power Circuits Included—Changes in Motor-Circuit Protection**

THE outcome of the final action of the electrical committee of the National Fire Protection Association on the proposed revisions of the National Electrical Code has been made available to the ELECTRICAL WORLD, in so far as the major changes are concerned, through the courtesy of Dana Pierce, chairman of the committee and vice-president of the Underwriters' Laboratories. The decisions were based on very careful considerations of written and oral discussions of the proposed changes received prior to and including the day of the public hearing in New York, namely, March 12. Owing to the fact that numerous changes in phraseology as well as actual requirements were made and because the entire code will be rearranged and reclassified, it is doubtful how soon printed copies of it will be available. However, the committee believes that the rearrangement of the code will greatly facilitate its use as a reference book and hence will justify the change.

### SOLID NEUTRALS BY PERMISSION

As reported last week in the ELECTRICAL WORLD, solid neutrals or ground circuits will be permitted on two-wire and three-wire branch circuits by permission of the inspection department.

That is, omission of the fuses in these conductors will be allowed by permission. Permission is required to assure that the system to which the branch circuit is attached is properly grounded and that an identified grounded conductor is carried throughout the installation.

The omission of the fuse in the grounded side of branch circuits, it is considered by the committee, should be a part of a more general method of wiring which includes also the grounding of secondary circuits in a thoroughly reliable and permanent manner and use in installations of an identified grounded wire throughout the building properly connected to all fittings. Proper grounding of circuits and the polarization of wiring is not universal by any means yet, and it is felt that the omission of the fuse in the neutral should, therefore, be allowed at present only in places where the inspection department has determined that the grounding and polarization is provided. It is expected that such permission will be given by inspection departments for systems, cities and parts of cities where this program is known to have been actually carried out, rather than by a separate ruling on new buildings in every case.

### 15-AMP. FUSES FOR 125-VOLT CIRCUITS

Instead of placing a maximum limit of 10 amp. on 125-volt branch-circuit fuses, the code now allows 15 amp. for ordinary branch circuits and 40 amp. for circuits designed for "Mogul" sockets. The old limitation of 660 watts per branch circuit has been abolished. Not more than twelve outlets are now allowed on two-wire branch and each side of three-wire circulits except by special permission. Also, eight "Mogul" sockets may be connected per branch circuit if fused for 40 amp. In this case the sockets, receptacles and fixtures shall be wired with conductors not smaller than No. 12, and the taps from branch circuit wires to the point of suspension of the outlets, receptacles or fixtures shall not exceed 18 in. Where heating appliances requiring 660 watts or less are to be used they may be connected to ordinary branch circuits, but if more than 660 watts is required special circuits must be installed and the fuses shall not exceed 15 amp. rating.

### DELETE METER SEPARATION AND OVERHEAD-WIRE COVERING

To electric service companies the dropping of the proposed ruling on separation of gas and electric meters and the proposed requirement of a protective covering for overhead circuits operating at voltages up to 5,000 will no doubt be a great relief.

In view of the extensive discussion on the proposed requirement that outlet boxes be at least 1½ in. deep, the committee revised the ruling to the effect that it is recommended that side-wall and partition outlets in concealed new-building work now under construction be provided with a depth approximating 1½ in. This space is considered essential to accomodate splices.

### CHANGES IN MOTOR-CIRCUIT PROTECTION

Protection of motor circuits underwent considerable revision. For example, motors may be grouped on one set of fuses if the demand on the circuit does not exceed 15 amp. or 1,200 watts. Fuses are no longer required in addition to circuit breakers on switchboards, or where subject to competent supervision, or where next back on the line there is protective apparatus set

## Some of the Important 1923 Amendments to the National Electrical Code

**Rule 8c. Motors.** *Amend to read:* Motors may be grouped under the protection of a single set of fuses provided the rated capacity of the fuses does not exceed 15 amp. and the total wattage of the circuit does not exceed 1,200, or provided each motor is protected by thermal cut-outs. The number and size of the motors grouped with thermal cut-out protection need be limited only by the maximum size of the fuses with which the thermal cut-outs can be safely used, and each thermal cut-out must be marked to indicate the size of this fuse.

Fuses are not required in addition to circuit breakers (a) on main switchboards, (b) where otherwise subject to competent supervision, or (c) where next back on the line there are fuses rated or a circuit breaker set at not over 300 per cent of the motor nameplate rating, (d) for circuits above the capacity for which there are no standard fuses.

Where the motor-running protective device is shunted during the starting period the motor and the portions of the motor branch circuit between the motor and its running protective device are considered as being sufficiently protected during the starting period by the next overload protective device back on the line if the rating of this fuse or the setting of this circuit breaker is not over 300 per cent of the motor nameplate current rating.

### Size and Protection of Conductors of Motor Circuits

Conductors carrying the current of only one motor must have a carrying capacity of at least 110 per cent of the nameplate current rating of the motor, the actual size to be determined by the rating of the fuses or the setting of the circuit breaker protecting them.

Automatic overload protective devices may be omitted at the point where conductors carrying the current of only one motor are connected to the mains, provided their current-carrying capacity is at least one-third that of the mains, the length of the conductors between the mains and the motor protective devices is not greater than 15 ft. and they are suitably protected from mechanical injury.

**Rule 8f. Motor Switches.** *Amend to read:*

In places where combustible dust is thrown into suspension in the air in sufficient quantity to produce explosive mixtures, such as in flour mills, grain elevators, etc., or where it is impracticable to prevent dust or flying material collecting in dangerous quantities on or in motors, all motors shall be either of the totally inclosed type or shall be placed in separate dust-tight rooms or non-combustible housings. Such rooms or housings shall be effectively ventilated from a source of clean air.

**Rule 15Aj. Method of Grounding When Protective Grounding Is Required.** *Amend to read:*

Where the secondary system is grounded at the service, the equipment, metal raceway and the like may, with permission of the inspection department, be connected to the circuit grounding conductor but otherwise shall have a separate grounding conductor.

**Rule 15 Am. Switchboard Instruments.** *Add new section to read:*

Where meters and instruments are used with current and potential transformers, the cases of the meters and instruments may be connected to the secondary circuits of the current and potential transformers and grounded for the purpose of avoiding errors due to electrostatic action, in which case No. 12 B. & S. gage copper wire or larger shall be used for the grounding conductor.

**Rule 23d. Fuses for Branch Circuits.** *Amend to read:*

For the purpose of this section the terms "branch circuits" and "outlets" are defined as follows:

"Branch circuit" is that portion of a wiring system extending beyond the final set of fuses or circuit breakers protecting it, and at points on which current is taken to supply fixtures, lamps, heaters, motors and current-consuming devices generally; such points are designated as "outlets."

By special permission of the inspection department, two-wire branch circuits from systems having grounded neutral or one side grounded, and where the grounded conductor is identified and properly connected, may be protected by a fuse in the ungrounded wire, no fuse being placed in the grounded wire. Otherwise two-wire branch circuits shall be protected by a fuse in each wire.

Three-wire branch circuits may be run from direct-current or single-phase alternating-current systems having a grounded neutral, in which case the neutrals of the branch circuits shall not be fused. The neutrals of such circuits shall not be interconnected except at the center of distribution.

Branch circuits in general, and except as described below, shall be protected by fuses of no greater rated capacity than: 15 amp. at 125 volts or less, 10 amp. at 126 to 250 volts.

Fixture wire or flexible cord of No. 18 or No. 16 gage shall be considered as properly protected by 15-amp. fuses. Receptacles for attachment plugs (convenience outlets) are strongly recommended in order to facilitate the use of electrical appliances, which otherwise must be connected to sockets designed primarily only as lamp holders.

On a two-wire branch circuit and on either side of a three-wire branch circuit the number of outlets shall not exceed twelve except by special permission.

Branch circuits supplying only sockets or receptacles of the "Mogul" type shall have the wires protected by fuses having a rated capacity not greater than: 40 amp. at 125 volts or less, 20 amp. at 126 to 250 volts.

The number of "Mogul" sockets on a two-wire branch circuit and on either side of a three-wire branch circuit shall not exceed eight except by special permission.

Mogul sockets and receptacles and the fixtures with which they are used, shall be wired with conductors of not less than No. 12 B. & S. gage. Taps from circuit wires to the points of suspension of such sockets, receptacles and fixtures shall not be over 18 in. in length in order to be considered protected by fuses specified above.

**Rule 26a. Wires.** *Substitute for the first paragraph:*

For the conductor sizes No. 8 and smaller the neutral conductor on all three-wire circuits and one conductor on all two-wire circuits shall have continuous identifying marker readily distinguishing it from the other conductors.

**Rule 28. Interior Conduits.** *b. Amend to read:*

Concealed extensions from existing branch circuit outlets in buildings of fireproof construction, may be made by means of approved flexible or rigid conduit, not smaller than $\frac{5}{16}$ in., or other forms of metal raceways approved for the purpose, and fittings containing one No. 14 B. & S. gage rubber-covered wire. This conduit is not to run in concealed spaces but is to be laid on the face of the fireproofing and may be plastered over. Extensions of this kind shall be confined to the room or suite in which they originate.

**Rule 43. Electric Cranes.** *c. Switches and Cut-outs. 3. Amend to read:*

Where there is more than one motor on a crane, each motor with its leads must be separately protected by an automatic cut-out in accordance with No. 8c, except that where two motors operate a single hoist, carriage, truck or bridge and are controlled as a unit by one controller, the pair of motors with their leads may be protected by a single automatic cut-out. The cut-out should be located in the cab when there is one.

**Rule 47. Primary Wires.** *Amend to read:*

*b.* Air-break disconnectors shall be installed between oil switches which are used as service switches and the supply wires.

**Rule 86a. Radio Equipment. For Receiving Stations Only.** *Amend to read:*

Antennas outside of buildings shall be kept well away from all electric light and power wires for any circuit of more than 600 volts and from railway, trolley or feeder wires so as to avoid the possibility of contact between the antennas and such wires under accidental conditions.

Antennas where placed in proximity to electric light and power wires of less than 600 volts shall be constructed and installed in strong and durable manner and shall be located and provided with suitable clearances so as to prevent accidental contact with such wires by sagging.

at not more than 300 per cent of the motor nameplate rating. The actual size of motor-circuit conductors shall be determined by the setting of the protective apparatus. In places where combustible dust is thrown into suspension in sufficient quantity to produce explosive mixtures, totally inclosed motors shall hereafter be required or the motors shall be set in dust-tight housings. Another important change is that automatic overload protection may be omitted at the point where conductors carrying the current of only one motor are connected to the mains, provided the motor circuit has a carrying capacity at least one-third of the mains and provided the length of the conductors between the tap-in point and the motor productive device is not greater than 15 ft.

### PROXIMITY OF RADIO AND POWER CIRCUITS

So far as the relation between radio antennas and power circuits is concerned, the requirement now is that antennas shall be kept away from lines energized at 600 volts and over. Below this voltage ample clearance and rugged construction must be provided.

Other changes were made in the code which will have their effect on all branches of the electrical industry. For instance, where the secondary system is grounded at the service, equipment grounds and the like may be connected to the circuit-grounding conductor by permission from the inspection department.

### IDENTIFIED GROUND CONDUCTOR REQUIRED

All the grounding conductors of circuits consisting of No. 8 and smaller conductors must have an identifying color (white or natural gray). This applies to the neutral of three-wire circuits and the grounded conductors of two-wire circuits.

No circuit fused for more than 20 amp. is allowed in a metal raceway, and circuits of different systems are not permitted in the same conduit.

According to the revised code, one-conductor or two-conductor armored cable is allowed for concealed extensions in fireproof buildings if laid on the fireproofing. This also applies to one-conductor flexible conduit not smaller than $\frac{5}{16}$ in. in diameter.

For decorative and theater lighting circuits the outlets connected per branch circuit cannot demand more than 15 amp.

A new requirement of particular significance to industrial concerns is the one that requires separate automatic cut-outs for each motor on cranes where more than one motor is required. An exception is made where two motors operate a single hoist carriage, truck or bridge and are controlled as a unit by one controller.

### AIR-BREAK DISCONNECT FOR PRIMARY SERVICE

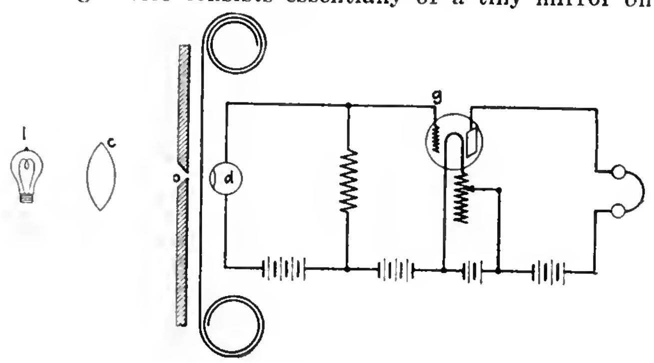
Where oil switches are used as service switches on connections taken from primary wires, an air-break disconnector is required between the oil switch and the supply. Switching and motor rooms for 601-volt to 5,000-volt circuits must be closed to unqualified persons.

The major addition to the code so far as fuses are concerned is the requirement of identifying marking to indicate their rating. For 250-volt fuses of 15 amp. or less a navy-blue label is required, and for fuses of greater rating green labels are required. Plug fuses of less than 15 amp. shall be distinguished by a hexagonal window or recess in the top, and the label shall also be hexagonal.

## Some Details of the "Pallophotophone"

MORE details of the "pallophotophone," a device for recording and reproducing sound to which reference was made a short time ago in the ELECTRICAL WORLD, are given below and by the accompanying illustrations.

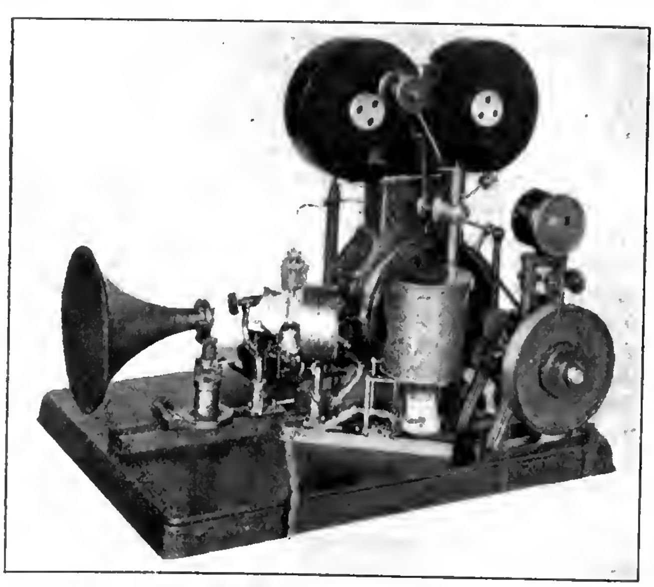
There are two distinct devices in this apparatus, one for recording sound and one for reproducing the sound, either of which may be used independently. The recording device consists essentially of a tiny mirror on



CIRCUIT DIAGRAM SHOWING APPARATUS USED

which is reflected a beam of light. This mirror is attached to a delicately adjusted vibrating diaphragm, and when sound waves cause the diaphragm to vibrate, the mirror oscillates and the ray of light causes the projection of corresponding oscillations upon a strip of photographic film which passes in front of the mirror in a continuous motion. The film is then developed in the usual way and when developed shows a succession of delicate dark markings which constitute the sound record.

In the reproducing system the operation of the apparatus is as follows: A photo-electric cell and two batteries are connected in circuit with the grid of a vacuum tube. Any change in the resistance of the cell will produce a corresponding change in the electromotive force impressed on the grid. When the film carrying the sound record passes between the cell and the light, the varying degrees of light which it permits to fall on the cell cause a varying amount of electron emission



VIEW OF ASSEMBLED UNIT OF "PALLOPHOTOPHONE"

in the cell and thereby create a potential difference in the grid circuit. Current then flows in that circuit in amounts directly proportional to the intensities of the light admitted to the cell through the film and at frequencies corresponding to the frequency of the vibrations recorded on the film. The remainder of the circuit and its action are similar to those of the standard radio transmitting equipment.

# Electric Plowing in Europe

### Implement Is Pulled by Caterpillar Tractor with Induction Motor Drive—Automatic Flexible Feeder of Bare Aluminum Feature of Swedish Invention

PLOWING the fields is by far the hardest labor on a farm and that which requires the greatest amount of energy per unit area, with the exception, perhaps, of water-spray irrigation. Much attention, therefore, has been devoted to the problem of designing an electric plowing outfit which will be cheap enough in actual use to compete with teams and gasoline tractors. Central-station men in rural districts naturally look upon the electric plow with much favor, since its adoption will mean a substantial increase in energy consumption per acre of the electrified area, resulting in a correspondingly better utilization of existing distribution plants. According to a survey recently made in Germany, the average yearly consumption for rural purposes is about 8.5 kw.-hr. per acre of cultivated electrified area. Electric plowing of a field takes from 16 kw.-hr. to 32 kw.-hr. per acre. Thus if 80 per cent of the ground is electrically plowed each year, the adoption of electric plowing will increase the energy consumption per unit area to from two and a half to four times its present value.

In Europe there are three radically different electric plowing systems in use, which may be called, for simplicity, the French, German and Swedish systems. The French system, which has been developed, among others, by the Compagnie d'Entreprises Electromécanique in Paris, makes use of a heavy motor wagon with two hoist drums, the plow being pulled back and forth by means of a long steel cable wound alternately on the two drums. The cable surrounds the field and has to be guided by two fixed drums and two other drums attached to anchoring wagons, one on each side of the field.

In the German system, which is due to the Siemens-Schuckert Company, two separate motor wagons are employed, each, with an 80-hp. motor. These wagons move stepwise one on each side of the field and pull the plow back and forth between them. An alternative scheme is to use only one motor wagon, the other one being replaced by an anchoring car with a free drum to double the cable back.

In the Swedish system Captain E. Grafström of Stockholm made a radical departure from former practice in electric plowing in designing his "electrotank," a caterpillar electric tractor which may be used not only for plowing but also for pulling harvesting machines and similar implements, and which therefore seems better than the cable-pull systems suited to compete with the gasoline tractor.

The "electrotank" equipment consists of two main parts, a stationary cable car and the tractor proper, connected to the car by an aërial feeder. The tractor is provided with a steering wheel and gear shift and is driven by a 15-hp., 500-volt, three-phase induction motor working on a worm reduction gear. The tractor weighs about 400 lb. and has a reverse and two normal speeds of about 131 ft. and 196 ft. per minute. The main feature of the invention is the aërial feeder, which consists of a flexible band of aluminum, built like a rope ladder, the three phases being carried parallel to each other in the same horizontal plane and kept apart by insulating spacers. The feeder is attached to a mast 20 ft. high on the tank and runs from there through free air to a similar mast on the cable car. The tractor mast is of steel tubing and the feeder band is joined to its top by a slip-ring arrangement permitting the tractor to move freely about its own axis. The mast on the cable car is hollow and made of wood, the bare feeder being carried down through the mast to an insulating drum, where it is rolled up in such a way that each phase coils concentrically on itself and no short circuits can occur. The drum automatically pays out the flexible feeder as the tank moves away from the cable car, the feeder always being kept taut by an automatic regulating device built on the slip-clutch principle and driven by a small induction motor. Some difficulties

GERMAN, FRENCH AND SWEDISH ELECTRIC PLOWING SYSTEMS HAVE BEEN DEVELOPED IN EUROPE

at first were encountered due to breaking of the aluminum band, but with a more recent design of regulator the tank may safely take ditches and other obstacles.

The length of the feeder is 738 ft. and the "electrotank" thus is free to move within a circle with a diameter of 1,476 ft. Furrows 1,300 ft. long thus may be made in one stroke and a field of about 37 acres may be plowed without moving the cable car.

The energy consumption is about 17 kw.-hr. per acre, while the power varies from 12 hp. to 30 hp. The energy cost, therefore is about 50 cents an acre, at the rate of 3 cents per kilowatt-hour, and thus compares favorably with the cost of other plowing systems.

## Letters from Our Readers

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

### National Aspects of Water-Power Development

*To the Editors of the* ELECTRICAL WORLD:

I note the letter of Francis A. J. FitzGerald on the "National Aspects of Niagara Falls Development," in which he criticises some of the statements made in my article on the "Pit River Power and Transmission Problem," printed in the ELECTRICAL WORLD for Jan. 27. Mr. FitzGerald should not have quoted incomplete sentences or statements.

I did not imply that there was no transmission of power from Niagara. I said: "To attempt to find a local demand for the *whole* of these large powers, as was done at Niagara, because in the early days of the electrical industry there were no transmission systems developed, is uneconomic and unsound for the industry and from a standpoint of national stability. For to be stable we should have the industries of the country diversified and spread out over the country as much as possible, building up the smaller communities as well as the large centers. At present places like Niagara, New York City, Boston, Philadelphia, Chicago and other places have much cheaper power than obtains in the smaller cities and towns. This does not make for a healthy growth of the states and nation. We need a transmission system which will take the power from the large producing centers to the smaller as well as the larger consumption centers and more nearly equalize power conditions in small and large cities."

Again I said: "It is not sound practice to allow *all* the water powers of Niagara to be used locally to the advantage of a few industries, but part of this power should be required to flow out into the smaller cities to help them prosper. Similarly, the water power of Muscle Shoals and other sites of great potentiality should not all be used locally to the advantage of a few industries, but a very large proportion of this power should find a market through the construction of transmission lines that will take it to available markets and build up present communities. In that way we will spread out the advantages of water power among more people, and this will in turn create a more favorable public opinion for the logical development of water power and transmission systems to meet the needs of the states and nation."

The real economic and political problem is given in the statement that there must be "created a more favorable public opinion for the logical development of water power." We cannot expect public opinion to favor the release of a reasonable amount of water for power at Niagara for local or other uses unless we get more people to know that they will get some direct benefits. It is a crime to have the waste going on at Niagara while we deplete our coal mines and talk about shortage of labor.

I believe the Niagara developments are a wonderful thing and that their local use was fully justified in the initial period of water-power developments, "because we had no transmission system developed." But if we are to get more water released for power for the use of industries at Niagara it seems inevitable that we must also take *part* of this power out to the smaller communities to get a more favorable public opinion. If it is wrong to give Henry Ford all the Muscle Shoals power to use locally, then it is also wrong to apply practically all the water powers at Niagara, St. Lawrence and other places to local use.

There can be no argument that the real solution of the power problem requires that it be cheaper to transmit energy electrically than to transport energy in the form of coal by rail. There can also be no argument that the transmission system must be commensurate with the large power units and stations. For the same reason that the size of the power units at Niagara and other places has increased ten times in the last ten or fifteen years the capacity of the transmission systems must be correspondingly enlarged. These are some of the economic reasons for the 220,000-volt transmission system.

If we apply reason to the water-power and transmission problems of the country, a plan can be worked out that will be a great benefit not only to the electrical industry but to the country as a whole. For the logical solution of the water-power and transmission problem will largely solve the coal and labor problems with benefit to all. F. G. BAUM.

San Francisco, Cal.

### Neglected "Safety First" Precautions

*To the Editors of the* ELECTRICAL WORLD:

We hear a great deal in these days of safety first and accident prevention campaigns, methods and systems, and they do much toward the end intended. It takes only the intelligence of a child to understand the danger of contact with 500-volt transmission lines, yet are these really the most dangerous features of the modern electric power plant? One does not think of any great danger from an ordinary 110-volt alternating-current lamp socket, nor from the composition of finishes for the handles of dusters or brooms, nor from the amount of conducting matter in paints used on ladders, insulating stools and other woodenware one sees daily in all power plants. To the danger from possible live lamp sockets I can testify from personal experience. While inspecting some apparatus on a shelf 10 ft. above the floor and holding a drop light inclosed in a wire guard in my right hand, in order to insure myself against a possible fall I grasped a cold 1½-in. steam pipe with my left hand. Instantly I found that my left hand had closed on the steam pipe with a death-like grip. I put forth my greatest possible effort to release my grip on the pipe, but it was utterly impossible to do so, and I realized the danger I was in. The thought flashed into my mind that the only thing to do was to let my body swing off the ladder, and this I did. I have no memory of what happened until I was

again on the floor standing on my feet with a severely sprained foot, considerable skin abrasion and a partly smashed ladder. I was still grasping the lamp just as I was holding it when the ground was formed. On investigation I found that a single strand of the flexible cord was in contact with the shell of the lamp socket, thereby energizing both socket and lamp guard with 110 volts to ground.

The accident related will indicate the care that should be taken when making the extension cords that are often used inside of boilers and penstocks and in so many places of low resistance to ground circuits. The use of portable lights tapped to the usual 550-volt railroad circuit lamp cluster should be absolutely forbidden as defective material or careless workmanship can easily result in injury or death. The finish on the handles of dusters and brooms often causes severe shock from moderate potentials. This, too, I can attest from experience. I advocate that all extension lights be made so as to preclude the possibility of a socket and guard becoming alive; that the quality of the finish on broom and duster and switch-hook handles and fuse tongs be of very high resistance. Paint on any of these articles must be forbidden in place of insulating varnish.

Assistant Chief Electrician.
Cos Cob Power Plant, N. Y., N. H. & H. R.R.

## Automatic Operation of Hydro-Electric Plants

*To the Editor of the* ELECTRICAL WORLD:

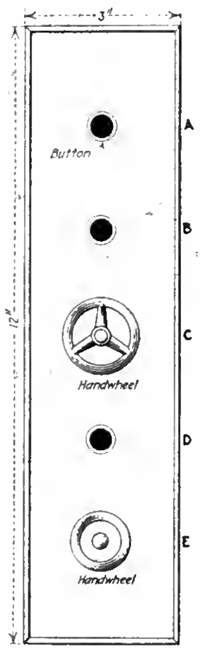
The discussion in the ELECTRICAL WORLD regarding automatic hydro-electric plants has been very interesting. In the early spring of 1922 I had a good opportunity to make studies into the merits of automatic hydro-electric plants while installing and wiring the automatic equipment at the Breakwater plant of the Peninsular Power Company. This station consists of two 2,000-kva. generators and is entirely automatic. Since it has been in operation there never has been any doubt regarding its superior operating and economic features.

The automatic hydro plants are a distinct success, and the only limitation at present is that they will not attend to load dispatcher's requirements regarding line switching. To my knowledge there is not any safe method of opening a line switch automatically so that linemen can work on the line affected.

It has been proved to be economical to save the wages and housing cost of from two to three operators by operating small plants automatically. It will therefore be equally economical to design or change over larger plants to semi-automatic control, thereby dispensing with several operators. With semi-automatic control one switchboard operator could operate a large station where hand control might require an assistant switchboard operator and perhaps a governor man and a pump man to assist him.

The engineer who has the opportunity to design a large hydro-electric station at this time is indeed fortunate as manufacturers are able to supply him with governors and automatic electrical equipment which will safeguard his installation better than any operator could with manual control. Besides that, the starting and stopping of main units is far more satisfactory with automatic equipment. A 400,000-kw. plant consisting of eight 50,000-kw. units could readily be controlled as far as operation is concerned by one man. The controls of eight 50,000-kw. generators could be mounted on a panel 1 ft. high and 2 ft. wide. This panel would be mounted on the operator's desk. I would suggest that the generators each have separate excitation and an individual Tirrill voltage regulator. Assuming that there are times when a long high-voltage transmission line must be energized by building up the voltage gradually, this should also be taken care of automatically.

The diagram shows a 1-ft. x 3-in. panel section allotted to the control of one 50,000-kw. unit. Pulling the button *A* would start a generator and would stop it after the generator had backed off its load. It may be well to explain that there never would be any need of an operator stopping a generator quickly, as the generator is protected in every possible way by automatic devices, taking all emergency operations away from the operator.



If it is desired to build the voltage up on a long high-voltage line, the operator will pull the *B* button as well as the *A* button, and the excitation of the generator will be so controlled automatically that this function will be taken care of quickly and in a neater way than with hand control. Perhaps it might be advisable to eliminate the *B* control and let the generator "think for itself" by connecting the secondary leads of a line or bus potential transformer so that when this potential transformer is energized the generator will get on the line in the usual way, while if the potential transformer is dead the generator will bring the voltage up properly for energizing a high-voltage line. *C* is a voltage-adjusting rheostat for the Tirrill regulator. By means of these eight rheostats the alternating-current voltage can be kept at the desired value and the power factor as it affects the generators regulated. *D* is to control the load of the generators with the ordinary paralleling motor if desired. It could also be arranged to prevent turning load control over to float switches or a distant load dispatcher. *E* controls a gate-opening-limit stop on the governor, thus enabling the operator to carry any set load. Perhaps it would be a good idea to have a remotely controlled indicator in view of the operator to show the governor-gate opening at all times. The line-control panels in a station of this kind should also be grouped very compactly, and instead of standardizing on one size of the meters they should have dials only large enough to get the desired results. For instance, a 50,000-kw. meter should have a large dial while a power factor or exciter voltmeter would need only a very small dial.

I made the statement that one man could handle the operation of a station of this size or even larger. There would, however, be maintenance and cleaning to be attended to which would require other help, depending on local conditions. In selecting the size of a crew in a plant of this kind the number of men needed for maintenance would compare closely with the number needed in the same plant if it were hand-operated.

I predict that the steam station will also be controlled in a similar manner in the future. Bringing a large steam turbine up to speed and on the line automatically is not going to be too complicated a problem for engineers to solve, and when it is solved the method will be far superior to manual operation.

Peninsular Power Company.
Iron Mountain, Mich.

# Central Station and Industrial Practice

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Relay as Ground Detector for D.C. Control Bus

WHERE lamps as ground indicators are installed on direct-current control buses very annoying operating troubles are often encountered. Consequently the New York & Queens Electric Light & Power Company has done away with these lamp ground detectors and substituted for them a differential relay, the use of which has so far proved to be very satisfactory.

In order to be sure whether or not the direct-current system was free from accidental grounds, it was formerly the practice to install lamps on the direct-current bus, as shown in Fig. 1. When neither side of the bus was grounded, the lamps burned at half the direct-current bus voltage, but when either side became grounded the lamp on the opposite side burned with full voltage while on the grounded side the lamp was extinguished. With the lamp ground detector on the bus, it was found that transformer banks or feeders would often trip out without apparent cause. The operator would reclose the switches twice, but they would trip out immediately, and the operator would then leave the circuit off. The lamp ground detector would then show the direct-current system to be free from grounds. However, when the control wiring of the circuit which had tripped out was tested it would be found to be grounded, and after the removal of the ground the circuit would function properly with no further trouble.

The trouble was found to be due to a ground occurring on the control wiring between the "CO" relays and the "HG" relays, which were used to separate the relay trip leads on the oil-circuit-breaker circuits. Fig. 1 schematically shows the control connections on a typical feeder circuit. The wiring would accidentally become grounded say between points *A* and *B*. This would mean that the negative bus would be grounded through the "HG" relay on the particular oil switch that was closed at the time. The current taken by the lamp and "HG" relay in series between the grounded side and the ungrounded side of the bus was sufficient to cause the "HG" relay to operate and trip the breaker.

In order to avoid trouble of this sort, for which the lamp ground detectors were more or less responsible, they were removed and an entirely new system was installed for the detection of grounds on the direct

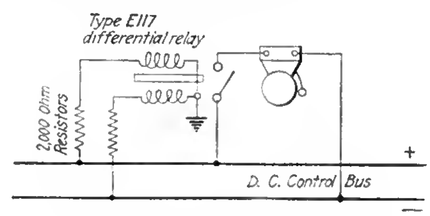

FIG. 2—DIFFERENTIAL RELAY AS GROUND DETECTOR

current bus, as shown in Fig. 2. A type E-117 Western Electric differentially wound telegraph relay, which operates on a few milliamperes, was installed with 2,000 ohms resistance in each side and with the middle point of the winding solidly grounded. In addition to operation on a current of such small magnitude that no other equipment would be affected, this relay is equipped with contacts that may be connected to ring a bell, light a lamp on the operator's desk or give any other desirable indication of trouble. In our substations a 110-volt bell is used.

This system has been in operation for over two years and has been found to be entirely reliable and satisfactory. It is now installed as part of the standard equipment on the direct-current buses for the operation of oil circuit breakers.

Long Island City, N. Y.

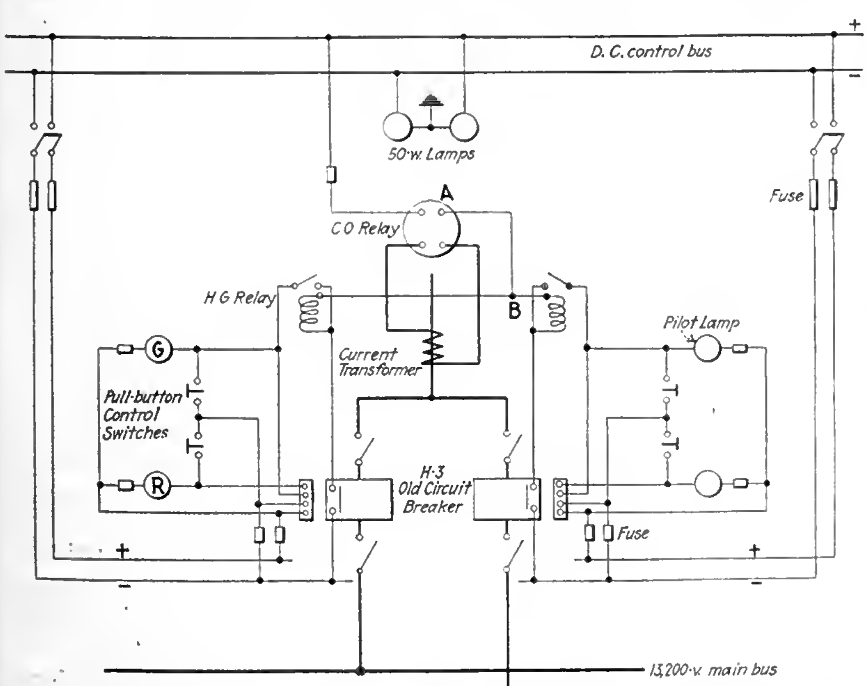

FIG. 1—GROUNDING OF CONTROL WIRE BETWEEN RELAYS CAUSES CIRCUIT TO OPEN

## Respiratory Protection in Street Manholes

WORKERS in street manholes for telephone and electric power conduits often encounter irrespirable atmospheres due to leakage of artificial or natural gas, sewer gas or gases caused by electrolysis. Inquiries received by the Bureau of Mines and

conferences between members of the bureau and engineers who have to deal with manholes have disclosed the need at times of respiratory protection for workers in manholes. It is planned by the bureau to obtain samples of contaminated air from manholes and to test various masks in them. Recommendations for protection of workers in manholes will be published. This experimental work is being conducted at the Pittsburgh (Pa.) experiment station of the bureau.

New York, N. Y.

## Starting Rotary Converters from the A.C. Side

ON ROTARY converters equipped with brush-lifting devices all brushes except the pilot brushes should be lifted from the commutator. If the brushes are left down, short-circuit currents occur in the coils undergoing commutation, resulting in severe sparking when this current is interrupted and in the burning of the commutator and brushes. Starting switches are provided to impress less than the normal voltage across the alternating-current end of the machine as the current must be limited to a safe value.

Proper polarity is essential as reversed polarity would cause the machine to act as a short circuit to a bus already energized. Therefore, when the machine has reached maximum speed with the switch in the starting position, the shunt-field switch is closed when the voltmeter needle swings in the positive direction. Sometimes it is impossible to make a machine build up in the proper direction by means of the reversing switch. In this event, when running on the starting side, the oil switch should be opened for a few seconds and closed again. Opening the switch for the proper period will cause the armature to slip one pole space from its original position. Opening it for too long or too short a period will cause the armature to slip two poles, or none, either of which conditions leaves the polarity as before. Consequently, if the first attempt to reverse the polarity by this method is not successful, it should be tried again with a longer or shorter period of opening the oil circuit breakers.

If it is attempted to operate compound-wound machines in parallel without equalizing connections, one machine will take all the load and also feed back into the others and operate them as motors. Equalizer buses and switches are provided to cause proper division of the load current among the series fields, thereby overcoming this tendency.

These general instructions for operating rotary converters with the following definite instructions as to each successive step to take in starting are part of the operating code of the Philadelphia Electric Company:

1. If the machine has a brush-lifting mechanism, see that the direct-current brushes are raised and that only the pilot brushes remain on the commutator. Otherwise all the brushes must remain down.
2. If a main field break-up and reversing switch is provided, see that this switch is left open. If a field reversing switch only is provided, see that this switch is left closed in the running position, unless the switch is provided with a field discharge resistance, in which case it should be left open.
3. See that the booster-field switch is open.
4. Cut in all the main-field resistance and connect the voltmeter by plug, dial switch or other means to the machine being started.
5. If the transformer bank supplying the rotary converter is air-cooled by an individual motor-driven fan, start the fan; if air-cooled from a common air duct, open the transformer dampers; if water-cooled, turn on the cooling water. Where fans are supplied for cooling the rotary converter, start these fans.
6. Throw the alternating-current starting switch to the starting position.
7. If necessary to obtain the voltmeter reading, close the negative bus switch.
8. Close the oil switch, at the same time observing the alternating-current ammeter.
9. If the main-field switch, as stated in Rule 2 above, is left open, observe the direct-current voltmeter, and when the needle swings in a positive direction, close the main-field switch in the running position. Where the main-field switch is left closed, note the direction in which the voltmeter needle comes to rest.

In either case, if the field builds up in the reverse direction, as indicated by a negative voltmeter reading, throw the main-field switch to the reverse position; then, when the voltmeter needle swings slightly to the positive side of the scale, throw the main-field switch to the running position.

If a machine does not build up in the right direction after several trials of the above method, proceed as follows: With the starting switch in the starting position, open the oil switch and close it again in a few seconds. In case the voltage does not build up correctly, repeat the above operation, keeping the oil switch open for a slightly shorter or longer period of time as may be found necessary.

10. Close the booster-field switch.
11. Throw the alternating-current starting switch to the running position.
12. Lower the main brushes on the commutator.
13. Close the equalizer and series-field switches. (The series-field switch is provided only on machines having a shunt around the series field on the main-field spool.)
14. Close the neutral switch (on three-wire converters).
15. Where knife switches are provided in series with circuit breakers, close the circuit breakers.
16. Adjust the direct-current voltage to that of the bus.
17. Close the negative bus switch, if it has not been closed under Rule 7.
18. Close the positive bus switch.
19. Load the converter by field adjustment.

## Hot Stoker Rams

HOT upper stoker rams may be caused either by the burning out of the ram-box cap in the front wall or by an obstruction over the ram, preventing coal from feeding. In either case the coal in the hopper will become ignited, which will heat the rams and ram boxes. Hot lower rams are caused by clinker formation between the tuyères or by insufficient feeding of coal by the rams, which allows the hot coal to come in contact with the lower rams. Typical instructions for taking care of hot stoker rams are part of the operating code of the Philadelphia Electric Company and are given below:

### HOT UPPER RAMS

1. Break the arch over the ram with air agitators or by hand, or should there be an obstruction, dig the coal out of the hopper and remove it.
2. Feed green coal to the ram.

### HOT LOWER RAMS CAUSED BY FIRE BEING TOO THIN

1. Increase the stoker speed.
2. Reduce the drafts when possible.
3. Put the long stroke on the ram.

### HOT LOWER RAMS CAUSED BY CLINKERS

1. Put the long stroke on the ram, alternating with the normal stroke to break up the clinker.
2. Put U-pins on the end of the lower-ram driving bar outside of the driving link to draw the ram further out of the fire.
3. Dislodge the clinker with bars from the side doors.
4. Reduce the air blast, if it is possible to hold steam.
5. If this fails, take the boiler off the line and remove the clinker.

# Regulations Proposed for Installation of Pulverized-Fuel Systems

REGULATIONS covering the installation of pulverized-fuel systems have been prepared by a subcommittee of the National Fire Protection Association and approved by the main committee on dust explosion hazards and will be recommended to the annual meeting of the association for tentative adoption at Chicago on May 8-10, 1923.

Any one interested in these regulations and desiring to suggest additions or changes should communicate prior to the May meeting with David J. Price, United States Bureau of Chemistry, Washington, D. C.

Some of the major requirements as set forth in the regulations may be found in the accompanying tabulation. The general regulations for Class A and Class B systems relate to location and construction of apparatus, ventilation and dust collection, static dust, crusher and pulverizer, magnetic separators, dust collectors, driers and fire protection. Mechanical details such as piping, joints, valves, storage and furnace bins, screw conveyors, etc., are specified in the regulations for each of the various types.

An instruction card emphasizing precautions to observe in operating pulverized-fuel plants must be posted in a conspicuous place in the pulverizing plant, the boiler plant and in buildings where pulverized fuel is used. Among the major precautions to be included on this card are:

The use of shavings or other similar light combustible materials for starting fires in drier furnace is prohibited.

In Class B systems, if the fuel supply line becomes clogged, the furnace shall be immediately cut off and the secondary air stopped. When the obstruction has been cleared and before starting the fan a thorough examination shall be made to insure the removal of smoldering particles of fuel.

## Some Regulations Covering Installation and Operation of Pulverized Fuel Equipment to Be Voted On May 8-10, 1923

*Class A.*—Indirect, or those in which the fuel is intimately mixed with air only at the point or points where used and involving storage bins at points of consumption.

*Class B.*—Direct, or those in which the pulverized fuel is fed to a fan by which it is blown as a combustible mixture through large pipe to furnaces or other points of combustion. In the case of circulating systems of this class the unused fuel is returned to the initial point to again be blown through the line.

*Unit System.*—Those in which the fuel is pulverized at or near the point or points of use and delivered directly from the pulverizer into the furnace by means of fan or blower, which may be an integral part of the apparatus, the air being admitted in the apparatus or in conjunction with the fuel.

### General Regulations

*Class A and Class B Systems*

*Location.* — The processes of crushing, drying and pulverizing fuel shall be accomplished in a separate building used for no other purposes.

*Construction.*—In order to prevent accumulations of dust, the design of the building shall be such and the structural members so shaped and assembled as to present the least possible extent of surface on which dust can lodge. In order that the venting of explosions may be more readily facilitated, a portion of the exterior walls equal to not less than 10 per cent of the combined area of the inclosing walls shall be of glass, provided that when in a building with other processes not more than 40 per cent of the aggregate area of the exterior walls shall be of such material.

*Ventilation and Dust Collection.*—The atmosphere of the room shall be kept as free as possible from suspended or floating dust by means of approved dust-collecting systems, the collection of dust to take place as near the point of origin as possible.

*Static Dust.*—Portable tanks containing compressed air may be used provided that no electrical equipment is operated inside the pulverizing room in connection therewith.

*Magnetic Separator.*—A magnetic separator shall be provided for each system employing pulverizing mills and installed between the crusher and the drier.

*Driers.*—The drier and drier furnace shall be separated from other equipment in the pulverizer house by means of incombustible partitions constructed of material having a fire resistance of not less than one hour based upon the standard specifications for fire tests and materials of construction. Pulverized coal exceeding a temperature of 150 deg. F. shall not be stored in any bin.

### Class A Systems

*Storage and Furnace Bins.*—Storage and furnace bins shall be located as far from furnaces as is consistent with operating requirements. Bins . . . shall be so shaped that no material will be left in the corners under normal emptying operation of the bin. All bins shall be equipped with a reliable gaging device so that the quantity of fuel in the bin may be readily determined without exposing contents.

*Screw Conveyors.*—Systems using screw conveyors for handling pulverized fuel shall be arranged with driving power applied at the discharge end. In no plant shall coal-storage bins, conveying machinery or fuel-pipe lines be used as supports for electric lighting or power lines other than those installed in conduit. Machinery and all other parts comprising the crushing, drying, pulverizing and conveying system shall be electrically grounded in an effective manner.

### Class B Systems

*Blowers.*—The primary blower shall be operated and maintained at a rate producing a primary air pressure higher than that of the secondary or booster. Motor circuits for primary blower and booster fan shall be protected by the same circuit-breaker switch or other protective device, so that the stopping of either will cause the simultaneous stopping of the other.

### Unit Systems

*Pulverizer.*—Power for operation of the pulverizer shall be controlled remotely at a readily accessible location and at the mill.

*Magnetic Separator.*—A magnetic separator shall be provided for each system.

*Vent.* — A pressure-relief vent discharging to the outside air shall be provided in the discharge of every pulverizer, having discharge pipe greater than 4 in. in diameter and exceeding 20 ft. in length. All pulverizers shall be constructed as dust-tight as practicable and so operated as to avoid emission of dust.

All stationary lights shall be protected with vapor-proof globes and wire guards. Only daylight or hand flashlamps shall be used when inspecting coal-storage bins and pulverizing and coal conveying apparatus. All conveying and distributing piping shall be inspected daily and any leaks that are found promptly repaired.

# Maintaining Dielectric Strength of Oil

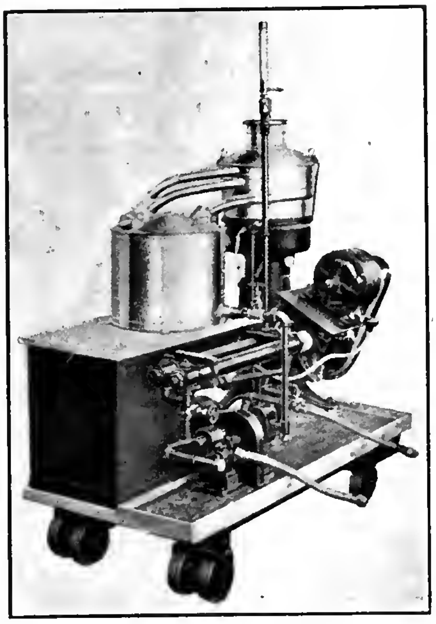
**Dehydration of Transformer Oil by Centrifugal Separator Is Proving Successful—Advantages Are Speed and Economy—Apparatus Can Also Be Used for Purifying Lubricating Oil**

EXPERIMENTS conducted during the past three years by one large central station company located in the East have demonstrated that the method of separation by centrifugal force can be successfully applied to the problem of removing water from transformer oil. As an illustration of a typical experiment in dehydration of transformer oil by a centrifugal separator the following test may be cited:

The transformer used was a 625-kva. unit, 2,300/440 volts, containing No. 12 transil oil. The temperature varied between 42 deg. and 48 deg. C. during the test. Approximately 530 gal. of oil were run through the separator, at a rate of 50 gal. to 150 gal. per hour. This speed could have been exceeded except for local conditions, a rate as high as 350 gal. an hour having been obtained in other tests. The dielectric strength of the oil was determined in each case by averaging the breakdown value obtained by testing five samples of oil in an oil test cup with ½-in. electrodes, 0.2 in. apart. The transformer was not in service at the time. The results of these tests are given in the accompanying table. In similar tests using a gap with 1-in. electrodes 0.1 in. apart dielectric strength as high as 32,000 volts have been obtained.

The apparatus now used for the dehydration of transformer oil is the result of the experiments made in the last three years. It consists of a motor-driven centrifugal separator, together with an electric driving motor, pumps, heater and oil tank, all mounted upon a movable platform. The fact that the apparatus is portable makes it possible to move it easily from one location in the power house to another or to roll it up a gangway onto a motor truck and carry it to various substations. At a large generating station it can remain permanently piped to all of the transformers and be used solely for their dehydration, but where there is not a sufficient number of units to keep one separator busy all the time the portability feature is a great asset.

The general practice in using this equipment is to draw off a sample of oil from the bottom of each transformer once a month and send it to the company's laboratory for testing. In this testing the 0.02-in. gap is habitually used because it is thought to give more reliable results. When the dielectric value of the sample of oil falls below 26,000 volts, the transformer is dehydrated by the centrifugal separator.



CENTRIFUGAL SEPARATOR PROVING SUCCESSFUL FOR PURIFYING OIL

The advantages which have been found to result from the use of the centrifugal separator for dehydrating transformer oil have been, primarily, increased speed and decreased cost. It was usually necessary with the blotter press to run the oil through the filter at least three times in order to purify it thoroughly. A transformer containing 2,400 gal. of oil would require forty-eight hours for dehydration by a medium-sized filter. Additional time would be required for changing blotters, taking apart and putting together the apparatus. On the other hand, a centrifugal separator could probably purify that quantity of oil in about twelve hours.

Not only is it possible for fewer men and fewer machines to do the work by the new method, but there is also the additional advantage that it is frequently possible to take a transformer out of service for a short period for dehydration, when it might be quite impossible to keep it out for many hours. The centrifugal separator therefore makes it feasible at times to dehydrate the oil completely under circumstances such that it could not be done by the slower filter press.

An illustration of the usefulness of speedy dehydration is furnished by the following experience with a transformer. It was discovered that a small pinhole leak in the copper tubing was allowing a minute quantity of water to mingle with the oil. Although the rate of leakage was low, nevertheless the dielectric value of the oil was rapidly reduced. It was most important that the transformer remain in service, so a portable centrifugal separator was brought over and set to work, while the transformer remained alive. After the oil had been dehydrated once the separator was left in place and tests were taken of the oil every hour. Whenever the dielectric value fell below 30,000 volts the purifiefir was set to work to restore it to the vicinity of 50,000 volts. In this way it was possible to keep the transformer in service for several days in spite of the leak at a time of peak demand when the loss of any apparatus would have been a serious inconvenience.

The existence of some solid matter in the transformer oil is clearly shown whenever the centrifugal separator is cleaned. A kind of sludge somewhat resembling vaseline is found to have gathered in the dirt pockets. This is probably composed

DIELECTRIC STRENGTH OF OIL IN A 625-KVA. TRANSFORMER UNDER TEST

| Time | Dielectric Strength of Oil at Intake, in Volts | Dielectric Strength of Oil at Outlet, in Volts |
|---|---|---|
| 8:15 a. m. | 14,000 | 21,000* |
| 8:30 a. m. | First oil repeated | 40,000 |
| 8:45 a. m. | 29,000 | 42,000 |
| 9:30 a. m. | 45,000 | 48,000 |
| 9:45 a. m. | 46,000 | † |
| 10:15 a. m. | 49,000 | † |
| 10:45 a. m. | 50,000 | † |
| 11:30 a. m. | 49,000 | † |
| 12:30 p. m. | 51,000 | † |

* This oil was not considered fit to be returned to the transformer and was put through separator again.

† No breakdown values obtained—dielectric strength above 52,000 volts, the capacity of the testing machine being 52,000 volts.

of metallic particles from the terminals, ingredients of the insulating varnish and so forth. The sludge accumulates so slowly, however, that it is possible to treat a transformer completely without its being necessary to stop the separator for cleaning. In this respect the centrifugal separator possesses a distinct advantage over the press filter, whose blotters have to be frequently renewed. The time required for taking apart the machine, cleaning out the dirt pockets and putting it together again is about forty-five minutes.

There are now many installations of this type of apparatus. The blotter-press method has not been altogether abandoned, because it is thought to be superior for removal of some foreign substances, such as the carbon in switch oils. Apparatus for both methods is therefore kept available, and its use is governed by the circumstance of a particular case.

Carbon has been successfully removed from switch oil by washing with soap, allowing the mixture to settle and then dehydrating the oil. By this process the dielectric value of the oil was brought back to standard and its clearness restored.

Where a unit must remain alive during dehydration there is a possibility that the first oil coming through the separator will not be fit to be returned, and if it should be poured back into the case, a breakdown might result. If, however, the oil in the transformer be of fairly high dielectric strength to begin with, or if the unit be dead during the dehydration, this danger will be avoided. It should then be possible to utilize the centrifugal separator readily and to accomplish improved speed and reduced costs in the removal of moisture from transformer oils. The fact that the same machine can be used after a slight change for the purpose of purifying lubricating oil brings it within the reach of smaller companies as well as those which use power on a large scale.

New York, N. Y. J. A. Miller, Jr.

## Restoring Flooded Generators to Service

The superintendent of construction and maintenance of a power company operating in the Southern States declares that he is not afraid to place back in service a generator which has been totally submerged in water. His confidence is based on experience with 6,600-volt generators which were submerged during the record flood of 1919. The coils were dried out by short-circuiting the phase leads and operating the generators at such speed and excitation as would maintain the rated allowable overload current in the windings. In general this drying-out process required about two weeks for each unit, whereas it would have required at least thirty days to rewind the generators if coils had been immediately available and a longer delay would have ensued if the coils had had to be shipped. Moreover, the cost of rewinding would have been about $25,000 per unit.

The length of time that the coils should be subjected to the drying current was determined by megger readings. No definite resistance was selected as the limiting value. Instead megger readings were taken from the start of the drying process. The curve plotted between time and resistance dropped off rapidly immediately after starting the process and then rose at a gradually decreasing rate until the resistant became constant. After the resistance had been constant for twenty-four hours the generator was considered ready for service.

## Pole Treatment Does Not Affect Conductivity

The question as to whether treated poles have less resistance than untreated poles and for that reason are a source of danger to linemen called upon to work on them has been a subject of considerable discussion, particularly where poles treated throughout their full length are used. A committee of the American Wood Preservers' Association reporting at its convention last January had the following to say on the subject:

*Poles.*—Your committee has decided that for all practical purposes the conductivity question as related to poles holds no interest for the following reasons:

1. The distribution engineer is concerned with insulator and cross-arm resistance, the pole resistance forming but a small fraction of the circuit to the ground.
2. Creosote and gas oil are the preservatives in general use for pole preservation, and the experimental data show that they increase resistivity of timber.
3. Steel poles and cross-arms are in common use on transmission lines.

We have asked the opinion of the N. E. L. A., and it agrees that pole conductivity does not enter seriously into transmission or distribution line construction.

*Tests on the Conductivity of Treated Wood.*—A number of investigators have studied this effect and have covered the subject thoroughly at least from a qualitative standpoint. J. T. Butterfield found that:

1. The resistance varies inversely with the amount of water present, the moisture being between the limits of 15 per cent and 50 per cent, also inversely with the length of the tie and with the temperature.
2. The resistance is lowest when with the grain and highest along the year rings or radial lines.
3. Treatment with a soluble salt does change the resistance of the tie and varies approximately inversely as the amount of salt present.
4. Creosote does not decrease the resistance.
5. All the data obtained tended to establish the view that the conductivity of wood is due to the presence of an electrolyte in the pores of the wood formed by an aqueous solution of the salts found in the natural timber or of salts artificially introduced.

Various tests and observations on ties made over a period running back to 1914 were submitted by the committee at this meeting.

The conclusions quoted are borne out in these data in that creosote-oil treatment in which pole users are interested does not decrease the natural wood resistance to the flow of electricity. Treatments utilizing soluble salts do change the resistance of any wooden poles.

# Central Station Business

**Advertising, Selling and Service Methods**
**Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences**

## Central-Station and Community Growth Inseparable

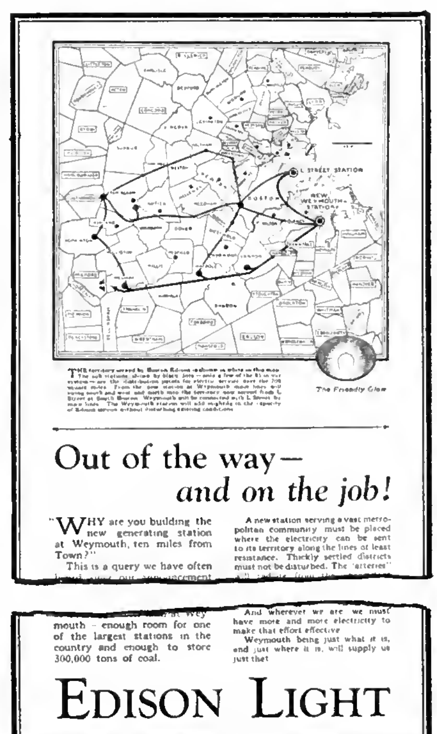
How the interests of an expanding community tie in with the development of a great central-station system is being shown in a group of advertisements now being published at Boston as planned by the Edison Electric Illuminating Company upon themes suggested by recent progress in its public service. The first three of these displays, which have been carried in daily suburban and financial newspapers in the company's territory of about 700 sq. miles on a regular time schedule, are reproduced herewith. The first draws a lesson from the peak-output record attained by the system on Dec. 21 last, the anniversary of the landing of the Pilgrims at Plymouth. The "set-up" emphasizes the two advances the date signified and calls attention to the fact that in meeting service requirements of a growing community the previous record output of the company was exceeded by 24 per cent. The contribution of the individual demand for service to the growth of company and community is featured.

A look ahead to the new Weymouth generating station is the basis of the second display, which emphasizes the need of foresight in anticipating the electrical growth of the community through arithmetical studies of load development and available facilities. The third insert goes a step farther and shows how the new 300,000-kw. station to be built at Weymouth will serve the entire metropolitan and suburban area of Greater Boston, with major tie lines to the principal substations and to the present L Street Station in Boston proper. The controlling factors in the decision to locate at Weymouth are set forth, and the diversity of interests served by the company from the farms of Millis to the tidewater industrial plants of Boston and Chelsea are outlined. Later advertisements will point out the importance of coal and the unity of interest in the development of both the community and company.

## Use of Electricity Reduces Number of Fires

Because of its increased application in the household and in industrial plants electricity is a potent factor in fire prevention. It has reduced the number of fires in Denver, Col., by more than 95 per cent in the last five years, according to a study and survey recently completed by Fire Chief Healy of the Denver City Fire Department. The increased demand for electricity for light, heat and power purposes has curtailed the actual number of conflagrations by at least 95 per cent, he believes. In short, not more than one fire in a thousand—probably even fewer—is caused by electricity when used properly.

Chief Healy grouped the few fires of electrical origin in the following three general classes: Fires over which ordinary precautions exert little control, such as conflagrations due to interference with transmission lines by falling trees, storms and the like, lightning and static electricity;



ADVERTISEMENTS CO-ORDINATING THE DEVELOPMENT OF COMMUNITY AND CENTRAL STATION

fires caused by abuse and carelessness in the use of electric appliances, and lastly, tampering with fuses and the use of other material than approved fuses; deterioration of installations and defective equipment.

The Denver Fire Department is gratified to report that few fires are actually attributed to defective equipment, he declared. The relative number due to such causes as neglect to disconnect flat-irons shows some tendency to increase.

Twenty-four conflagrations occurring in Denver over a period of two years which were attributed to electricity were shown by Chief Healy to be due to other causes entirely.

## Cooking Schools Stimulate Range Sales

TO PROMOTE the sale of electric ranges by educating the housewife in the use of this appliance the electrical interests of Portland, Ore., and Seattle, Tacoma and Spokane, Wash., recently joined daily newspapers to conduct electric cooking schools in each of these cities. Results proved highly satisfactory from the point of attendance, and the schools proved to be an excellent means of arousing interest in electric cooking.

The plan was first to sell the idea to a newspaper in each of the cities and have the school conducted under its auspices as the "*News-Tribune* Electrical Cooking School." The advertising and additional prestige gained amply repaid the newspaper for its support. Advertising by the power companies, electrical dealers and merchants whose products were used in the school, together with news items on electric cooking and concerning the school, created a strong appeal. A large hall was obtained in which merchants and manufacturers who participated in the advertising were allowed to maintain display booths and give out samples but not to solicit sales.

ATTENDANCE AT FOUR ELECTRIC COOKING SCHOOLS

| City | Population | No. Days School Was Conducted | Maximum Attendance | Average Attendance | Entries in Baking Contestt |
|---|---|---|---|---|---|
| Seattle | 315,000 | 5 | 1,500 | 1,000 | 987 |
| Spokane | 104,000 | 5 | 650 | 500 | 627 |
| Tacoma | 97,000 | 5 | 1,400 | 1,200 | 1,164 |
| *Portland | 258,000 | 5 | 600 | 600 | 620 |

* The largest hall available in Portland had a seating capacity of only 600. It is interesting to note tha Tacoma, with the smallest population of all of the four cities, had the largest attendance.

The success of such an undertaking depends largely upon the demonstrator, who should have a pleasing personality, be a good speaker, be familiar with every phase of the culinary art and be able to present the superior features of the electric range. For this purpose the services of Miss Bernice Lowen, home economist of the Edison Electric Appliance Company of Chicago, were secured.

Interest was maintained by holding a baking contest on the last day of each school, when prizes were awarded for the best loaf of bread, the best cake and the best pie entered. An electric range, a washing machine and a vacuum cleaner were given as first prizes for these entries. In addition to the first prize ten other prizes were awarded in each division. The entries were judged by the standard scale adopted by the bakers' association. All entries in the baking contest were accepted with the understanding that they would not be returned. These were sold instead, and in most cases the money was given to charity. A question box conducted by the demonstrator also proved valuable in spreading the story of electrical cooking.

The results of this method of educating the housewife to the superiority of the electric range are largely intangible, although a number of direct sales resulted. It is probable, however, that the full benefit will not be felt for many months. The interest created by the schools and the results which may be expected can best be judged from the accompanying attendance figures.

Power companies were quick to foresee the benefits of the cooking schools and lent their whole-hearted support. The free advertising which every one concerned received in the news columns of the papers sponsoring the schools would have cost thousands of dollars had a like amount of advertising space been bought. Much credit for the success of the undertaking is due Ray W. Turnball, Northwest district manager of the Edison Electric Appliance Company, who conducted the schools and was in charge of the entire program.

## Southern California Edison Sets New-Business Bogey

THE Southern California Edison Company has set up 100,000 hp. as the minimum amount of new business to be obtained during 1923. To

ONE SESSION OF THE TACOMA "NEWS-TRIBUNE" ELECTRICAL COOKING SCHOOL

reach this mark the company has sixty salesmen in the field actively engaged in obtaining lighting, heating, cooking and power business. An electric range and water-heater campaign has just been launched, and a quota of 1,500 ranges and 500 water heaters has been established. Present indications are that the added business will far exceed the mark established as 30,000 hp. in additional load has already been signed up.

The company has been enjoying a steady growth in business for some time past, the territory served containing a rapidly increasing population. Many new homes are in course of construction, new industries are being started, and established plants are increasing their facilities. This, together with the intensive development work which the salesmen are doing, has enabled the company during the first two months to sign up almost one-third of the year's minimum quota.

## Acquainting the Public with Utility Personnel

PERSONAL acquaintance of customers and the public with the members of a central-station organization is a valuable asset to the utility. To promote this idea the Utica (N. Y.) Gas & Electric Company recently displayed in its window an organization chart and photographs of its executives and its departmental groups which aroused much favorable comment in the community. As shown in the accompanying cut, the chart, which also is reproduced separately, was made the central feature of the display, and the line of authority and the functions of each individual or department were traced, beginning with the stockholder and terminating with the clerk or laborer.

Photographs of the executive officers, the "company council" made up of department heads, the superintendents' association, and group pictures of the staffs of the financial, operating, commercial, purchasing and suburban departments, together with a reproduction of an assemblage of more than a thousand people who attended the company picnic last summer, were included.

The chart and photographs, overtopped with a card bearing the caption "The Organization Back of Utica Gas & Electric Company's Service," were mounted on a background of copper-colored velvet, with a distinct headpiece or canopy of mulberry-colored velvet. Behind the canopy and concealed from the eye was an arrangement of several powerful incandescent lamps mounted in reflectors which illuminated the exhibit without glare, successfully overcoming the reflections and shadows from the buildings on the opposite side of the street. Incidentally, the Utica company retains the services of a professional window trimmer, who has charge of this work, and the displays are always of a high order.

Differently colored cords were arranged from the chart to the photographs of the executive departmental orzanizations, enabling the public to visualize the personnel of each department and its relation to the whole. It also made it possible for friends and acquaintances of individual employees to trace their connection with the company from this photograph back to the organization chart.

During the two weeks of the showing thousands of people inspected the exhibit and many complimentary remarks were passed on its originality and completeness. A number of business men and manufacturers expressed themselves as being so impressed with the display that they were going to prepare a similar one for their own companies.

The employees of the Utica company were thoroughly pleased by the public's interest, which was reflected to them through the medium of personal comment when they met with friends and acquaintances.

The company gained tremendously through the impression which it left with the individual, who visualized an organization of sufficient breadth

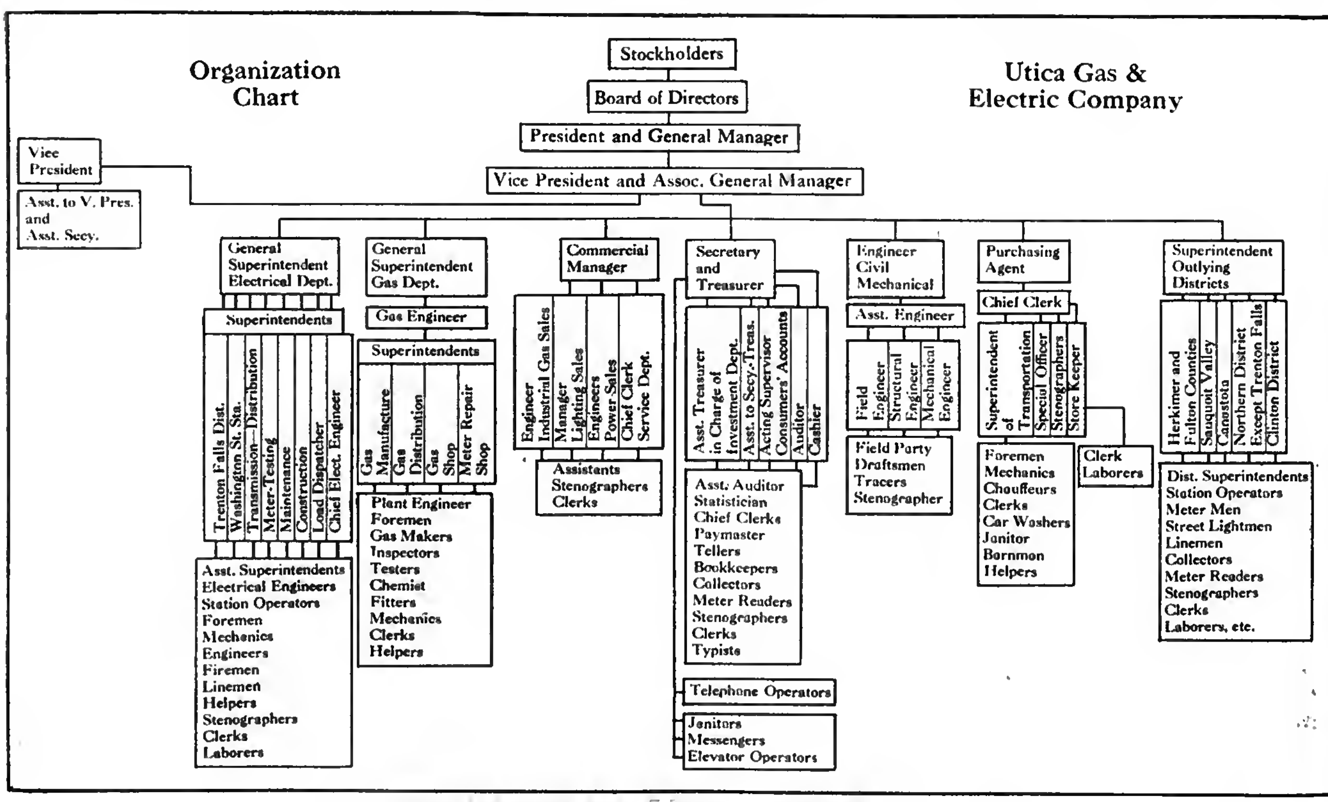


CHART SHOWING ORGANIZATION OF UTICA GAS & ELECTRIC COMPANY

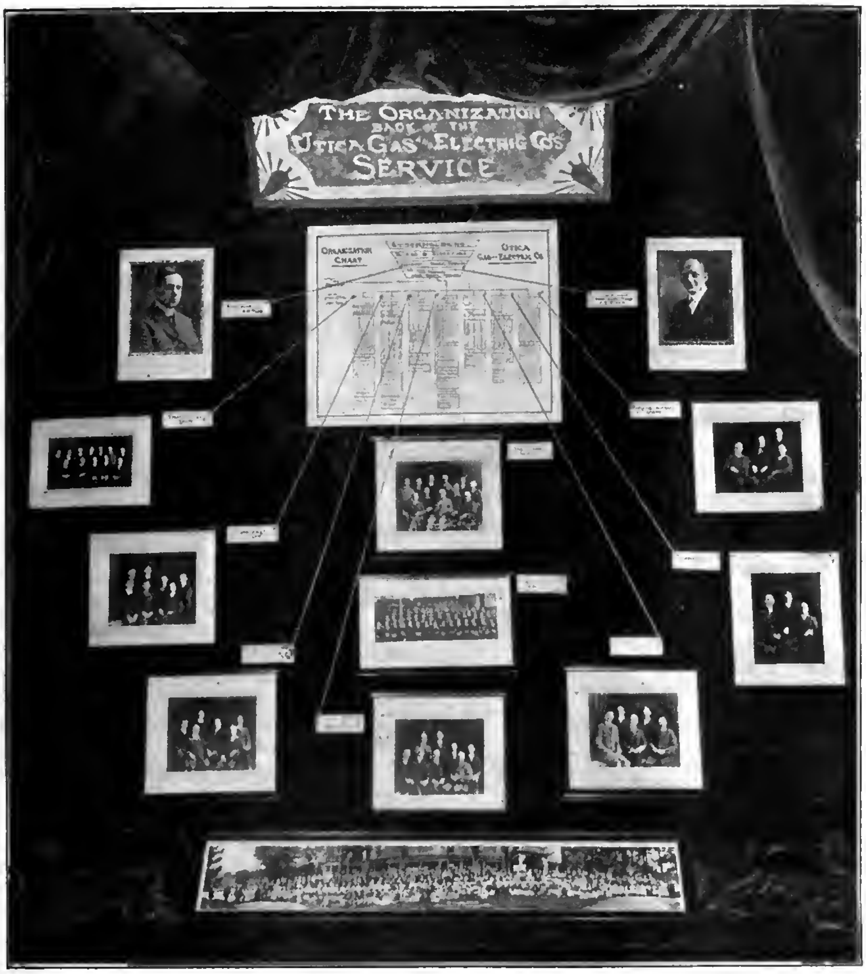

WINDOW DISPLAY SHOWS COMPANY'S PERSONNEL AND ORGANIZATION

and scope, subdivided into departments all of which were necessary to give him an adequate and reliable service indispensable in his daily, commercial and home life. It also gave the public a clearer conception of the size of the staff and the number of high-grade men required to direct and carry on the company's work.

## Maintaining a Permanent Sales Force

THE value of a permanent central-station selling organization was demonstrated in the number of new customers added to the lines of the Scranton (Pa.) Electric Company during the past year. In spite of the fact that the territory served by the company is the heart of the anthracite coal region which went through the depressing influence of a six months' coal strike, the company increased its electric customers from 39,000 to 44,000, or nearly 13 per cent.

E. W. Osborn, new-business manager of the Scranton Electric Company, states that this substantial increase under the prevailing conditions was possible because the company has developed a system of organizing and paying its sales force on a basis which encourages the salesmen to remain with the company. Nine salesmen are employed, who cover the entire territory, which is divided into districts. These salesmen handle all classes of business with the exception of industrial power, for which the company maintains a special department in charge of a power engineer.

Salesmen are paid on a salary plus commission basis, the salary starting at $80 per month and increasing $5 per month each year until it reaches $100. In addition to this, various commissions are paid. For a new residence customer 50 per cent of the first month's bill is paid as a commission and on store or commercial customers the commission is 25 per cent of the first month's bill. For successions—that is, where a customer moves out and another moves in—the commission is 10 per cent. On appliance sales a 5 per cent commission on the selling price up to $75 is allowed, and for appliances selling above that amount 3 per cent is allowed.

Under this method salesmen are able to earn from $2,000 to $3,000 annually, and it has enabled the company to build up a permanent sales force which accomplishes very satisfactory results from year to year. The company does not put on special selling campaigns, and appliances are sold on a cash or thirty-day basis, no deferred payment plans having been offered to customers.

## What Other Companies Are Doing

**Chicago, Ill.**—For furthering the sale of stock the Public Service Company of Northern Illinois has printed an attractive folder, on which appear views of two main generating plants together with a map of northern Illinois, showing the territory served. One of the plants pictured is the contemplated 250,000-kw. station at Waukegan. Charts are also shown giving the yearly increases in gross business since 1912.

**Minneapolis, Minn.**—During 1922 the Northern States Power Company wired 7,407 old houses, which is 203 more than were wired in 1921 and about ten times the number wired ten years ago. According to H. E. Young, sales manager of the company, Minneapolis, with a population of 400,000, now has 99,000 homes, of which 80,000 are equipped for electricity. However, many of the 19,000 unwired houses will never be wired because their dilapidated condition requires that they be torn down and replaced by modern structures. During the past ten years the number of old houses wired in Minneapolis was 42,285.

**Pawtucket, R. I.** — An electric home will be established in April, 1923, under the auspices of the Blackstone Valley Gas & Electric Company and the central station, jobber and dealer interests identified with the Rhode Island Electrical League.

**Brooklyn, N. Y.**—Nine hundred and thirty-four employees of the Brooklyn Edison Company are enrolled in the co-operative courses which the company and the Brooklyn Polytechnic Institute are conducting. These employees represent 21.5 per cent of the personnel of the company. Seventy-one per cent of the employees in the secretary's department are listed for instruction, 57 per cent of one engineering department and 44 per cent of the sales department.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Modern Management Methods in the Power Plant.*—B. ROBINSON.—The author discusses methods of analyzing power-plant performances and shows how to remedy defects in equipment. He also goes into detail on the importance of correct methods being used by the fireman.—*Industrial Management*, February, 1923.

*Flow of Water in Turbine-Draft Tube.*—O. MIYAGI.—An investigation of the water flow through draft tubes in which the water is conducted vertically downward to the tailrace. The author considers the energy lost by the frictional resistance in the draft tube and a sole plate, kinetic energy rejected at the end of the tube, the minimum loss and the determination of the best form of tube. He gives a numerical example illustrating his method.—*Technology Reports of the Tohoku Imperial University, Vol. III, No.* 1.

*Feed-Water Deaëration.*—The details of a closed feed-water system which has recently been designed and installed in a power plant by an English company for the complete deaëration of boiler-feed water is described. This system deaërates water only for supplying the boilers and economizers and their connections, and it is claimed that, as the operation is mechanical and automatic, the usual difficulties of adjustment have been entirely eliminated.—*Electrician*, Jan. 19, 1923.

## Generation, Control and Switching

*Safeguarding Workmen in Hydro-Electric Stations.*—RALPH BROWN.—Proper protection of workmen in power plants jeopardizes not only the lives of those who are responsible for plant maintenance and operation but also the equipment and the service rendered by the plant. The author gives the details of a plan that has been adopted with a high degree of satisfaction for the protection of workmen and increased operating efficiency. Although this system has been worked out especially for a large hydro-electric station, it could be easily modified to apply to steam plants.—*Power*, Feb. 20, 1923.

*Construction Details of Large Turbo-Generators*—E. ROTH.—An elaborate practical paper, written primarily for designers of large steam-turbine-driven generators, showing the great advance made in this branch of engineering during the last ten years. While in 1913 a 7,500-kva. machine was built to run at 1,500 r.p.m., a modern 20,000-kva. set operates at 3,000 r.p.m. Rotor construction has undergone a great variety of changes until now the distributed field winding upon a core, built up of a few heavy steel disks, seems to be generally used for the largest units. Rotor bands for holding the winding, previously made of bronze, are now made of an unmagnetic steel, which gives greater strength. The testing speed of French generators is 10 per cent above normal running speed. As yet no uniform system of ventilation has been adopted, the author showing nine diagrams of systems being used at present. Internal-temperature measurement with thermocouples is advocated as the most reliable method. In two-pole machines a momentary short-circuit current of thirty times normal may be expected. Very high testing voltages insure a reliable operation in service. The recently built 45,000-kva. generators for Gennevilliers, designed for 6,000 volts, have been submitted successfully to an 18,000-volt, one-minute test. The rotor windings should stand ten times normal voltage. A circumferential rotor speed of 130 m. per second seems to be about the limit for the present. The paper is illustrated with thirty-six valuable photographs.—*Revue Générale de l'Electricité*, Jan. 27, 1923.

## Transmission, Substations and Distribution

*Wave Form and Power Factor of Mercury-Arc Rectifiers.*—H. JUNGMICHL.—This highly mathematical paper develops the primary wave form for customary transformer connections of rectifiers and proves the results by means of oscillograms. The formulas hold true only for anode and direct-current circuits free of inductance and neglect stray fields of the transformer. The influence of the magnetizing current upon the wave form is shown on oscillograms. From the form of the primary current wave the author calculates the power factor, differentiating between the power factor in the winding and that of the feeder. It is also shown how the power factor may be calculated for two three-phase rectifiers operating in parallel six-phase connection.—*Elektrotechnik und Maschinenbau*, Jan. 21, 1923.

*Safe and Economical Ways of Hanging Electric Cables in Mine Shafts.*—F. W. CRAMER.—It is essential to efficiency that the electric cables in mines be properly designed and installed. If they are so planned and erected, they may be forgotten with safety, but if haphazard construction and the wrong cable is used, the feeder system may be a source of continuous trouble. One danger is the stretching of the copper cable, thereby lowering its capacity. Protecting lashing, cable clamps and cable supports which bend the cable into desired shapes are among the subjects discussed.—*Coal Age*, Feb. 15, 1923.

## Units, Measurements and Instruments

*Resistivity of Vitreous Materials.*—L. L. HOLLADAY.—The writer has investigated the resistivity of various types of glasses and has found that all results seemed to follow a general law which had not been heretofore generally recognized. Eleven specimens of glass were tested through a temperature range of 20 deg. to 500 deg. C., the results being plotted.—*Journal of the Franklin Institute*, February, 1923.

*Test Code for Instruments and Apparatus.*—The A. S. M. E. committee on power test codes is now engaged in the revision of the codes as issued in 1915. The preliminary drafts of Chapters 1 and 2 are given. These deal respectively with general considerations and with the accuracy of measuring instruments. The instruments and apparatus here considered are those used for measuring physical and chemical quantities in connection with tests of power equipment of various sorts.—*Mechanical Engineering*, February, 1923.

*Water Rheostat for* 30,000 *Volts.*—J. REYVAL.—A new 1,900 kva. single-phase generator was added to a French hydro-electric power house, and it was found desirable to make full-load tests of this new machine after it was installed. As the voltage of the generator was only 850, it would have been necessary to provide a rheostat heavy enough to carry as much as 1,500 amp., which was not deemed advisable. It was decided to connect the generator to its step-up transformer (850 volts to 30,000 volts) and to build a water rheostat to consume a current of some 40 amp. at about 30,000 volts. The electrodes were made of heavy steel plates 1 m. square, placed on insulators across the tailrace water, 2.4 m. apart, and were so arranged as to lower or raise them.—*Revue Générale de l'Electricité*, Jan. 20, 1923.

## Illumination

*Illuminating Engineering Society Papers.*—This issue of the *Transactions* contains three papers presented at the Swampscott convention last September. They are "The Cost of Daylight," by M. Luckiesh and L. L. Holladay; "Lighting for Motion-Picture Studios," by F. S. Mills, and "Flicker Photometry," by C. E. Ferree and G. Rand. Abstracts of the first two may be found in the convention report, ELECTRICAL WORLD, Oct. 7, 1922, page 760, and of the latter in the ELECTRICAL WORLD for Nov. 4, 1922, page 1004. The complete discussion of the three papers is also given in the *Transactions*.—*Transactions of the I. E. S.*, February, 1923.

*A Highly Developed Engine-house Lighting System.*—The wiring system of the New York Central engine house at Solvay, near Syracuse, N. Y., distributes power for motors, for motor-generator welding sets and for lighting purposes that really furnishes enough light and distributes it where it is needed without glare. A sufficient number of switches of a rugged type also make it convenient to burn only the lights that are needed. A description of the lighting system is given, illustrated with layout diagrams and photographs of typical points of interest, such as distribution panels, engine switches, control equipment for lighting equipment, etc.—*Railway Electrical Engineer*, February, 1923.

### Motors and Control

*Electricity as Applied to Mines.*—J. C. STEWART.—The types of generators, motors and cables used in collieries are explained and the factors governing the use of each particular type are discussed. A brief outline of the mechanical plant used in conjunction with motors is given, including pumps, haulages, coal cutters and winders.—*Journal of the Institution of (British) Electrical Engineers*, January, 1923.

*Electricity in the Chemical Industries.*—The use of electric drive in the chemical industry involves very severe operating conditions for the motors. Very often the atmospheric conditions are damp and corrosive, and with water, steam and gases present in abundance it sometimes appears that electric drive would involve heavy maintenance charges. However, modern electrical development has surmounted these inherent difficulties. Winding and control gear are protected, and with this provision it is possible to use apparatus that is otherwise standard. In discussing this problem, the author considers the handling of liquors, pumps, uses of compressed air, handling of solids, crushing operations, etc. —*Electrical News*, Feb. 1, 1923.

*Electrical Equipment for Grain Elevator.*—J. ANDREUCETTI.—When rebuilding the Chicago and Northwestern grain elevator at Chicago it was found necessary to renew a considerable portion of the electrical apparatus. The apparatus now consists of dust-proof distribution panel cabinets and vapor-proof lighting units with all new conduits and wiring run in such a manner as to insure reliable and safe operation. In this plant there are 190 motors in all, varying from 1.5 hp. to 140 hp., totaling 8,027 hp.—*Railway Electrical Engineer*, February, 1923.

### Heat Application and Material Handling

*Electric Heat Storage Stoves.*—Where electric energy is cheaply available during off-peak hours, as in most small-size hydro-electric plants, the use is suggested of electrically heated stoves, which are charged during the night hours and discharged during the day. Fully charged the oven reaches an outside temperature of about 100 deg. C. As a rule a complete cycle of eight hours' charging and sixteen hours' discharging is recommended. During this cycle the stove temperature will vary from 30 deg. to 100 deg., while the room will be kept between 20 deg. and 25 deg. C. The stoves are made in five sizes from 3-kw. to 15-kw. capacity, sufficient for rooms of 4,000 cu.m. to 100,000 cu.m. — *Siemens Zeitschrift*, January, 1923.

*Coal Handling by Suction.*—The installation of an interesting pneumatic coal-handling equipment has recently been completed at the Brimsdown (England) power station of the North Metropolitan Electric Power Supply Company. The equipment performs three distinct handling operations by means of one receiver and vacuum pump. Coal can be discharged from barges lying in an arm of the canal alongside the station at the rate of 50 tons per hour, or by means of a simple linking up of piping coal can be taken from the dumps and conveyed to the bunkers. Provision has been made for withdrawing coal from a tipping hopper below a railway track by operation of change-over valves adjacent to the receiver. A description, illustrated by diagrams, is given of this installation. —*Electrical Times*, Feb. 15, 1923.

### Traction

*Electrification of the Hungarian Railways.*—L. VEREBELY.—The planned electrification of 1,385 km. of the railroads of Hungary is expected to result in a 60 per cent coal saving over present conditions. No definite system has, as yet, been decided upon, but an agreement has been reached between the Hungarian government and the Hungarian firm of Ganz to test one of the latter's split-phase locomotives on part of a main road. The locomotive will be properly equipped for a thorough test of one year. The overhead wire of the test stretch of 15 km. carries 50-cycle, 15,000-volt, single-phase current, from which is fed a phase converter on the engine delivering 420-volt to 750-volt, three-phase current to the locomotive motors. On the locomotive, installed at half height, are two motors of 1,360 hp. each, with a double winding on both the stator and the rotor, giving four economical speeds. Triangular connecting rods transmit the motor power over a blind shaft to the five driving axles. The locomotive weighs complete 72 tons.—*Elektrotechnik und Maschinenbau*, Jan. 14, 1923.

*Electric Haulage for Mines.*—A. F. Brosky.—One of the troubles most often encountered in mine railway systems is the derailment of locomotives and cars. Wearing down of locomotive tires is the most frequent cause of derailment. Reports received from several mechanical engineers at mines indicate that they are practically unanimous in the belief that a locomotive should never be allowed to become more than an inch lower by wearing of the wheels. Several of the other causes for derailment are also discussed.—*Coal Age*, Feb. 8, 1923.

### Electrochemistry, Electrophysics and Batteries

*Copper.* — The Bureau of Standards plans to issue from time to time circulars on individual metals or alloys, with the idea of grouping in these circulars all the information which the bureau has as a result of its tests and investigations, together with that available in all records of published tests and investigations of such materials. This circular on copper deals primarily with the physical properties of the metal. All of the factors, except a few statistics of production, such as methods of manufacture, presence of impurities, etc., are discussed only in their relation to these physical properties. The data and information have been put in the form of tables and curves, the curves being reproduced in such dimensions that accurate interpolation of the values on them is possible by the use of a rule graduated in decimal parts of a centimeter.—*Circular No. 73 of the Bureau of Standards.*

### Telegraphy, Telephony, Radio and Signals

*Control of High-Frequency Current with Iron-Core Choke Coils and Superimposed Direct Current.*—L. PUNGS.—The necessity of easy control of large amounts of alternating currents of high frequency for radio-telephonic and radio-telegraphic use is discussed. By means of an iron-core choke coil with two windings, one for the high-frequency current and the second carrying direct current, the former can be easily controlled by variations of the latter. The paper gives several connection diagrams for the application of this method for radio telephony. — *Elektrotechnische Zeitschrift*, Jan. 25, 1923.

*Alternating-Current Cable Telegraphy.*—LOUIS COHEN.—The author discusses the so-called arrival curves for an impressed sinusoidal electromotive force on a cable with and without terminal apparatus and then compares his results with those of former investigators on the subject. The paper is limited to a consideration of fundamental principles.—*Journal of the Franklin Institute*, February, 1923.

### Miscellaneous

*The Structure of Carbon Steels.*—H. S. RAWDON and S. EPSTEIN.—A study of the microstructure of hardened and tempered carbon steels has been carried out on a series of six steels ranging from 0.07 and 1.12 per cent carbon. These were hardened by water-quenching from different temperatures ranging from 750 deg. to 1,250 deg. C. The investigation consisted largely of microscopic examination, supplemented by a study of the scleroscope hardness of the quenched and of the tempered steels.—*Journal of the Franklin Institute*, February, 1923.

## New York Water-Power Regulation

### Attempt of the Governor to Commit State to a Policy of Government Ownership and Operation Is Not Likely to Meet Success

GOVERNOR SMITH'S program for the State of New York to own and develop its water-power resources and to distribute hydro-electric energy to municipalities has met with such opposition in the Assembly that its passage at this session of the Legislature is unlikely.

The eyes of the Governor are fastened on the Niagara and St. Lawrence Rivers, both of which possess magnificent hydro-electric possibilities and both of which are international boundary and navigable streams over which the federal government exercises control.

At present there is an international treaty governing the diversion of water for power and other purposes above the falls at Niagara Falls, and an attempt has been made to draft another treaty between Canada and the United States with reference to the further canalization of the St. Lawrence River and the erection of dams for that and power purposes on the river.

A survey has been made by the International Joint Commission, which has submitted a report and recommendations to both Washington and Ottawa; but no action has been taken by either government. There is also a suit pending before the United States Supreme Court in which the State of New York questions the constitutionality of the federal water-power law and the right of the federal government to control the water powers in the boundary and navigable streams in the State of New York. A decision in this case is expected shortly.

#### The Existing Law

During the administration of Governor Miller a law patterned after the federal water-power law was enacted in New York. Under this law a water-power commission of the state grants licenses for water-power development for a period of fifty years. A fee is charged and preference is given to the applicant whose plans are best adapted properly to develop, conserve and utilize the water power of the locality.

It was the contention of Governor Miller at the time that regulated private development was preferable to state or municipal development, and he advocated the adoption of a policy which would make it practicable for private initiative to undertake the task under safeguards which would protect the public interest. Governor Smith, in fulfillment of election pledges and the platform of the Democratic party, now seeks to set aside that legislation.

Outside of the Barge Canal, the Niagara and the St. Lawrence Rivers, the two latter being involved in litigation, there are few choice water-power sites available. There is a possibility of further development on the feeders and upper reaches of the Hudson River, but the sites are all owned by paper mills and power companies. Moreover, before these water powers can be developed it will be necessary to obtain the sanction of the proper river-regulating commission.

#### River Regulation

River regulation is an established policy of the state and serves a double purpose. By the construction of dams and reservoirs seasonal floods are held in restraint and control. In addition, these dams and reservoirs permit the proper development of the hydro-electric power in the streams involved. Under the river-regulating law the state can condemn property for the construction of dams. River-regulating districts are mapped out and the cost of improvements is assessed upon the property benefited. The boards are required by law to prepare a statement of the amount of water power, if any, which, consistently with the proper regulation of the flow of the river, may be developed by the withdrawal of water for power purposes.

The Black River Commission is now constructing dams on the Black River on the petition of water-power owners who will bear the expense. Last year a similar commission was appointed for the Upper Hudson on the request of the cities of Albany and Troy and others which seek to be relieved of the menace of floods. There is no indication that the Governor seeks to wipe out these commissions.

#### Bringing Power to New York City

Chief talk in political circles centers on bringing Niagara or St. Lawrence River power to New York City and on developing the Delaware River. The latter stream rises in New York State and for a distance forms the boundary between New York and Pennsylvania and between Pennsylvania and New Jersey. The Delaware River is navigable from the ocean to Trenton, N. J., but the rights on part of it are tied up by grants antedating the Constitution of the United States. New York is seeking to come to an understanding with the other two states over the river by means of a tri-state treaty. New Jersey has already passed enabling legislation, but the other two states have not yet acted. The plan published by New York calls for the use of the water of the Delaware chiefly for drinking and sanitary purposes in New York City. If the water is to be consumed, there will be little left for water-power development or for navigation, and a pretty legal battle is sure to ensue.

As for bringing Niagara or St. Lawrence River power to New York, the dream of cheap power is likely to remain a dream and nothing more. It is, of course, feasible to transmit electricity for this distance, or any distance for that matter, if no regard is to be given to cost or to reliability of service. There are those who contend that it is cheaper to develop electricity in steam stations and that even if hydro-electricity were transmitted to New York City in bulk, steam stations would still be necessary, with the result that costs would be higher instead of lower. It probably would be necessary to make the installation, however, before the contentions made on either side of the controversy could be proved. Meanwhile the large electric light and power companies in the affected district continue to build huge steam-driven central stations, which would indicate that they do not regard the proposed transmission of hydro-electric energy as menacing their investment.

#### Up-State Enthusiasts

On the other hand, persons who are enthusiastic over the prospect of developing the boundary streams rob the politicians of their thunder by claiming that the power would be absorbed by up-state industries and cities and that there would be none left for the metropolis. This, they contended, is a better use for the power since it helps to spread industry over the state and makes for better living, transportation and industrial conditions. In no case, however, has any evidence been provided which would show that private

enterprise is not willing and competent to undertake the work of developing the water powers of the state with better results and better service than could be obtained under state ownership and operation. These are the arguments which have been put before the legislators at Albany. The financial menace of state development has also been brought to their attention, and at present the line-up is such that the Governor's program is blocked.

# Hydro Power for New York City

### Engineers Discuss Relative Advantages of Steam and Hydro-Electric Service and Availability of Niagara and St. Lawrence Power for Long-Distance Use

BEFORE a well-attended joint meeting of the metropolitan sections of the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers held in New York on Wednesday evening, the availability of hydro-electric power for the New York-New Jersey metropolitan district was discussed at length. Calvert Townley presided, and F. W. Scheidenhelm, a consulting hydraulic engineer, made the co-ordinating statement of the problem.

An approximate estimate of the available water power in the Hudson, Delaware and Susquehanna Rivers was given by W. S. Murray, who also gave the power requirements of the district and the probable cost of delivering Niagara power to New York and St. Lawrence power to New England. Much of the information was obtained from studies made in connection with the Superpower Survey of the United States Geological Survey and from subsequent surveys. Mr. Murray pointed out that steam stations would have to continue to generate the bulk of the power required in the district and that with every water power in the section developed hydro-electric energy would be available for only one-third of the load. He told of superpower stations erected since the government report was published and paid a tribute to the efficiency of electric light and power production by central stations.

#### SERVICE REQUIREMENTS OF NEW YORK

George A. Orrok of the New York Edison Company painted an impressive picture of the service requirements of the metropolis and of the precautions taken to keep the community supplied with energy at any and all times and under all sorts of conditions. He referred to the enormous loads which are thrown on the New York Edison system, sometimes for only a few moments, in the daytime owing to sudden storms and squalls. On Feb. 28, when New York City was shrouded by a London fog, the normal load of 120,000 kw. increased to 435,000 kw. in two and a half hours and remained at approximately that value for eight hours. Mr. Orrok showed how vital continuous service is to the city and intimated that a block of hydro-electric power could be absorbed in New York if the price was right.

The next two speakers, F. A. Allner of the Pennsylvania Water & Power Company of Baltimore and Lorin E. Imlay of the Niagara Falls Power Company, told of the early troubles of hydro-electric and transmission systems and showed how with experience and advances in the art reliability in generation and transmission has been secured. Mr. Allner's Holtwood station in the Susquehanna River supplies electricity to Lancaster, Pa., and to Baltimore, being operated in conjunction with huge steam stations in the latter city. He showed how the stations are operated to best advantage and how during periods of low water the peaks are carried by the hydro station and during periods of high water the procedure is reversed.

Mr. Imlay reviewed the operations of the Niagara, Lockport & Ontario system and predicted the exhaustion of nearby coal fields in the near future, intimating that hydro-electric power would have to be relied on more and more by the industries of the state.

Contributions to the discussion were made by John P. Hogan, a consulting engineer of New York, and W. S. Finlay, Jr., vice-president of the American Water Works & Electric Company. The latter compared the service in the metropolitan district with that obtainable elsewhere and contended that such excellent service must of necessity be costly. He doubted whether inferior service at cheaper cost would be acceptable and said the issue would have to be decided before long. The district could absorb considerable hydro-electric power of right quality and price. One of the speakers suggested that by means of interconnections it might be possible and profitable for the steam stations of New York to sell supplementary power to nearby hydro-electric systems.

## Asks $710,000 for Vischer's Ferry and Crescent Dam

In a special message to the Legislature asking for the appropriation of $710,000 to finish the state water-power development on the Barge Canal at Crescent Dam and Vischer's Ferry, on which $1,000,000 has already been expended, Governor Smith of New York suggests that the law be amended to permit the Superintendent of Public Works, the State Engineer and the Attorney-General to negotiate with the municipalities in the capital district, where the plants are, for delivery to them of this power at cost for ultimate sale to consumers. He also suggests that, inasmuch as engineers estimate that power from these plants will be available only 60 per cent of the time, these municipalities might be asked to generate auxiliary power themselves, or possibly the state might do so, in order to have available at all times sufficient firm power to meet the requirements of users in the capital district.

The plant at Crescent Dam is completed with the exception of the tailrace and contains two units capable of developing 8,000 hp. At Vischer's Ferry, where it is the intention to install similar equipment, the two plants to be run as one, only the foundation has been laid.

## Governor Smith Retreats

### He Now Says that "Interstate Exchange of Electrical Energy" Is "Probably Not Far Off"

IN ANSWER to the letter from Governor Pinchot of Pennsylvania asking him to discontinue the suit brought in the name of New York State against the Federal Power Commission and pointing out the impolicy and impracticability of New York's attempting to confine the use of her water power within the state borders (see ELECTRICAL WORLD, March 17, page 646), Governor Smith of New York, while maintaining his determination to contest federal control of the water powers on the navigable rivers of the state, goes on to say:

"I agree with you that the time is probably not far off when there will be an interstate exchange of electrical energy, in which event, of course, the State of New York would be one unit. Nothing contained in or contemplated by the state's suit to test the constitutionality of the federal water power act need interfere with the eventual accomplishment of that purpose. The State of New York may ultimately determine that the people of the State of Pennsylvania, or for that matter of any other state, would be considered in the distribution of electrical energy. When that happens, however, with New York's property it should be done by New York and not by the federal government. We need no federal assistance to promote useful helpfulness and consideration between the states."

This utterance indicates a marked modification of the opinion expressed by Governor Smith in the message on water power sent by him to the New York State Legislature, when he said:

"The bed of our streams over which power-creating water flows belongs to the state, or, better still, to its citizens. Our use and control of the same is threatened. I am credibly advised that a strong and determined propaganda is now being spread in support of a plan to divert the electrical energy from our border streams to territory outside the state. This we must resist with all the power that we can bring to our command."

# Conference Discusses Radio Chaos

## Organized Co-operation Imperative in Face of Lack of Legislation—Reallocation of Wave Bands to Alleviate Interference Is Favored—Recommendations of Radio Inspectors

A CONFERENCE called by Secretary of Commerce Hoover to consider the chaotic condition in which radio transmission has been left by the failure of Congress to take action was held in Washington on Tuesday and Wednesday of this week. In opening the meeting Secretary Hoover offered to suggest to the President that the wave length reserved to the government (600 m. to 1,600 m.) be opened to broadcasting, at least in the lower part of its range. Since the last conference, one year ago, he said, the number of broadcasting stations has increased from 60 to 588 and the number of receiving stations has more than doubled and now is somewhere between one and a half and two and a half millions. He called for organized co-operation to meet the emergency.

Virtually all who participated in the conference recognized the paramount interest of the public and favored a reallocation of wave bands. Maintenance of wave lengths by transmitting stations was declared imperative.

### Discussion on Broadcasting

Gen. G. O. Squier, U. S. A., saw no reason why the government's reserved wave lengths could not be thrown open and expressed faith in co-operation stimulated by the Secretary of Commerce. Commander D. C. Bingham, U. S. N., said the needs of ships and aircraft must not be overlooked. Civic bodies must, he said, co-operate, for there are not enough practicable wave bands for all. Dr. A. N. Goldsmith, secretary of the Institute of Radio Engineers, thought that economic reasons would cause the discontinuance of high-class broadcasting unless it can be protected. Hiram Percy Maxim of the American Radio League suggested the exclusion of advertising. C. B. Cooper favored regulating schedules rather than wave lengths. E. H. Armstrong, Columbia University, announced that if proper wave bands can be allocated apparatus which can receive from any station in the land will be ready in a year or two.

Two suggestions that met with considerable approval were made by J. V. L. Hogan, consulting engineer. Because of the relative number of channels available above and below 600 m., he contended, the higher-frequency range should be allotted to telegraphy and the lower range to telephony. To make policing stations unnecessary, he suggested that recording wave-length meters be required in every transmitting station.

F. P. Guthrie, United States Shipping Board, promised co-operation, and representatives of the Post Office, Agricultural and Treasury Departments expressed their warm interest in the subject. Leo Fitzpatrick, speaking for the newspapers, thought the government radio inspectors would form a good nucleus of a force to alleviate interference. J. H. Dellinger, Bureau of Standards, spoke of the increasing use both of electron-tube oscillators and of shorter wave lengths as important factors.

A recommendation covering an allocation of wave lengths between 150 m. and 3,850 m., prepared by a committee of radio inspectors, acting at the instance of Mr. Hoover, was submitted by W. D. Terrell, their chief. The allocations were based on the existence of 22,740 transmitting stations.

"Heretofore," said the report, "the broadcasting service has been limited to the specific wave lengths of 360, 400, and 485 m. The committee has provided six bands of wave lengths for the broadcasting service (320, 380, 390, 430, 675, 725 m.), two of which are within the government reservation. This arrangement will permit the reception of signals from several stations operating simultaneously in close proximity with the minimum interference possible under our present limitations, provided receiving apparatus of reasonable selectivity is employed and adjusted efficiently."

Mr. Terrell thought an expensive policing system necessary to the maintenance of wave lengths. Paul Godley urged allowing amateurs shorter wave lengths, and K. B. Warner outlined the field organization they have already achieved in a voluntary effort to avoid interference.

Other experts discussed the transmission of motion pictures, told of successful voluntary co-operation of eighteen broadcasting stations near San Francisco, and described the successful staggering of wave bands according to the nature of the program and the location of the station.

Ship interference caused much animadversion. It was said to reach even to the Middle West. One speaker urged that ships be compelled to substitute continuous-wave sets for spark sets.

### Public Hearing Backs Conferees

At a public hearing on Wednesday stress was laid on the same points emphasized previously by the members of the conference and the inspectors. A representative of the General Electric Company, Mr. Edwards, said its broadcasting, rated at from 1½ kw. to 2 kw. at 400 m., is received regularly in Hawaii and had been picked up on the west coast of Panama; E. F. W. Alexanderson said that the Radio Corporation desired three wave bands—transatlantic, ship-to-shore and for broadcasting; R. A. Weagant urged high-power stations on special wave bands for long-distance broadcasting; C. N. Jansky described co-operative methods in Minneapolis and St. Paul, and Allen M. Perry, engineering editor ELECTRICAL WORLD, suggested gathering through the newspapers public opinion on what kind of broadcasting is objectionable.

Simultaneous sending at 360 m. and 400 m. was discussed. A representative of the Society of American Composers and Authors dwelt on the copyright complication that arises in broadcasting music and said legal proceedings might be necessary to protect composers. The Federal Telephone & Telegraph Company, Buffalo, requested a wave length of 300 m. to 500 m. for broadcasting, but urged the elimination of harmonics in this band. Strenuous objection was raised to interspersing other than broadcasting wave bands between broadcasting frequencies. Amateurs should not be limited further, it was contended, but the transmission equipment should be limited in character for wave lengths above 200 m.

# New Peoria Plant with Initial Rating of 53,300 Hp.

The Illinois Electric Power Company, a subsidiary of the Commonwealth Power Corporation, has acquired property rights in a site on the Illinois River opposite Peoria, Ill., and will immediately begin the construction of a generating station with an initial rating of 53,300 hp. and an ultimate capacity of 133,000 hp. The company will also construct more than 65 miles of 120,000-volt transmission lines connecting with the distributing system of the Central Illinois Light Company at Peoria and with that of the Illinois Power Company at Springfield, thus forming a physical interconnection of these three properties. With the added capacity of the new station, the combined companies will have a generating capacity of more than 102,000 hp.

# New England Power's Program to Cost $3,000,000

Construction work to cost in the vicinity of $3,000,000 is planned by the New England Power Company, Worcester, Mass., in the near future. The company has petitioned the Massachusetts Department of Public Utilities for the right to issue 30,000 shares of common stock at $100 per share to cover the following prospective outlays, grouped under "Davis Bridge," "Pittsfield" and "miscellaneous": Davis Bridge—Two-circuit, 110,000-volt line to Millbury, Mass., $1,890,182; extension of Millbury substation, $240,600; synchronous condenser, 10,000 kva., for Millbury, $107,455; improvements at No. 5 station near Hoosac Tunnel, 70,000-volt bus structure, $75,850. Pittsfield—24-mile, 66,000-volt line to Massachusetts-New York state line, $259,200; Lanesboro substation, $130,000; increased capacity Adams substation, $40,000; second circuit Davis Bridge to No. 5 station, $41,000; additional equipment for this circuit, $30,000. Miscellaneous—Additional transformer capacity, Fitchburg and Ware, Mass., $123,300; 22,000-volt line, Ware to Otis Mills, $12,000; Otis Mills substation, $24,400; sundry expenses, $240,785.

## A. I. E. E. Nominations

**"Directors' Nominees" Selected—Prof. Harris J. Ryan of Stanford for President**

AT THE meeting of the board of directors of the American Institute of Electrical Engineers held in New York on March 16 the report of the committee of tellers on its canvass of the nomination ballots cast for candidates for the Institute offices falling vacant July 31, 1923, was presented.

As required by the constitution of the Institute, the board then selected by ballot its list of "directors' nominees," with the following result:

For president—Harris J. Ryan, Stanford University, Cal.

For vice-presidents—District No. 2 (Middle Eastern), William F. James, Philadelphia; district No. 4 (Southern), H. E. Bussey, Atlanta; district No. 6 (North Central), Herbert S. Sands, Denver; district No. 8 (Pacific), J. E. Macdonald, Los Angeles; district No. 10 (Canada), S. E. M. Henderson, Toronto.

For managers—H. P. Charlesworth, New York; William M. McConahey, Pittsburgh; W. K. Vanderpoel, Newark, N. J.

For treasurer—George A. Hamilton, Elizabeth, N. J.

The election ballots, including the names of the directors' nominees and all other eligible candidates, will be mailed to the membership prior to April 1.

## New British Specification for Motors and Generators

The British Engineering Standards Association has just issued a publication, No. 168-1923, giving the British standard specification for electrical performance of industrial electric motors and generators with class A insulation. This publication is the action resulting in Great Britain from the recent meeting of the advisory committee on ratings of the International Electrotechnical Commission in Geneva, when a 40-deg. rating with a two-hour 25 per cent overload was authorized for certain classes of industrial motors in addition to the former I. E. C. standard of 50 deg. continuous.

As noted in the letter of transmittal from C. le Maistre, secretary of the association, the specification applies to industrial electric motors and generators for 1 b.hp., 1 kw. or 1 kva. and upward per 1,000 r.p.m., having windings insulated with class A material (impregnated cotton, paper or silk), wound for voltages not exceeding 7,000 and having either a continuous or a short-time rating.

In the words of the secretary: "Stated briefly, the new British standard rating is: Temperature rise (on rated load), 40 deg. C.; temperature rise for totally inclosed machines and machines with short-time ratings, 50 deg. C.; dielectric test, 1,000 volts plus twice rated voltage; momentary overload, short-time-rated machines, 100 per cent for thirty seconds; momentary overload, continuous-rated machines, 50 per cent for five seconds; sustained overloads, short-time ratings and all totally inclosed machines, none; sustained overloads, continuous rating, 25 per cent for two hours except for small machines. No provision is made for tests of temperature rise after the sustained overloads."

The entire specification is quite complete and detailed. It is the first of a series designed to supersede the British "Standardization Rules for Electrical Machinery" (Publication No. 72-1917).

## To Expand Tests on Insulating Materials

At a meeting of the committee on insulating materials of the American Society for Testing Materials held in New York last week three new tentative standards were considered for submission to the society in June. These include a method of testing insulating materials for puncture and flashover voltages at radio frequency, a method of testing electrical insulating materials for thermo conductivity, and methods of test for pothead and splicing compounds. Details of these standards will be available in reprint form for advance study by the first of May.

It was agreed to expand the existing tentative method of testing sheet insulating materials for dielectric strength to include cambric tape, a procedure for tapes having been devised. There will be added to the existing methods of testing insulating varnishes a non-volatile matter test, a draining test (working viscosity) and an evaporation test. The existing method of test for power factor and dielectric constant of molded insulating materials at radio frequencies will be expanded to take care of sheet materials and compounds.

An extensive discussion was had of the results of the long investigation of four methods of determining the sludge-forming propensities of transformer oils and a final recommendation to the society was agreed upon. It was agreed that the annual report should include a quite extensive discussion of this subject. It was also agreed that the annual report should include as an appendix a convenient and accurate method of testing insulating materials for power factor and dielectric constant at normal commercial frequencies which has been brought to the attention of the committee. It is particularly suited to tests of liquid insulations and compounds over a wide range of temperatures.

The annual report is also to include an appendix describing a new method for determining the relative rate of deterioration of transformer oils. The results of an investigation of the effect of the rate of application of potential on the apparent dielectric strength of insulating materials will also be included in the report.

## To Cross the Sierras

**California and Nevada Companies to Be Connected by a Transmontane Transmission Line**

AN AGREEMENT between the Pacific Gas & Electric Company of San Francisco and the Truckee River General Electric Company of Reno, Nev., for the construction of a transmission line over the Sierra Nevada Mountains has recently been reached, according to E. W. Florence, manager of the Sacramento division of the first-named company. The Truckee General Electric Company serves a mining load in the Comstock district, and the revival of mining there has greatly increased the demand made upon the company.

To meet this increased demand arrangements have been made for the Pacific Gas & Electric Company to supply additional power to the Nevada company. A line will be constructed from the Drum power house on Bear River, near Towle, Cal., over the summit of the Sierra Nevada Mountains and will connect with the lines of the Truckee company at Verdi, Nev. The construction of the lines over the mountains will have to be of extremely rugged construction because of the heavy snows in the region, the snow often reaching a depth of from 5 ft. to 20 ft. The lines of the Truckee company will have to be increased in size in order to care for the larger load that will be handled by the company. The Truckee General Electric Company now serves the cities of Reno, Carson and Virginia City and the surrounding territory.

## Providence Company to Build 125,000-Kva. Switch House

On March 8 the Narragansett Electric Lighting Company sustained an interruption of service during the early morning hours on account of short circuits in cable and switch equipment at the South Street generating station.

For more than a year the company has been studying the development of its cable and switch-handling equipment. The accident has given increased impetus to its plans, and a switch house embodying the latest ideas in isolated-phase design will soon be built. It is hoped to have the new installation completed inside of twelve months. Dwight P. Robinson & Company, New York, have been planning this development for the Narragansett company, and engineers of the General Electric and Westinghouse companies have also been in consultation. During the interim before the new switch house can be placed in service temporary changes will be effected along the line of greater separation of existing cables, the installation of fireproof barriers in the more congested sections, the division of the cable vault into two sections at South Street and the placing of various disconnecting switches outdoors.

## Appliances Lose Ground

**Southwest Division Men Hear Opinion to This Effect—Good Commercial and Technical Sessions**

THAT the appliance industry is steadily losing ground in relation to its sales possibilities in the electrified home was the assertion made by Martin L. Pierce, promotion and research manager of the Hoover Company, North Canton, Ohio, in discussing the potential market for electric appliances before the March 16 meeting of the convention of the Southwestern Geographic Division of the National Electric Light Association at Oklahoma City, of which the opening session was reported last week. If the rate of increase in electrical appliances and the increase in wired homes during 1921 and 1922 continue for the next ten years, he said that only 20 per cent of the electrified homes will have electric cleaners, as compared with the present 40 per cent, and that the same statement applies to all appliances.

Mr. Pierce recommended settlement on a standard-cost basis of doing business such as other lines of industry have adopted and a merchandising campaign that will last twelve months of the year. Standardization of electrical appliances, elimination of poor equipment and standardization of trade discounts were urged.

A. K. Baylor told of the work of the Joint Committee on Business Development, and a committee was appointed to take up the work of organizing the various branches of the electrical industry in the five states of the division for business development work.

Organization of employees' clubs is not a charitable undertaking into which a company must put a great deal of expense, J. H. Gill said, in presenting the report of the committee dealing with employee organizations. Such organizations are more successful if self-supporting and managed by employees themselves. The committee presented a model form of organization for such clubs.

E. W. Hodges, manager of the Arkansas Utility Information Bureau, made a plea for greater service in building up the community and said that while utilities have always been community builders, they have many times gained the reputation of being "hard-boiled" because they have not told their stories properly and shown their community the place they occupy in its welfare. He advocated reaching every class of citizens personally with utility facts.

### Commercial Section

In the Commercial Section meetings the problem of ice-plant loads was the subject of a discussion led by R. I. Brown, who spoke on standby or fixed charges in the energy rates. A form of rate in which the four months from November to February are considered off-peak and in which some modification of the demand charges is made was attacked on the ground that the utility could not ordinarily make use of the unused capacity in these months and therefore could not, in justice to itself, remit any part of the demand charges. The question as to whether such a rate is discrimination against other power consumers was also raised. A form of rate in which the summer demand is taken as twice the winter demand in order to compensate for the off-load period of the year was discussed by E. H. Kifer of San Antonio, Tex. This rate was said to have been very successful and to meet the common objection from the ice-plant owner to the payment of fixed charges during the winter months.

J. R. McCoy of Dallas, Tex., presented figures to show that the electric motor-driven plant for ice manufacture is most desirable because it requires the least amount of building space and the least amount of skilled labor and shows the least depreciation. With electrical energy at 1.5 cents, coal at $4.50 at the boiler room and fuel oil at 5 cents per gallon, the manufacturing costs of ice, including operating and fixed charges, were shown to be $2.17 per ton for an electric motor-driven plant, $2.34 with a uniflow steam-engine drive, $2.32 with a Diesel engine and $2.38 with a semi-Diesel engine. Although plant power costs in the electrically driven plant were shown to be 32 per cent of the cost, with fuel costs in the other plants at 11 to 14 per cent of the total, the lower investment, labor and maintenance costs give the electrically driven plant the advantage.

### Technical Section

In the Technical Section meetings the treatment of boiler-feed water was advocated by C. B. Oliver of Dallas, Tex., who said that a test of boiler water daily, "flowing down" two to five times daily and regular feeding of chemicals in small quantities were the three requisites for successful operation of a small system. The material needed is a 50-gal. steel barrel, a supply of soda ash (58 per cent light), a water-testing outfit and the necessary connections to the feed-pump line. Before any treating is undertaken, Mr. Oliver said, an analysis of the water by a competent chemist is essential.

A maintenance schedule for Diesel engines was outlined by J. L. Schneitter of Dallas, Tex., who named inspections for each part of the engine, a maintenance calendar listing the time and frequency of inspections and a suitable report sheet as the essentials of such a schedule.

The combined registration of the Oklahoma Utilities Association and the Southwestern Geographic Division of the N. E. L. A. was more than 600, and the sessions were enthusiastic all the way through. Officers elected for the Southwestern Geographic Division are: President, J. W. Carpenter; vice-presidents, C. J. Griffith of Arkansas, W. E. Clements of Louisiana, J. L. Longino of Mississippi, J. F. Owens of Oklahoma and A. H. Warren of Texas. C. E. McBride of Dallas was re-elected treasurer.

## St. Louis Has Well-Attended Electrical Exposition

The electrical exposition held in the Coliseum, St. Louis, March 12 to 17 inclusive, was a success both electrically and financially. More than thirty-five thousand persons attended during the week, notwithstanding some inclement weather. Several thousand articles portrayed development of electricity in industry, commerce, art and the home.

Special artistic effects made a striking setting for the exposition. A "sunburst" in various colors bore the sign "Electricity," which gradually changed to "Prosperity." Gauzy blue material veiled the ceiling and was made at intervals to appear like a starlit sky and at other times like daylight by a 100,000-cp. light source supplied by the General Electric Company and suspended in the center of the building. A chromatic fountain and an electric storm were among other illuminative features.

There were eighty-one exhibitors, including the Union Electric Light & Power Company, the Bell Telephone Company, the Westinghouse Electric & Manufacturing Company and the General Electric Company. C. E. Michel, sales manager of the Union Electric Light & Power Company, was president of the exposition company.

## Division Meetings Planned for Contractor-Dealers

At an executive committee meeting of the Association of Electragists International held in New York City on March 14-15 a transcontinental trip was planned to be undertaken by James R. Strong and Laurence W. Davis, president and director of promotion and development respectively of that organization. The object of this trip, which will begin about the middle of June and end some time in August, is to hold divisional and other meetings of the membership. A plan is now being worked out whereby divisional meetings will become regular features in the future under the direction of and arranged by the association headquarters.

The tentative itinerary of the headquarters officials' coming trip includes Pittsfield, Mass., Chicago, Omaha, Denver, Salt Lake City, Los Angeles, San Francisco, Portland, Seattle; Vancouver, Calgary, Moose Jaw and Regina, Canada; Minneapolis and St. Paul.

## States May Forbid Change of Existing Contract Rates

The Arkansas law prohibiting the Arkansas Railroad Commission from changing gas and other rates existing at the time authority to change rates was given to the commission is not discriminatory and comes within the power of the state, the United States Supreme Court has declared in effect, in reviewing an action brought by the Arkansas Natural Gas Company against the Railroad Commission.

The company sought an injunction

against orders for reduced rates to certain consumers which maintained in effect contracts with the Little Rock Gas & Fuel Company and the Consumers' Gas Company, the latter being a Hot Springs distributing company. The United States District Court granted the injunction in the first instance and denied it in the latter, the company appealing. The company sought a flat rate for city-gate delivery to the distributing companies, instead of the divisional rate which existed in the contracts, alleging that poor management made this divisional rate confiscatory.

# Illinois Utility Men Hold Practical Meet

## Educational Courses, Appliance Surveys, Prevention of Theft of Energy and the Merchandising of Appliances Are Leading Topics at Convention

PUBLIC utility educational courses at universities received emphatic indorsement from the third convention of the Illinois Utilities Association, held in Chicago on March 14 and 15. In addition to the speakers on this topic named in the preliminary report last week (page 647), Bert H. Peck of St. Louis and D. W. Snyder expressed their approval of the movement, which Dean Heilman of Northwestern University said would do much to provide utility organizations with a voice.

Edward Taylor, General Electric Company, Chicago, discussing the paper already noticed on "Remote-Controlled Substations," by H. E. Wulfing, Commonwealth Edison Company, before the Electric Section, held that a further use could be made of such a synchronized control for extending lines already in use. These substations have been so successful, he said, that inspections had been reduced from two a day to two a week.

How to handle customers caught stealing electricity was discussed at some length. In most such cases the meter is immediately removed to force the customer to come to the office and pay up before service is again given him. Mr. Williamson, Moline, Ill., stated that, upon this final settlement, his company installs a new type of inclosed service switch, conduit and meter flush to the wall which goes far to prevent tampering. He felt that legislation for prevention of energy theft could be well sponsored by the Illinois State Electric Association. Mr. Larkin, Public Service Company of Northern Illinois, said he found ten jumpers upon a single inspection trip in the South Chicago steel mill district.

### A Story of Finance

The annual banquet was held Wednesday evening with Britton I. Budd as toastmaster. E. Hill Leith, Halsey, Stuart & Company, presented the financial story of public utilities. He figured the wealth of the entire United States back in 1858 to be equal to the present value of all public utilities—$16,000,000,000. With the country's total wealth today between $250,000,000,000 and $300,000,000,000, progress would depend upon the progress of the individual utilities. Mr. Leith enumerated five essential factors in financing utilities—cultivation of public appreciation of the needs of the industry, recognition of the fundamental principle that utilities must exist without competition, a vision of the next five years' developments, and a sense of the importance of common stock and of the growing necessity for non-par-value stock.

During the Thursday morning session E. W. Lloyd, Commonwealth Edison Company, spoke of the work of the Joint Committee for Business Development and urged the selection of local correspondents for the committees formed by the central stations and contractor-dealers in the various cities.

B. J. Mullaney, director Illinois Committee on Public Utility Information, told of the 108,000 column-inches of utility news that had been published by the newspapers during the past four years. Reviewing the work of the committee, Mr. Mullaney declared that during 1919 and 1920 many legislative bills were offered in the Illinois Legislature which were hostile to the utility industries, while in 1922 not a single such bill was presented.

### Merchandising Appliances

The afternoon session was given over to merchandising problems. H. B. Gear, Commonwealth Edison Company, explained his paper surveying the electrical appliances used in Chicago. One peculiar item he found was that the number of washing machines in medium-sized houses averaged 46.2 per cent, while for apartments it was only 8.2 per cent. The flatiron was found to be the leader, while percolators were fewest in number.

The development of the "Mazda" lamp was described by F. T. Benson, General Electric Company, who demonstrated the new 30,000-watt incandescent lamp designed primarily for motion-picture work. He prophesied that the time would come when central stations would consider a change in their rates from an energy to a candlepower basis.

"Merchandising Domestic Appliances" was considered by R. S. Bell, United Appliance Company, Akron, who described the systems in use in northern Ohio. Weekly sales meetings lasting one hour are held in each district which are addressed by manufacturers' representatives and two or three salesmen. Regarding remuneration, Mr. Bell found it advisable to pay his district managers a salary plus a percentage of net profits, to pay his floor saleswomen a salary plus a small commission on all personal sales, and to pay the outside salesman a salary and commission, or a straight commission upon showing actual sales ability.

A. M. Floyd, Commonwealth Edison Company, spoke on electric cooking and cited a Chicago installation where a monthly saving of $65 was effected as compared with the old fuel-type range. Daniel Seymour, Edison Electric Appliance Company, said bakers save a half ounce of dough per loaf by electrical baking. In one case this raised production from 600 loaves to 695.

The officers for the ensuing year are: President, D. W. Snyder, Jr., Bloomington; vice-president, Bert H. Peck, St. Louis; secretary-treasurer, R. V. Prather, Springfield. The new members of the executive committee are R. S. Wallace, Peoria; H. O. Channon, Quincy; B. J. Denman, Davenport, and C. D. Ingersoll, Canton.

# Indiana Companies Suffer from Heavy Storm

A heavy storm of wind and rain which swept over a large section of the Middle West last week, causing severe losses in Nebraska, Oklahoma and other states, made itself felt in Indiana, particularly in the southern part. Many industries in the northern half of Indianapolis were without light or power for twelve hours because of the destruction of poles and cables belonging to the Indianapolis Light & Heat Company. The Merchants' Heat & Light Company seemed to suffer less. The Indianapolis Street Railway and the interurban companies operating into Indianapolis were forced to suspend service for longer or shorter periods. The transmission wires of the Interstate Public Service Company between Shelbyville and Columbus were put out of commission and many poles went down. Electric light and street-car service in South Bend was crippled, and electric light service in Evansville was interrupted for some time. Traffic in Muncie was paralyzed by the breakdown of the Anderson power plant of the Union Traction Company.

# Pittsburgh Utilities Corporation Is Formed

The detailed reorganization plan of the United Railways Investment Company, providing for the formation of a new corporation to be known as the Pittsburgh Utilities Corporation, has been announced by letters sent out by Mason B. Starring, president, to the stockholders. According to the plan the new corporation will take over from the company 480,000 shares of common capital stock of the Philadelphia Company, now pledged to secure an issue of bonds maturing May 1, 1926.

The object of the plan, the president's letter says, is to free the company from debt by retiring the existing bond issues and other funded indebtedness and by retiring both classes of dividend certificates, thereby removing restrictions against payment of cash dividends.

# Detroit Goes to Pulverized Fuel

### New Trenton Channel Station to Be Connected with Marysville by Semicircular 130-Mile, 120,000-Volt Transmission Line, Which Will Tie in with Other Lines

UTILIZING powdered fuel under the boilers of its new Trenton Channel station, the Detroit Edison Company purposes to meet the needs of its rapidly growing load by building a 130-mile, 120,000-volt double-circuit steel-tower line from that station through a half circle to its Marysville station. This high-tension line will be connected to the existing 24,000-volt, three-phase network at four transformer stations. Eventually 24,000-volt radial feeders will distribute the energy in the outlying territory from each of these transformer stations, so that there will be the same number of transformations from a generating station to any consumer.

In order to serve the heavy industrial load just north of the new Trenton Channel station, now under construction, a 120,000-volt line will be built from the switching station near Trenton Channel. The entire output of the Trenton Channel station will be transmitted at 120,000 volts in these districts, and the tie with the Marysville station affords a second source of supply. For heavy industrial loads in this district 23,000-volt feeders can be used from two or more transformer stations to give continuity of service.

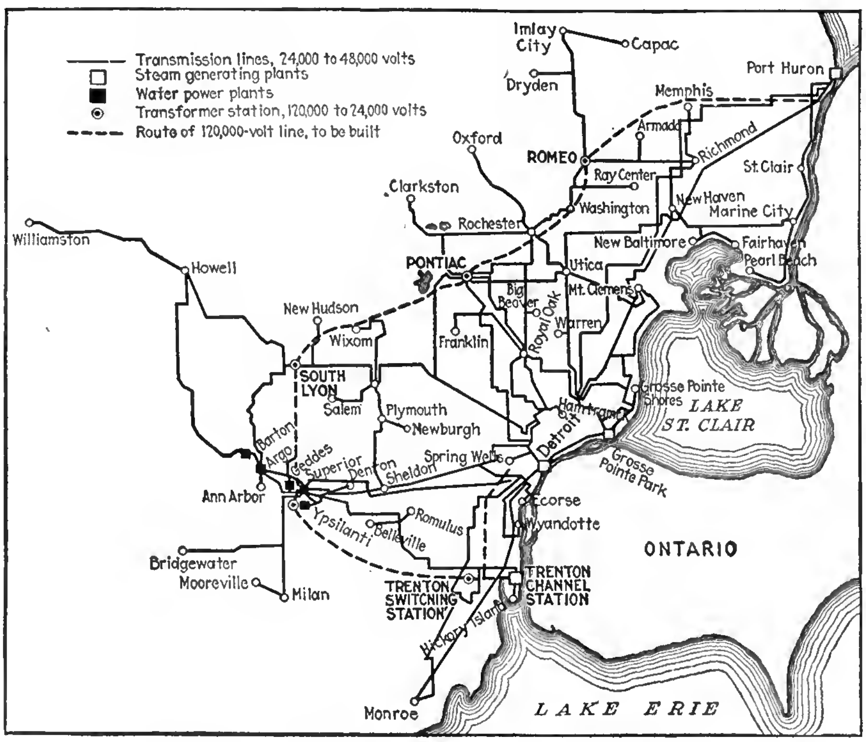
For the city of Detroit the Connors Creek and Delray stations will distribute energy at 24,000 volts, and these two stations are tied in with duplicate tie lines. The Marysville station will provide service for its local service and in addition will be tied to the high-tension system and the 24,000-volt network. At present there are two 48,000-volt lines from the city to Marysville, two others south to Monroe, one west to Ann Arbor and two northwest to Pontiac. Thus the systems now used are 24,000-volt underground cables of No. 2/0 size to substations in the city and 24,000-volt and 48,000-volt No. 0 overhead lines to outlying substations, and to these will be added the outer 120,000-volt high-tension line. All city distribution is underground at 24,000 volts to substations from which secondaries operate at 4,600 volts, three-phase, three-wire, with some 2,300-volt residential service.

At present the Detroit Edison Company operates three plants which normally feed independent groups but have tie-line connections as outlined. The Connors Creek station has 180,000 kva. installed, the Delray station has 120,000 kva., and the new Marysville station, which began operation in October, has 40,000 kva. The daily peak load on the system is about 250,000 kw., with an annual output in 1922 of 1,105,211,100 kw.-hr. The new Trenton Channel station has the foundations installed and is expected to be in operation within eighteen months. It will eventually contain six 50,000-kva. units, two of which will be installed to start with.

#### Pulverized Fuel Adopted

The new station will contain an initial installation of six type W Stirling boilers of about 2,900 hp. rating and will, as already mentioned, utilize pulverized fuel in the furnaces and main unit bleeding for the feed-water system. The changes in sizes of boilers and in practices in power production are well illustrated by the stations of the Detroit Edison Company. The Delray station contains nine 2,365-hp. boilers, two 1,300-hp. boilers and twenty-four 500-hp. boilers. The 500-hp. and two or three other boilers are equipped with economizers and the station uses open feed-water heaters and, for the most part, reciprocal steam-driven auxiliaries.

It is interesting to note, however, that when the older power house No. 1 turbine room at Delray was re-equipped in 1922 recourse was had to steam extraction from the main turbines for feed heating, with electrically driven auxiliaries. The arrangement is extremely simple since steam is bled from but one turbine stage and the proximity of the newer plant (power house No. 2) makes possible the omission of house turbines affording an independent supply of auxiliary power. The auxiliary system proposed for Trenton Channel, however, is the outgrowth of this earlier system, which has established its merit through these years of successful operation.



MAP OF DETROIT EDISON SYSTEM, SHOWING COMING CONSTRUCTION

#### Connors Creek Practice

The Connors Creek station uses fourteen 2,365-hp. boilers with electrically driven auxiliaries and a vacuum system of feed-water heating in which the condensate from the main units is used as circulating water in the barometric condensers, which receive steam from the auxiliary turbo-generators. The evaporator system of make-up is also used.

In the Marysville station there are four 2,820-hp. boilers and all auxiliaries are electric with the exception of one reserve boiler-feed pump and a general service pump. The feed-heating system utilizes surface condensers with outside air coolers with evaporators for make-up water. The house turbines are bled for heating the building.

The Detroit Edison system is growing rapidly and serves a territory extending more than 100 miles north and south and more than 75 miles east and west. It has a system load factor of about 68 per cent and has taken a leading part in making new developments.

# To Study New England Power

Charles T. Main of Boston, an industrial engineer, has accepted the chairmanship of the committee authorized by the executive committee of the Associated Industries of Massachusetts to make a survey of the power situation in New England. Associated with him will be Prof. Dugald C. Jackson, head of the department of electrical engineering, Massachusetts Institute of Technology; Henry I. Harriman, president of the New England Power Company, and George L. Finch, engineering superintendent of the Hood Rubber Company.

# Brief News Notes

**North Carolina State College Holds Meter School.**—A school for electric metermen has just been held for the first time at the State College, Raleigh, N. C., under the auspices of the department of electrical engineering. The college made no charge for tuition, and in addition to the teaching staff of the department a number of the largest electric companies in the country agreed to furnish experts to assist with instruction and equipment.

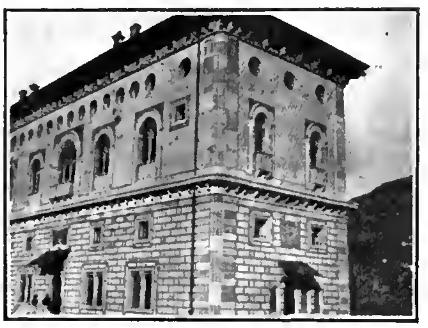
**New Unit to Be Added at Roosevelt Dam.**—An additional 7,500-kw. unit for further utilization of water at the Roosevelt Dam on Salt River, Ariz., will be installed by the Salt River Valley Water Users' Association. Nineteen control gates will be added in the spillways of the dam, and another dam and power house will be constructed further down the river to control the release of water for irrigation to permit of higher load factor on the present power plant at the dam. The Water Users' Association will issue $1,800,000 in 6 per cent bonds for financing the project. It is planned to have the new unit ready for operation within a year.

**Interstate Public Service Company Grows.**—A considerable increase in the business of the Interstate Public Service Company of Indianapolis in 1922 over the preceding year is shown in the president's annual report. A transmission line is being constructed between Cambridge City and Newcastle and plans have been made for important additions to the company's plants at Shelbyville and Jeffersonville. The report shows that the number of customers served by the company's utility plants was increased by 4,492 in the year. The connected lighting load was increased 11.8 per cent and the power load of Dec. 31 was 10.2 per cent greater than at the close of 1921. The total kilowatt-hours sold increased 25.2 per cent. Merchandise business shows a 50 per cent increase. The financial report showed gross earnings for the year of $4,276,665.78 and net earnings of $963,821.

**Geological Survey Issues Power Map of Kentucky.**—A map of Kentucky showing the locations of the power stations and transmission lines used in public service in that state and the names of the public utility companies has just been published by the United States Geological Survey. This map, which measures about 27 in. x 63 in. and is on a scale of about 8 miles to the inch, is the latest of the series of state power maps published by the Geological Survey. The others are of New York, Pennsylvania; Maine, New Hampshire and Vermont; Massachusetts, Rhode Island and Connecticut; Maryland, Delaware and the District of Columbia; New Jersey, Virginia, Indiana, and West Virginia. These maps may be purchased from the director of the United States Geological Survey for 50 cents each.

**Research Graduate Assistantships.**—The engineering experiment station of the University of Illinois again calls attention to the fact that, to assist in the conduct of engineering research and to extend and strengthen the field of its graduate work in engineering, the university maintains fourteen research graduate assistantships. Two other such assistantships have been established under the patronage of the Illinois Gas Association. These assistantships, for each of which there is an annual stipend of $600 and freedom from all fees except the matriculation and diploma fees, are open to graduates of approved American and foreign universities and technical schools who are prepared to undertake graduate study in engineering, physics or applied chemistry. This year the latest date for filing applications has been extended to April 1. Additional information may be obtained by addressing the director of the experiment station at Urbana.

**How They Do It in Italy.**—The accompanying picture is not of a millionaire's suburban villa, but merely the



"switch cabin" or substation of the Acciaierie Lombarde of Milan at Morbegno, Italy, near Como, the beautiful "home town" of Alessandro Volta. The company is installing a new high-tension line, and the building embodies its conception of what a substation should look like.

**Some California Projects.**—Applications for permits to appropriate water in California received by the State Department of Public Works during February included several relating to power projects. Of these the largest is that contemplated by W. H. Samson of Corning, who sought permission to use 1,250 sec.-ft. and 200,000 acre-feet of water from Clear Creek to be diverted into Shasta County. The application says that it is proposed to develop 128,000 hp. H. L. Shannon of San Francisco made application for a permit to appropriate 150 sec.-ft. of water from the Sacramento River, in Tehama County, with which to develop approximately 10,200 hp. A permit has been granted to P. B. Cross of San Francisco to appropriate water from Deer Creek, in Tehama County, for developing approximately 18,600 hp., and another has been issued to the Utica Mining Company of San Francisco for 6,144 acre-feet of water per year from Highland Creek, in Tuolumne and Calaveras Counties, to develop about 3,300 hp.

# Associations and Societies

**Northwest Electric Light & Power Association.**—The annual convention of the Northwest Electric Light and Power Association, to be held in Seattle, has been set for June 27-30. N. W. Brockett is chairman of the program committee.

**National Association of Manufacturers.**—The twenty-eighth annual convention of the National Association of Manufacturers of the United States of America will be held at the Waldorf-Astoria, New York City, on May 14 to May 16.

**Chamber of Commerce of the United States.** — "Transportation in All Its Phases in the United States" and "Europe and Europe's Affairs" will be the two major topics considered at the eleventh annual meeting of the Chamber of Commerce of the United States in New York, May 7 to 10.

---

### Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Middle West Division, N. E. L. A.—St. Louis, April 11-12 H. M. Davis, Bankers' Life Bldg., Lincoln.

American Society of Mechanical Engineers—Pacific Coast meeting, Los Angeles, April 16-18; general convention, Montreal, May 28-31. C. W. Rice, 29 West 39th St., New York.

Tri-State Water and Light Association—Birmingham, April 17-20. W. F. Steiglitz, Columbia, S. C.

American Physical Society—Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

American Institute of Electrical Engineers—Spring convention, Pittsburgh, April 24-26; annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Sept. 25-28. F. L. Hutchinson, 33 West 39th St., New York.

American Welding Society — New York, April 25-28.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

Electrical Supply Jobbers' Association—Executive committee and general meeting, Hot Springs, Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

Missouri Association of Public Utilities—River boat from St. Louis to Peoria, May 24-26.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

North Central Division, N. E. L. A.—Minneapolis, June 13-15. H. E. Young, Minneapolis General Electric Company.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

Canadian Electrical Association — Montreal, June 20-23. Louis Kon, 65 McGill College Ave., Montreal.

American Society for Testing Materials—Atlantic City, June 25-29.

National Council Lighting Fixture Manufacturers—Hot Springs, Va., June 26-28.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13.

# Recent Court Decisions

**Intercorporate Relations and Extension of Service.**—Declaring that a public service corporation cannot minimize the duty it owes to the public by incorporating a portion of its distributing system, the New York Supreme Court held, in People ex rel. Woodhaven Gaslight Company vs. Nixon, that in considering the expense involved in an extension of gas service the New York Public Service Commission did right to consider the relation that existed between the company concerned and its parent company, which exercised absolute control over the defendant and three other distributing companies, and was not necessarily limited to a consideration of the expense with relation either to the capitalization or stated income of the relator. (196 N. Y. S. 623.)*

**Power to Enjoin Illegal Operation.**—The mere fact that a commission has no power to enforce its order cannot successfully be urged as a denial of the power to make the order when that power is expressly given it by statute, declared the Supreme Court of Califoria in reviewing an order of the California Railroad Commission requiring the Motor Transit Company to cease alleged illegal operation. As a practical matter of procedure, the court said, such an order is proper. If the order so given by the commission is obeyed, then no further legal steps are necessary. It is only when such order is disregarded that it becomes necessary for the commission to institute an action in the courts to secure its enforcement. Until such order is given there is no basis upon which the commission can ask the aid of the courts. (209 Pac. 586.)

**The Wisconsin Emergency-Rate Ruling.**—The decision of the Supreme Court of Wisconsin overthrowing the uniform rates established by the Railroad Commission for cities included in the "loop" district of the Wisconsin-Minnesota Light & Power Company led, as already recorded in the news columns of the ELECTRICAL WORLD, to the adoption of emergency rates by that company until such time as the commission can determine proper charges on the unit plan now made obligatory. The commission refused to recognize these rates, wishing to revert temporarily to the rates previous to the abortive establishment of the "loop" plan, but the United States District Court granted to the company an injunction restraining the commission from interference with the emergency rates adopted by the company for Eau Claire, Chippewa Falls and Menomonie. In granting the injunction the court said: "If this proceeding were to fix definitely a fair and reasonable rate, we would doubtless say the burden is upon the utility. But such is not the purpose of the present suit. The utility is seeking to avoid the effect of a confiscatory rate. With the confiscatory character of the rate established, are we not required, as between the municipalities and the utility, temporarily to adjust the rates so as to avoid confiscation? . . . We are not at all sanguine that the good-faith efforts of the commission to carry out the rule announced by the Supreme Court will result in any easy and prompt disposition of the case. Whether its final determination be speedy or long delayed, whether it result in a substantial change in rate or not, the utility should, pending such hearing, be protected against an obviously confiscatory rate."

**Protection of Crossing Wires.** — In Farne vs. Pennsylvania Lighting Company damages were awarded for the death of a telephone lineman caused by the breaking of a wire with which he was working and its coming into contact with both an electric light wire and a trolley wire. The Supreme Court of Pennsylvania reversed the award, holding that it had not been established that the electric light wires were insufficiently insulated, as claimed by the plaintiff, and that there was evidence that the telephone wire became charged from contact with the trolley wire. The court also found that plaintiff's claim that it was customary for electric service companies to provide a "cradle" at points where telephone lines crossed above the transmission wires in order to prevent contact should a telephone wire sag or break was not sufficiently sustained, and said that the primary cause of the accident was the subjection of the old, worn-out telephone wire to a strain greater than it could withstand. (119 At. 537.)

**Limited Power of Appellate Court Over Excessive Damages.**—Sustaining the verdict for plaintiff found by the trial court in Smith vs. San Joaquin Light & Power Corporation, the California District Court of Appeal held that where a seven-year-old boy grasped a live wire hanging from an electric light pole to within a foot or two of the ground near the side of a public highway on which he was walking, the company was liable for injury, even though the accident arose in connection with rewiring being done by an independent contractor and though the wire was broken by the leaves of a large palm being blown against it. It was the defendant's duty to protect its wires from such danger. The court refused to reduce the damages awarded for the forced amputation of the child's arm below the elbow — $20,000 — declaring that it had power over excessive damages only where a point of law was involved or where the damages suggested at first blush prejudice, passion or corruption on the part of the jury. A rehearing of this case was subsequently denied by the Supreme Court of the state. (211 Pac. 843.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Approval of Contract Cannot Waive Provisions of Law.**—In giving its approval to a contract for furnishing electrical energy entered into for three years between the Indiana Power Company and the city of Linton, the Indiana Public Service Commission took occasion to emphasize the mutual understanding of the commission, the city and the company that no contract or order could change the law applicable to public utility rates and service or waive the rights of the public.

**Extensions Into New Territory.**—In ordering the Springfield Gas & Electric Company to make an extension, under conditions, to serve an agricultural customer the Missouri Public Service Commission declared that an electric utility should not be required to add a new consumer to a line extended into new territory to serve other consumers who have contributed to the cost, have secured a right-of-way for their own personal service and have otherwise obligated themselves in connection with the extension, unless the additional applicant obligates himself to take service under the same conditions as the others.

**Service in Adjacent Territory.** — In adjudicating a complaint brought by the West Penn Power Company against the Vandergrift Electric Light & Power Company, the Pennsylvania Public Service Commission said that a public utility company incorporated for the purpose of supplying electricity to the public in a township and to "persons, partnerships, corporations and associations residing therein and adjacent thereto" cannot, under the adjacent-territory clause, extend its service beyond specifically designated territory into other adjoining municipal divisions in which another corporation is chartered to furnish a like service without a certificate of public convenience, even if "adjacent" persons is to be construed as meaning adjacent territory.

**North Dakota Commission Changes Opinion.** — Until quite recently the North Dakota Board of Railroad Commissioners had considered that historical costs have an almost controlling bearing upon a valuation, basing this opinion upon the requirement of the statutes that the value as determined by the commission "shall be such sum as represents as nearly as can be ascertained the money honestly and prudently invested in the property." Recently, in adjudicating a complaint brought against the Bismarck Water Supply Company, the commission announced that it had shifted its position, careful study of the authorities having convinced it that the words just quoted have a wider significance and a less restricted meaning than the actual number of dollars put into the property at its inception.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## G. N. Tidd Elected President American Gas & Electric

George N. Tidd, who has been associated with the American Gas & Electric Company for the last twelve years as vice-president and general manager in charge of operation, was elected president of the company at a meeting held March 14. Mr. Tidd is succeeding R. E. Breed, who was elected to the chairmanship of the board of directors. During the twelve years that Mr. Tidd served as vice-president and general manager the company attained a

G. N. TIDD

growth that ranks it with the foremost operating companies in the industry, and it was largely Mr. Tidd's foresight and courage that made possible the Windsor power plant of the Ohio Power Company, the first large power plant to be erected at the mouth of a coal mine. He has been a strong advocate of interconnections between large power systems, and under his management this policy has been pursued in Ohio. The latest example of his progressiveness is the 215,000-kw. plant of the Ohio Power Company on the Muskingum River below Zanesville which is now under construction.

S. Z. Mitchell was appointed chairman of the executive committee; Frank B. Ball, formerly secretary and treasurer, was elected vice-president and secretary, and F. W. Drager, formerly assistant treasurer, was elected treasurer.

**Gilbert Nerby** of North Menomonie has been appointed to succeed L. G. Webb, resigned, as district manager of the Menomonie office of the Wisconsin-Minnesota Light & Power Company. Mr. Nerby has been associated with the company for the last six years in the capacity of electrician. Mr. Webb, as was announced in the March 17 issue of the ELECTRICAL WORLD, tendered his resignation to enter into the real-estate business in Madison, Wis.

**Herbert Baker Flowers** has resigned as vice-president and general manager of the United Railways of Baltimore to become president of the New Orleans Public Service Corporation. Mr. Flowers became general manager of the United in 1919 and in 1920 was elected second vice-president of the company, continuing to discharge the functions of general manager.

**Charles G. Du Bois**, president of the Western Electric Company, accompanied by Vice-president H. F. Albright and Philip L. Thomson, advertising manager, sailed for Europe on the Aquitania on Tuesday, March 20. They plan to spend two months abroad, visiting the European factories and offices of the Western Electric Company.

**J. Rowland Bibbins**, formerly manager of the department of transportation, United States Chamber of Commerce, Washington, is now engaged in private consulting practice in transportation development, with offices in the same city. Previous to his association with the Chamber of Commerce Mr. Bibbins was supervising engineer with the Arnold Company of Chicago.

**Harry A. Arthur**, formerly of Stone & Webster, Inc., Boston, and the American International Corporation, New York, has been elected president of G. Amsinck & Company, Inc., of New York. Mr. Arthur was associated with Stone & Webster for more than ten years, spending much of that time in the field with electric light and power companies under Stone & Webster management. Ronald C. Shepard, formerly with the McGraw-Hill Publishing Company and prior to that with Stone & Webster, has been appointed vice-president and treasurer of the Amsinck company. During the world war Messrs. Arthur and Shepard were engaged in executive capacities with the American International Shipbuilding Corporation in the construction and operation of the Hog Island shipbuilding yards.

**H. U. Wallace** has been appointed assistant general manager of the Little Rock (Ark.) Railway & Electric Company. Mr. Wallace, who is well known in utility circles in the Middle West, has had an unusually active and interesting career. In 1894 he became identified with the Illinois Central Railroad and served as superintendent and chief engineer until 1905. Subsequently he followed private consulting engineering work and later became general manager of the Chicago, Lake Shore & South Bend Interurban. The year 1912 found Mr. Wallace at Boulder, Col., serving as vice-president and general manager of the Western Light & Power Company, where he remained until 1918, when he accepted an appointment as major in charge of engineering and construction, Quartermaster's Department, with headquarters at Washington, D. C. He left the army in the spring of 1919, and from that time until his recent appointment he was engaged in private practice.

## C. W. Bradley Assistant to President Budd

Charles W. Bradley of Chicago, gas engineer of the Public Service Company of Northern Illinois in charge of all gas plants, has been appointed assistant to President B. I. Budd of that com-

C. W. BRADLEY

pany. Mr. Bradley was born in 1873 and was graduated from Cornell University in 1896 in engineering. The following year he went to Chicago and became superintendent of stations for the old Chicago Gas Light & Coke Company, afterward consolidated with the present People's Gas Light & Coke Company. Mr. Bradley remained there until 1905, when he became gas engineer for the Northwestern Gas Light & Coke Company. When the last-named company was absorbed into the Public Service Company of Northern Illinois, in 1913, Mr. Bradley came into the latter organization.

**Prof. Lester P. Breckenridge**, chairman of the department of mechanical engineering at Yale University, will retire from active teaching in June. Professor Breckenridge went to Yale from the University of Illinois fourteen years ago. He was graduated from the Sheffield Scientific School in 1881. Professor Breckenridge was at one time in charge of the boiler division, U. S. Geological Survey, fuel testing plant, St. Louis and he has written a number of bulletins on fuel conservation.

## R. U. Muffley Washington Coast Utilities Manager

R. U. Muffley, formerly superintendent of light and power of the Bellingham division of the Puget Sound Power & Light Company, has been named manager of the Washington Coast Utilities properties recently acquired by the company first named. The properties of the Washington Coast Utilities, comprising seven electric, gas, water and telephone companies, will be operated as a separate unit for the present, under the direction of Mr. Muffley. His first work in the utility field was with the Fairmont Electric Light Company of Minnesota, back in 1899. In 1903 he went to the Pacific Coast and took a position with the Globe Electric Company, and in the following year he became affiliated with the organization of the Whatcom County Railway & Light Company. This company absorbed the electric properties of the Bellingham Bay Improvement Company in 1906, and in 1908 Mr. Muffley was named superintendent of distribution. In 1911 he was promoted to the position of superintendent of light and power in charge of all light and power plants, street-railway lines and a gas plant owned by the company, which position he held until his recent transfer to the post of manager of the Washington Coast Utilities Properties. C. F. Terrell of the Seattle division has succeeded Mr. Muffley at Bellingham.

R. U. MUFFLEY

**Chase Donaldson**, formerly appraisal engineer with the American Gas & Electric Company, has resigned and is now an investigator for security issues with Hayden, Stone & Company, New York City.

**J. T. Fulwiler**, formerly connected with the Western Electric Company in Atlanta, Savannah and New Orleans, is now representing J. H. Parker & Son, Inc., Parkersburg, W. Va., throughout Arkansas, Oklahoma, Texas, New Mexico and Louisiana, with headquarters in Dallas, Tex.

**C. E. Chapple** is now chairman of the Fort William (Ont.) Light, Telephone & Street Railway System, replacing Charles Birkett.

**Albert Uhl**, formerly connected with the Henry Newgard Company as sales engineer, has joined the Nordlie Electric Company, Chicago.

**Harvey Clark Pond**, general sales manager of the Arrow Electric Company, Hartford, Conn., has been elected a member of the board of directors.

**E. A. Graham**, formerly connected with the Electric Bond & Share Company, New York City, has gone to Cienfuegos, Cuba, where he will be with the Compañia Electrica de Cienfuegos.

**A. H. Favreau** has replaced George W. Cook as superintendent of the Southern Illinois Railway & Power Company, Harrisburg, Ill. Fred L. Shimer has been made general superintendent and M. H. Wetlaw has been appointed as general agent.

**Paul P. Ashworth**, distribution engineer of the Utah Power & Light Company, has been unanimously re-elected to represent the Utah Section of the American Institute of Electrical Engineers on the governing board of the Engineering Council of Utah. His term of office will expire Jan. 1, 1925.

**R. J. S. Pigott**, formerly connected with the Crosby Steam Gage & Valve Company of Boston, as works manager, has recently become associated with Stevens & Wood, Inc., as mechanical engineer in charge of all the power and industrial work of the company. Mr. Pigott has been retained by the Boston company in a consulting capacity.

**C. V. Woodward** has been appointed manager of the Baltimore office of the Westinghouse Electric & Manufacturing Company, and F. C. Reed has been made manager of the Huntington (W. Va.) office. Other changes in the branch offices include the appointment of R. J. Ross as assistant manager of the transportation division of the Philadelphia office and of W. F. James to the managership of the industrial division, succeeding R. F. Moon, who has resigned to accept the vice-presidency of the Atlantic Elevator Company of New York.

**Kenneth V. Laird** has been placed in charge of a new department recently organized by the Capital Electric Company of Salt Lake City, Utah, which covers Utah, southern Idaho and parts of Nevada and Wyoming as an electrical jobber. This department is to be known as the transmission and street lighting department and has been organized for the purpose of affording technical service to customers in the working out of their problems. Mr. Laird is a graduate in electrical engineering of the University of California with the class of 1914. Prior to the war he was a member of the staff of the Anaconda Copper Mining Company in connection with the Cottrell process. More lately he was electrical engineer for the Gillert Engineering Company of Philadelphia.

## Dr. Merrill Heads Engineering Council of Utah

Dr. Joseph Merrill, dean of the Engineering College of the University of Utah, has been elected president of the Engineering Council of Utah. He has been active in the organization of the Engineering Council, which is an affiliation of all of the engineering societies of Utah, representing about fifteen hundred men of the engineering profession. Dr. Merrill received his bachelor of science degree from the University of Michigan in 1893 and continued his studies at the Johns Hopkins University, receiving his Ph.D. from that institution in 1899. He was assistant professor of chemistry at the University of Utah in 1897, director of the Utah State School of Mines at the University of Utah in 1898, and since 1899 has been professor of physics and electrical engineering of that institution.

JOSEPH MERRILL

Dr. Merrill has done extensive research work in electrical engineering. He has been very active in the Utah Section of the American Institute of Electrical Engineers and served as chairman of that section during the association year 1920-1921.

# Obituary

**Henry H. Ashley**, president of the Hazard Manufacturing Company, manufacturing cable at Wilkes-Barre, Pa., died recently.

**Alexander Lodyguine**, inventor of many electrical and chemical processes, died on March 16 at the Brooklyn Hospital after a long illness. Mr. Lodyguine, who was seventy-five years old, was a member of the American Institute of Electrical Engineers and of the American Electrochemical Society. Among his inventions were a carbon incandescent lamp, a flying torpedo, electrical heating and hardening furnaces, a storage battery and chemical apparatus.

# Manufacturing and Markets

Devoted to the Discussion of Business and Economic Problems of the Producer and Distributor, with Market Reports, Trade Activities, Foreign and Construction News

## Stabilizing the Sale of Commodities*

**Reasons for Favorable Merchandising Outlook—Quality Versus Price as a Trade Factor—Incentives to Sales Effort**

By A. G. Kimball
President Landers, Frary & Clark, New Britain, Conn.

OUT of the war and the subsequent short period of depression has come a new prosperity which presents a great opportunity for every one in the merchandising field and especially to those engaged in marketing household conveniences. Prohibition, the servant problem and the modern woman are primary factors in the development of electrical merchandise sales.

A great deal of the money formerly spent for the "fifty-seven varieties of liquid joy" is now available for home conveniences. A greater percentage of the family income than formerly is now expended by women in the homes of the country, and even among conservative people much more entertaining is done than in years past. There is increased interest in the appointments, conveniences and luxuries of home life, with a tendency toward the purchase of more refinements of living, which all together make a considerable market for electrical products that previously did not exist.

From all indications the scarcity of servants will continue many years. The desire for individual freedom, unwillingness to perform "menial" service, the demand for stated hours of work, and shorter hours at that, combined with unwillingness to tie one's self down, contribute to the shortage of domestic help. Competent servants are hard to obtain and insist on modern conveniences as a condition for remaining.

Women are now performing household tasks who would not have thought of this work ten years ago. The demand for household conveniences grows apace. *Electrical Merchandising's* forecast of household sales prospects in electrical appliances has exceeded the estimates of manufacturers and yet has been found accurate in the light of past experience. This journal estimates that in 1923 $160,000,000 will be expended in this country for electrical household devices and conveniences. A building boom is in progress throughout the country. Manufacturers of builders' hardware cannot keep up with orders. All new homes are potential customers of the electrical industry. It is estimated that the number of wired homes in the United States will increase from six and one-half million in 1921 to eleven million by 1924—virtually doubling the number having electric service.

### Let the Central Station Back "Quality" Products

Each newly wired home means a new customer for the central station. The central station has in its tie-in with its customers an advantage comparable to that of the department store with its "charge accounts." Twenty million establishments in this country are engaged in the housekeeping business. In reaching out into this potential market for the sale of electrical devices the central-station company has the best opportunity possessed by any branch of the industry.

It is generally true that where a central station is actively merchandising in a community it creates more business than formerly existed there in the appliance field for every one engaged in the local supply of electrical commodities, provided that the central station maintains a proper policy. It is to the interest of the entire industry that list prices be maintained, although sales stimulation of one kind or another is favored on occasion. Special sales are desirable once in a while—every woman loves a bargain—as in department store merchandising, but these special sales should prevail for a limited period only, with reductions on the cheaper brands of goods and the maintenance of profits on regular lines.

The department store has studied every phase of the merchandising problem and worked out its plans, analyzing the details of buying, selling and service. The electrical industry needs to do the same thing. The question of turnover, for example, needs more thorough consideration.

As electrical manufacturers, we believe it is a mistake for merchandisers to buy of all producers of electrical commodities. It is better to feature one or two brands, to be headquarters in a community for particular products. More business is done than in cases where the retailer handles a big variety of goods. Fewer "frozen" stocks or sacrifice sales develop under a policy of concentration, which means more incentive for the manufacturer and jobber to co-operate with the dealer who does not attempt to cover too great a variety of lines.

It is a temptation for the buyer to "fall for" some of the bargains offered by relatively unknown producers, and so a policy of concentration leads to the creation of fewer choked-up stocks.

### Cheaper Merchandise Threatens Market

As a result of the expiration of the Marsh patent a decided tendency toward the production of lower-grade merchandise can be seen and central stations and other retailers will make a mistake if they buy from cheaper producers who sacrifice quality to price. Business cannot be built up on price, and there is going to be a real battle between price and quality in electrical merchandising. The manufacturer's reputation is the best guarantee of the appliance.

What should the central station do to go after this business in an aggressive manner? Some one with real merchandising ability and instincts should be put in charge of this end of the business. Too often in the past a purely technical man has been in charge of sales activities.

*From an address before the Merchandising Bureau, New England Division, N. E. L. A., at Hartford, Conn., March 14, 1923.

A vital question is how to keep such employees. Some plan should be worked out so that the merchandising man may in some way be made a partner in this business, as on a salary and bonus basis. In the past too much emphasis has been placed on the lighting load as a revenue producer. There is a far greater opportunity in appliances. If all central stations could be given the name "The Blank Electric Company," it would facilitate the sales activities of the industry. Try to serve the public when people enter the utility office. Don't permit any employee to "bark" at the public. Things jar in a public utility that would never be given a second thought in private industry.

A courteous and intelligent person at or near the door is essential. In general, manufacturers stand ready to co-operate to the utmost in developing the merchandising field in the electrical industry, which offers tremendous opportunities for progressive organizations.

# Police Power Needed in Maintaining Quality

### Devices Sold for Use in the Home Should Be Protected by an Approval from the Central-Station Industry that Each Utility Could Enforce

By S. D. Levings
Treasurer Betts Electric & Manufacturing Corporation, New York

SOMETHING definite and positive should be done to protect the purchasing public against electrical devices of inferior quality. The Underwriters' Laboratories are not vested with the police power that would enable them to eradicate from the market cheap and hazardous devices. They afford purely a moral protection for the insurance company and the insured, and it is a well-known fact that very few fires occur in homes employing non-approved apparatus, where the insurance companies refuse for that reason to pay the loss covered by the policy. The question therefore is: Could an organization established by the central-station companies themselves exert the power the underwriters do not possess by disseminating information on approved apparatus through the central stations direct to the consumer?

#### Effect on the Trade

It may be said that this is not the function of a public utility. But surely it would protect the public and improve the service and so would be in the public interest. I believe that it would be effective because a strong influence would be exerted if the consumer were to receive regularly with his bill a list of apparatus that was approved with a statement that the central station could not be held responsible for trouble or improper functioning of the service if devices other than those approved should be used.

Such an approval should not tend to uphold the big manufacturer in opposition to the smaller manufacturer, for there are many smaller concerns that manufacture electrical apparatus superior in quality, workmanship and functioning to that made by some of the larger manufacturers; but it should influence the jobber and the dealer in their purchasing.

The dealer buys generally on one or two bases—that of his own judgment, based on first-hand information, or that of judgment based upon sales effort directed to him on the part of the manufacturer. With two articles side by side of known quality, he will buy the low-priced, which generally is of inferior quality, unless the higher-priced article has been so extensively advertised by the manufacturer as to create a demand from which the dealer can automatically benefit. The jobber buys an article for which there is a demand, and the manufacturer who cheapens his product to spend the savings in advertising can certainly make headway against a manufacturer of a high-grade article who does not possess a large enough advertising appropriation to compete with him.

But in approving a device all such aspects should be eliminated from consideration. The only question to be determined would be the suitability of a device for use by the novice, and I would further eliminate any apparatus not sold at retail to the householder. Thus, I do not believe it would be necessary to pass upon fixtures, conduit, conduit fittings, wire, switches and similar things, as the standards on this class of goods are pretty well recognized and a manufacturer who cannot live up to the building code requirements, the various underwriters' rules and local ordinances has little chance of doing much damage.

I have in mind a specific accessory device, a double socket. The body of the plug is made of bakelite, the best insulation obtainable. There is no porcelain in any part of its construction to cause trouble through breakage. There are no internal connections of any kind. Brass shells are eliminated. There is a spring contact at every point. Purely on the technical merits, it is clear that the absence of fragile porcelain parts is a distinct advantage to the consumer. The elimination of soldered connections, which are only as good as the workman who makes them and which are liable to open on overloads and to cause high-resistance joints, is a decided advantage. Trouble due to arcing contacts in sockets with solid connections are avoided because there is not a solid contact in this plug.

Now, it would seem that every electrical man of experience would wish to adopt this device. The manufacturer has been told on all sides that he has a wonderful article but that, inasmuch as he has not created a demand, purchasers of two-way sockets will not become interested. I know of no more striking illustration of the lack of appreciation on the part of the trade of quality for the sake of quality.

#### Where the People Look

The indorsement of such institutions and periodicals as the Tribune Institute, *Good Housekeeping* and the *Modern Priscilla* is of value and interest, but the public certainly does not look to such organizations for technical electrical advice. It naturally looks to the central stations for such information.

I do not believe that it would be a difficult matter to test or to arrive at a method of analyzing the quality of the various devices used in the home. As a matter of fact, I believe that a specification for general points of construction and performance should be written for each type of such devices and that their testing should be made in strict accordance with such specifications.

I feel that the time is coming when the central-station companies will have to take a firm stand in the matter of the quality of apparatus

that is to be attached to their lines; and as no one station could stand the burden of the work involved, it appears as though a concerted effort would be necessary, with a common fund to carry on the work in a scientific and proper manner. I agree that it would be folly to put this work in the hands of any but the central stations. Certainly they cannot be accused of bias.

The whole object of the idea would be to protect the patrons of the utilities, who expect and are entitled not only to electric service but to service in a broader sense in all that pertains to their use of energy.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## January Electrical Exports Show Gain

Total exports of electrical machinery, apparatus and appurtenances for the month of January were $6,400,943, a gain of $1,587,199 over January, 1922, when the total amounted to $4,813,744. The following figures are supplied by the Bureau of Foreign and Domestic Commerce:

ELECTRICAL EXPORTS FOR JANUARY, 1923, COMPARED WITH CORRESPONDING PERIOD A YEAR AGO

| Articles | Value — January 1922 | Value — January 1923 |
|---|---|---|
| Turbines | $202,304 | $175,111 |
| Generators: | | |
| Direct-current— | | |
| Under 500 kw | 42,505 | 60,374 |
| 500 kw. and over | 169,675 | 130,406 |
| Alternating-current— | | |
| Under 2,000 kva | 4,952 | 19,819 |
| 2,000 kva. and over | 79,876 | 99,890 |
| Accessories and parts for generators | 250,605 | 90,108 |
| Self-contained lighting outfits | 39,776 | 66,246 |
| Batteries: | | |
| Primary | 74,126 | 97,324 |
| Storage | 51,701 | 221,721 |
| Transforming and converting apparatus: | | |
| Transformers— | | |
| Power | 83,953 | 192,153 |
| Other | 106,633 | 35,471 |
| Rectifiers, condensers, double-current and motor generators, dynamotors, synchronous and other converters | 67,872 | 53,701 |
| Transmission and distribution apparatus: | | |
| Switchboard panels, except telephones | 44,766 | 132,168 |
| Switches and circuit breakers above 10 amp | 175,382 | 220,987 |
| Fuses and fuse blocks | 13,259 | 17,898 |
| Meters and measuring instruments: | | |
| Watt-hour and other measuring instruments | 66,116 | 19,184 |
| Volt, watt and ampere meters and other recording indicating and testing apparatus | 68,006 | 64,859 |
| Lightning arresters, choke coils, reactors, and other protective devices | 14,230 | 48,149 |
| Motors, starters and controllers: | | |
| Motors under 1 hp | 36,146 | 73,112 |
| Stationary motors, 1 to 200 hp | 146,523 | 193,386 |
| Stationary motors over 200 hp | 3,681 | 45,087 |
| Railway motors | 390 | 21,995 |
| Electric locomotives— | | |
| Railway | 17,505 | 874,739 |
| Mining and industrial | 8,926 | 6,170 |
| Other motors | 65,563 | 7,023 |
| Rheostats, controllers and other starting and controlling equipment | 73,501 | 116,270 |
| Accessories and parts for motors | 146,521 | 100,696 |
| Electrical appliances, etc: | | |
| Electric fans | 46,395 | 48,972 |
| Electric lamps: | | |
| Incandescent— | | |
| Carbon-filament | 3,050 | 3,357 |
| Metal-filament | 95,057 | 82,541 |
| Other electric lamps | 17,350 | 18,142 |
| Flashlights | 14,855 | 27,450 |
| Searchlights and projectors | 140,040 | 38,557 |
| Motor-driven household devices | 22,704 | 46,970 |
| Domestic heating and cooking devices | 38,540 | 55,989 |
| Industrial electric furnaces and ovens | 22,951 | 8,960 |
| Therapeutic apparatus, X-ray machines, galvanic and faradic batteries, etc | 41,703 | 34,229 |
| Signal and communication devices: | | |
| Radio and wireless apparatus | 9,274 | 141,577 |
| Telegraph apparatus | 25,380 | 392,992 |
| Magneto telephones | * | 490 |
| Other telephones | 370,055 | 28,467 |
| Magneto switchboards | * | 20,242 |
| Other telephone switchboards | * | 18,125 |
| Railway signals, switches and attachments | 45,901 | 32,616 |
| Bells, buzzers, annunciators and alarms | 4,043 | 6,032 |
| Other electrical apparatus and appurtenances: | | |
| Spark plugs, magnetos, and other ignition apparatus | 104,311 | 68,055 |
| Insulating material | 56,498 | 66,828 |
| Metal conduit, outlet and switch boxes | 53,655 | 16,089 |
| Sockets, receptacles and lighting switches | 10,738 | 68,589 |
| Other wiring supplies and fixtures | 79,375 | 153,108 |
| Other electrical apparatus not elsewhere specified | 838,313 | 804,528 |
| Globes and shades for lighting fixtures | 35,272 | 27,235 |
| Electrical glassware, except for lighting | 12,082 | 15,332 |
| Electrical porcelain | 103,923 | 138,134 |
| Electrical carbons, carbon brushes and electrodes | 19,543 | 146,938 |
| Insulated wire and cable (iron and steel) | 80,618 | 68,237 |
| Other manufactures of aluminum | 40,602 | 53,395 |
| Copper: | | |
| Bare wire | 64,486 | 212,282 |
| Insulated wire and cable | 234,537 | 209,508 |
| Total electrical exports | $4,813,744 | $,400,943 |

* Not separately stated prior to Jan. 1, 1923.

## Aluminum Output Gained 25 per Cent in 1922

The value of new aluminum produced in the United States during the year 1922, according to the United States Geological Survey, was $13,622,000, an increase of about 25 per cent over 1921. During the first half of the year the price was 20 cents a pound. In September, when the tariff went into effect, the price advanced to 23 cents, where it remained until the end of the year. The price is now 26 cents.

Imports for the first nine months of the year amounted to 31,482,893 lb., compared with 26,177,852 lb. for the corresponding period in 1921. Value of manufactured articles of aluminum during the same period was $1,486,177, compared with $1,635,106 imported during the first nine months of 1921. Figures for the last three months of 1922 are not yet available.

## Atlanta Collections Improving

Collections in the Atlanta district showed little change during last month, and jobbers reported their collections quite satisfactory. There is still some tendency toward slowness by the small contractors, but even this element is showing signs of increasing promptness. Industrial companies and public utilities are liquidating their accounts more promptly, and jobbers report that credit is easier and more liberal than has been the case for some time past as they anticipate excellent conditions later in the spring. Money continues easy, as is evidenced by the heavy building activities throughout the territory.

## The Metal Market

### No Sign of Weakening Price—Export Market Quiet—February Shipments 180,000,000 Lb.

Practically all producers continue to hold their copper at 17 cents delivered. There is no sign among most producers of weakening on this quotation, and, being well sold up, they seem willing to wait two or three weeks if necessary for the demand to reassert itself. The export market has been more quiet than usual, at prices that have netted producers approximately the same as domestic business.

Foreign and domestic shipments of copper during February totaled 180,000,000 lb. With allowance for the shorter month and holidays in February, this figure maintained the same high rate as in January, when the largest shipments in the peace-time history of the industry were made, totaling 210,000,000 lb. Refining output during February amounted to about 160,000,000 lb., resulting in reduction of refined stocks by 20,000,000 lb. On March 1 these stocks totaled 255,000,000 lb., compared with 275,000,000 lb. on Feb. 1. Indications point to the shipment of a total of 225,000,000 lb. in March.

NEW YORK METAL MARKET PRICES

| | Mar. 14, 1923 Cents per Pound | Mar. 21, 1923 Cents per Pound |
|---|---|---|
| Copper | | |
| Electrolytic | 16.75 | 17.00 |
| Lead, Am. S. & R. price | 8.15 | 8.25 |
| Antimony | 8.75 | 8.75 |
| Nickel, ingot | 30.00 | 30.00 |
| Zinc, spot | 7.50 | 7.50 |
| Tin, Straits | 46.00 | 47.25 |
| Aluminum, 98 to 99 per cent | 25.50 | 26.00 |

# The Week in Trade

Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points

SLIGHT improvement in orders throughout the United States is noticeable following buying on the rising market for porcelain, copper and brass products after decided rises in raw materials during the greater part of the last four weeks. Along the Pacific Coast the demand for rubber-covered wire, which was marked up 2 per cent last week, has slowed up owing to the heavy stocks now in the hands of the contractor-dealers, who bought far in advance in anticipation of higher prices. In that territory the conduit situation is unimproved, deliveries are slow, and factories will accept orders subject to price on date of shipment. In the South electrical business is experiencing a wholesome demand as excellent weather conditions have permitted building activities to go ahead rapidly. In the Middle West industrial-equipment sales of commodities to the utilities are growing with stiffening prices. Other business incident to newly constructed buildings is, however, delayed to some extent by labor difficulties. In the East business continues very active, with some improvement in the delivery situation, although railroad embargoes are still bothering shipments of raw materials. In New England there is talk of strikes in the textile industry. Radio sales are well maintained and appliances are receiving unusual attention for this time of the year. Collections generally are much improved.

**Boston** Business continues very active, and there is moderate improvement in the delivery situation, although railroad embargoes are widespread. Building contracts awarded in New England for the week ended March 13 totaled $4,654,200, against $3,974,100 for the same week last year. A deadlock in the building industry at Boston regarding wage increases has caused cancellations of contracts exceeding $2,000,000, and it is not unlikely that a struggle to establish the open shop may occur this spring. Strikes threaten the textile industry at Fall River and New Bedford, Mass. Important new central-station construction is contemplated at Worcester, Mass., and Providence, R. I. Spring demand is opening in line material and appliance sales are showing up well. New England electrical factories are extremely busy.

**New York** Prices all through the copper and brass lines continue strong, following rises in the raw-material market. Insulators, poles and meters are moving in greater volume to the utilities, and wiring devices, fixtures and appliances are receiving more interest than one month ago. Electrical manufacturers throughout this territory are very busy filling spring and summer orders and are having less difficulty in obtaining raw materials from the inland. Heater sales during the last three months have been far in excess of any like period of three years back as a result of intensive sales efforts in the form of newspaper advertising, more attractive displays and the coal shortage. Business in second-hand motors is said to be more brisk than two weeks ago.

**Baltimore** General market conditions are holding their own, with very good prospects for the late spring and summer seasons. There is but small demand for flatirons and a good many of the jobbers are understocked. Motors and transformers are keeping steady and wire has had an active week.

**Atlanta** Business in electrical lines is increasing steadily. Excellent weather conditions have permitted building activities to go ahead rapidly and a healthy demand is to be noted in all electrical building materials. Irons are selling briskly. One jobber is in the midst of a statewide campaign and reports excellent results with ample stocks to meet the demand. Another jobber anticipates sales campaigns beginning April 1. Demand for batteries of all types continues active and sales are considerably in excess of the same time last year. The outlook in this line is bright, and satisfactory stocks and firm prices are the rule.

**Pittsburgh** Jobbers report fair business from utilities and industrials. The price trend in practically all commodities in this territory is upward, and yet business seems to be getting stronger as each week goes by. Radio shows a marked improvement, and, as previously reported, people demand a better class of equipment than ever before. Business among the building trades continues to improve.

**Cleveland** General business conditions are much improved. Construction is delayed somewhat by labor difficulties, although builders' plans included an extensive program for spring. Conduit stocks are low and also tend to hamper building operations to some degree. Industrial equipment sales are good, and prices of pole-line hardware, wiring devices, armored cable and high-tension equipment are stiffening. Deliveries are lengthening again, although railroads report their rolling stock to be greater. Appliances are in very good demand, particular strength in cleaners being noticed. Central stations report power sales increasing and meters are in good demand. Radio prices are declining, although sales are active. Collections are reported as improved.

**Chicago** Demand for staples, including wire, switches and wiring devices, is continuing firmly. Stocks are normal with the exception of conduit and porcelain. The call for motors is growing and more apprehension is given to the scheduling of shipments than to the cost of motors, which has remained firm. Demand for poles remains active and stocks are fairly normal with firm prices. Call for radio is steady and stocks are normal with the exception of a few commodities, including the 1.5-volt vacuum tube. The tape market has noticed no fluctuations, since both the rubber and the cotton grade have a steady call.

**St. Paul-Minneapolis** The extreme cold weather during the last few days has stopped construction and all outside work has slowed up considerably. Dealers are ordering from hand to mouth. Wire is still going up. The conduit situation is very serious, with acute shortages in small sizes. Radio has slowed up.

**Denver** Increased prices of electrical materials dependent on copper and steel are not uniform, and, because of the uncertain market, no heavy buying for stock is being done. Central-station buying is consistent and indicative of considerable activity later. Jobbers report improvement in stocks, but in several lines, owing to the large demand, manufacturers are making short shipments. Wire stocks, however, are ample, while larger sizes of conduit are short. Recent blizzards have impaired all transmission lines, but no serious damage has been reported. Range makers are surveying territory closely for development of electric cookery campaigns. Appliance sales are picking up.

**St. Louis** Production and distribution of merchandise in this district for the past month have been relatively larger in volume than is usual at this season of the year and have shown large gains over the corresponding period of the two preceding years. Practically all building materials have increased in price. Wholesalers report that their customers are taking advantage of prompt payment discounts to a greater extent than they have done for more than two years. Dealers in electrical appliances report large sales, all lines showing an increase over last year.

**Portland-Seattle** Lumber production reached a new high post-war peak last week. Increased lumber prices are reflected in higher prices for poles and cross-arms. Deliveries on cross-arms are very slow owing to the greatly increased demand. A 2 per cent increase in rubber cov-

# Demand, Supply and Price Trend of Nineteen Commodities as Sold in Sixteen Cities

ered wire is reported. Demand for this wire has slackened somewhat owing to heavy stocks recently purchased by contractor-dealers in anticipation of a rising market. The conduit situation is unimproved. Deliveries are slow and factories will accept orders only subject to price on date of shipment. Since the expiration of the patent rights on resistor wires, inferior irons have appeared on the market. Jobbers are preparing for this competitive situation by handling a second-grade iron, which is good but not so expensive as the standard lines. Sockets and snap switches have advanced about 7 per cent. Credits are freer except in the contractor-dealer class. Collections have slowed up materially, the average length of time for outstanding accounts in the Northwest for February being fifty-seven days.

## Salt Lake City

The mining industry has recovered something of its old-time prosperity, five silver-lead mines alone depositing $600,000 each month in Salt Lake City banks from net earnings. The wool industry is also well stabilized, prices being at a high level. Sugar-beet growers continue to get bonus money on their 1922 crop as sugar prices tend upward. It is predicted that a building boom, unprecedented in Utah's history, will be launched this spring. Merchandise generally is moving better. Collections are much improved.

## San Franeiseo

California jobbers have cautioned their salesmen to watch all quotations and delivery promises because of changing markets, shortages of labor and raw materials in the East. Many large orders have been reported, this being a season of annual requirement purchases, such as eleven cars of fiber conduit, about $100,000 worth of paper cable for underground work in San Francisco and nearly 500,000 ft. of rubber-covered wire for overseas shipment. It is reported that electrical work in the new government tubercular and service sanitarium will amount to approximately $150,000. Radio business is improving steadily. Better broadcasting service is largely responsible for this.

Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## G. E. Erie Works to Make Same Type Transformers as Built at Pittsfield

To care for the increased transformer business of the General Electric Company, it is announced that arrangements have been made for the Erie works of the company to manufacture transformers of the same type as those built at the Pittsfield works. It is expected that production will be started some time next month.

Erie-built transformers will be manufactured along the engineering lines directed from the Pittsfield works. They will average in sizes from 1,000 kw. to 5,000 kw. in capacity and will be for voltage as high as 66,000.

## Anaconda Copper Advances Wages

The Anaconda Copper Mining Company has advanced miners' wages in the Butte district 50 cents a day, according to an announcement made last week. This is not the first advance in miners' wages announced in the copper industry since the beginning of the year, but it is the first action to be taken by one of the larger companies. It is expected that the advance by Anaconda will force other companies to announce a similar increase.

## Marshall Moves to St. Louis

The Marshall Electric Company, Chicago, originator of the Marshall system of constant-potential charging for storage batteries, will move its offices to St. Louis March 26. It will occupy the second floor at 3225 Locust Street. Harry B. Marshall is president, D. P. Ruger vice-president, and Thomas Marshall treasurer.

## Form Electric Club of Brooklyn

The Electric Club of Brooklyn has been incorporated with offices at 503 Myrtle Avenue, Brooklyn, N. Y. W. J. Shannon is president, D. M. Carr is vice-president, H. W. Bishop is treasurer, and A. Stone is secretary.

According to an announcement issued by the new club, its purposes are: "To foster trade or commerce for the interests of those having a trade, business, financial or professional interest in the electrical industry; to reform abuses relative thereto, and to secure freedom from unjust or unlawful exactions; to diffuse accurate and reliable information as to the standing of merchants or other matters; to procure uniformity and certainty in the customs and usage of trade and commerce and of those having a trade, business, financial or professional interest in the electrical industry; to settle differences between members, to promote a more enlarged and friendly intercourse between business in the electrical industry, and to enjoy as a corporation every right and privilege whatsoever to the fullest extent, pursuant to and in conformity with the acts of the Legislature of the State of New York relating to membership corporations."

## Torrington Company's Changes in New York

The Torrington Company, Torrington, Conn., has opened up a Torrington shop at 9-11 East Thirty-seventh Street, New York City, which will also be the headquarters for its New York sales office, its Eastern division sales headquarters and its general sales office for the entire vacuum-cleaner business, which is in charge of C. M. Bunnell as general sales manager.

## Charter Purchases Mietz Oil Engine Business

The Charter Gas Engine Company, Sterling, Ill., announces the purchase of the entire "Mietz" oil engine (also known as "Mietz & Weiss") business, heretofore carried on at 128 Mott Street and 430 East Nineteenth Street, New York City, by the August Mietz Corporation and the Reliance Oil Engine Corporation. This effects a merger and consolidation, under one management, of two of the oldest internal combustion engines in the world.

The "Mietz" oil engine was the pioneer semi-Diesel oil engine of the world. The first "Mietz" oil engine was built in 1895 by Mietz & Weiss, and since that time there has been placed in service about 375,000 hp. in all parts of the world.

The Charter Gas Engine Company is now moving from New York City to its plant at Sterling all of the physical assets comprising the "Mietz" engine and in the meantime is filling repair orders from New York City, so that there will be no interruption in repair service to "Mietz" engine users.

## Despatch Appoints J. R. Eves

The Despatch Manufacturing Company, Minneapolis, manufacturer of electric ovens, has appointed J. R. Eves as its heating specialist and engineer to serve as the district manager in the Buffalo territory, at 81 Eighteenth Street.

## Mine & Smelter Appointment

M. H. Carpenter, former manager of the San Francisco branch of the Mine & Smelter Supply Company, El Paso, Tex., electrical apparatus and supplies, has been appointed El Paso manager and will assume his new duties on April 1. Mr. Carpenter is well known to the mining trade of the West, having been with the Mine & Smelter firm for a number of years.

## Benjamin Electric Sales Gain 25 per Cent

The 1922 financial report of the Benjamin Electric Manufacturing Company, Chicago, showed the improved condition of the company over 1921. The balance for Dec. 31, 1922, totaled $272,317.64, while that of Jan. 2, 1922, was $122,390.64.

President R. B. Benjamin's report said in part: "There was a marked improvement in business activity during 1922, sales for the year showing an increase of more than 25 per cent over those of 1921, which resulted in a net profit for the company of $203,723.94. This compares with a loss in 1921 of $643,374.38, largely due to depreciation of inventory. During the year our 8 per cent five-year serial gold notes were amortized by the sale of $1,500,000 6 per cent first-mortgage fifteen-year sinking-fund gold bonds, thus lowering the high interest rate and burdensome maturities." The surplus accounts for the year 1922 are as shown in the accompanying table.

| | | |
|---|---|---|
| Balance—Jan. 2, 1922 | | $122,390.64 |
| Add: Profits for year | | 203,723.94 |
| | | $326,114.58 |
| Deduct: Dividends paid and accrued—first preferred | $48,650.00 | |
| Federal taxes paid | 2,040.00 | |
| Sundry adjustments | 3,106.94 | |
| | | 53,796.94 |
| Balance, Dec. 31, 1922 | | $272,317.64 |

## Standard Underground Cable Will Move to New Building in April

The Standard Underground Cable Company will move its general offices and Pittsburgh sales office from the Westinghouse Building, where it has been established for many years, to the company's new factory and office building at 100-108 Seventeenth Street early in April.

The new building is a four-story, brick-and-steel structure just completed and occupying the entire block between Sixteenth and Seventeenth Streets. This block was the site of the company's first factory, erected in 1883.

The Standard Underground Cable Company also announces the opening of a branch of its St. Louis sales office in the Scarritt Arcade Building, 817-819 Walnut Street, Kansas City. E. H. Shutt, who has been with the com-

pany for several years, will be in charge of the new office as district sales agent.

### Order for 2,000 Distribution Transformers Goes to Westinghouse

The Southern California Edison Company has placed with the Westinghouse Electric & Manufacturing Company an order for 2,000 distribution transformers, amounting to approximately half a million dollars. The size of the contract, which is one of the largest ever placed for such apparatus, can be estimated by the fact that there are more than thirty carloads of transformers in the order.

The transformers are to be used mainly for supplying power for motors for irrigating farm lands in southern California. This part of the state is dependent for practically all of its water supply upon wells, from which the water is pumped by electricity and distributed over the land in irrigation ditches, and for this reason the Southern California Edison Company is carrying out an extensive developmen of distribution lines throughout the territory which it serves.

### Gibb Opens Cleveland Office

The Gibb Instrument Company, Bay City, Mich., manufacturer of electric equipment, has opened a sales office in Cleveland, at 2104 East Superior Avenue, which will be in charge of W. O. Little.

### Storage Battery Firms Report $6,921,195 Profit from Sales

The Electric Storage Battery Company and the Willard Storage Battery Company, Philadelphia, in their consolidated balance sheet as of Dec. 31, 1922, show gross sales, less cost of manufacture, including all expenses incident thereto, of $11,966,681. Selling, administrative and general expenses, including salaries, commissions, engineering and branch office expenses, were $5,045,486. Profit from sales amounted to $6,921,195, and other income, $649,644. The listed profit before allowance for federal income tax was $7,570,834. Dividends paid during the year 1922 amounted to $3,196,685. The federal income tax for the year 1922 is estimated at $885,000.

### Federal Electric's Gross Earnings Gained $657,994

For 1922 the Federal Electric Company, Inc., Chicago, showed a gain in gross earnings over 1921 of $657,994. The total income from all sources during 1922 was $4,997,775.98. After deducting manufacturing expenses, net interest on expenses, the net income for the year carried to surplus amounted to $80,365.66. There was charged off from the surplus account $215,610.64. Samuel Insull, chairman of the board, in his annual report explained this as follows:

"For many years the company has carried on its balance sheet, under the caption "deferred charges," an item principally made up of the original cost of developing its branch offices and the brokerage upon the sale of its preferred stock. It has now been deemed wise to begin to make some substantial reductions in this item, and you will note in the surplus account an item of $215,610.64, which means that this amount has been taken from the deferred charges and has been charged against the surplus of the company."

### Monitor Controller Changes in Sales Organization

The Monitor Controller Company, Baltimore, manufacturer of the "just-press-a-button system" of automatic motor control for all kinds of motor-driven machinery, announces that C. J. Mundo has been appointed in charge of its Pittsburgh office in the Union Arcade Building, Pittsburgh.

G. H. Armstrong, who was formerly in charge of the Pittsburgh office, has been moved to Cincinnati with offices at 307 First National Bank Building. Mr. Armstrong's territory will comprise southwstern Ohio, southern Indiana and Kentucky.

**William Ryle & Company,** manufacturers of silk for electrical purposes, announce the removal of their office and salesroom to 381 Fourth Avenue, New York City.

**Charles G. Schwartz,** 217 Centre Street, New York City, manufacturer and dealer in electric motors, etc., has purchased the former seven-story plant of F. G. Smith, Inc., manufacturer of pianos, Fulton Street, Brooklyn, at a bankruptcy sale, for an amount of $47,000, and will use the factory for his business.

**The Royal Electric Supply Company,** 125 North Fourth Street, Philadelphia, has leased the building at 145-7 North Fourth Street for extensions in its business.

**The Master Electric Company,** Dayton, Ohio, announces the appointment of Herbert O. Sauer as sales service manager. Mr. Sauer's former experience has been in the advertising business with the National Cash Register Company.

**The Jeannin Electric Company,** Toledo, Ohio, manufacturer of motors, has appointed D. D. Gill, 712 Ferguson Building, Pittsburgh, as its representative in the western Pennsylvania and West Virginia territory.

**The Howell Electric Motors Company,** Howell, Mich., manufacturer of "Red Band" motors, recently opened a New York City office at 17 East Forty-second Street. R. W. Baker is in charge as district manager. A complete stock is now being carried in its New York City warehouse.

**The Cummings Manufacturing Company,** Indianapolis, manufacturer of battery boxes and kindred equipment, is moving into a new plant at 1118 South Harding Street, to provide for extensive increase in production.

## Western Electric's Record-Breaking Year

Gross sales of the Western Electric Company in 1922 amounted to $210,941,000, a gain of $21,176,000 over 1921 and the largest volume of business in the company's history, according to the annual report of President Charles G. Du Bois. Of this volume, $158,614,000 was sold to the associated companies of the Bell System and $52,327,000 to others. The net earnings for the year amounted to $9,235,890, from which was paid interest and amortization of bond discount of $3,904,097 and dividends of $4,186,857, leaving a balance carried to common stock of $1,144,936. The net earnings amounted to 7.7 per cent on the average investment for the year.

A careful survey of the prospects, according to President Du Bois, indicates that the billings in 1923 will somewhat exceed those for 1922. The unfilled orders at the end of 1922 aggregated $62,000,000, a smaller figure than at the end of either of the two preceding years. This is due to the greater expedition in completion of orders on account of the company's larger manufacturing facilities.

During the year the company paid off $15,000,000 of first mortgage bonds by funds secured from the sale of 150,000 shares of common stock to its common stockholders. It called for redemption its issue of $28,600,000 of 7 per cent convertible bonds. The holders of $24,679,600 worth of these bonds converted into the company's 7 per cent preferred stock, and the balance was paid off at 102. This preferred stock is owned by 8,698 shareholders, the average holding being twenty-eight shares. The company's financial position has been still further improved by reducing the bills payable from $29,050,000 to $12,000,000. Current assets and current liabilities are both somewhat less than at the end of the previous year, leaving the net working capital substantially the same at $70,469,326.

During 1922 the economic and industrial condition in foreign countries with few exceptions showed little or no improvement. Notwithstanding adverse conditions, the sales of the International Western Electric Company, which conducts the export and foreign business of the Western Electric Company, were in 1922 approximately $35,000,000 reckoned at current rates of exchange. This figure includes the sales of the principal foreign affiliated companies.

## New Incorporations

THE MORGANTOWN ELECTRIC COMPANY, Bowling Green, Ky., has been organized by Dr. A. M. Rowe, L. C. Alderson and H. W. Sublett.

THE CUMBERLAND HYDRO-ELECTRIC POWER COMPANY, Frankfort, Ky., has been chartered with a capital stock of $100,000 by Charles H. Morris, Frankfort; Samuel A. Tescher and Harny A. Mansfield, both of Indianapolis, Ind.

THE ELKTON (MD.) ELECTRIC COMPANY, INC., has been incorporated by John H. Ware, Jr., Phillip H. Close and Roy F. Simons. The company is capitalized at $100,000 and proposes to acquire and operate properties of Gilpins Falls Hydro-Electric Trust Estate.

THE RIPLEY (MISS.) ELECTRICAL LIGHTING & POWER CORPORATION has been chartered with a capital stock of $15,000 by Charles T. Nelms, Lee Cox and T. C. Hines.

## Foreign Trade Notes

AUTOMATIC TELEPHONES BEING CONSIDERED FOR JESSELTON, BORNEO.—The installation of automatic telephones in Jesselton, British North Borneo, according to *Commerce Reports*, is under consideration.

RADIO TELEGRAPH STATIONS FOR AMAZON VALLEY, BRAZIL.—Credit for the purpose of acquiring fourteen radio receiving stations, *Commerce Reports* states, has been asked by the Brazilian Minister of Transportation and Public Works. It is proposed to install these stations, which will be equipped with audion receivers and low-frequency amplifiers, in the States of Acre and Amazonas.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in South Africa (No. 5,777) of electric meat choppers and other supplies for butchers, dairy utensils and weighing apparatus.

An agency is desired in Brazil (No. 5,791) for electric welding machinery.

EQUIPMENT FOR POWER PLANTS WANTED IN CHINA.—Electric generating machinery to furnish electricity in ten towns in the Antung, China, consular district, *Commerce Reports* states, is desired by a Chinese firm, which is reported to have contracts to install these plants. The capacities of the proposed plants range from 11 kw. to 110 kw., or sufficient to supply 700 to 5,000 16-cp. lamps. The firm wishes to act as agent for an American manufacturer who desires representation in the district tributary to Antung. Further particulars may be obtained from the Electrical Equipment Division, Bureau of Foreign and Domestic Commerce, Washington, D. C., or district offices by referring to file No. 85,923.

EQUIPMENT FOR THE MANGAHAO POWER SCHEME, NEW ZEALAND.—Tenders will be received by the Public Works Department, Wellington, New Zealand, until May 29 for two petrol engines, generators and accessories and six single-phase transformers in connection with the Mangahao electric power scheme. Tenders will also be received until May 1 for oil filtering and testing sets in connection with the Mangahao project.

ELECTRIC CRANES FOR ANTWERP, BELGIUM.—Tenders will be received by the municipality of Antwerp for fifteen 2½-ton electric cranes for use at the Bassin Canal, Antwerp. Each crane to be provided with four motors, operating on direct current at 550 volts.

HIGH POWER WIRELESS STATION FOR AUSTRALIA.—Tenders will be received by the Amalgamated Wireless (Australia), Ltd., 97 Clarence Street, Sydney, Australia, until April 30 for furnishing and erecting a high-power duplex station within 100 miles of Sydney or Melbourne, capable of direct communication with England. Suitable corresponding stations to be provided in England and Canada.

POWER STATION FOR CHANGCHOW, CHINA.—A power station is being erected at Changchow, China, at a cost of $500,000, by the Chen Hwa Electric Company.

BRONZE AND COPPER WIRE FOR AUSTRALIA.—Tenders will be received by the Postmaster-General's Department, Australia, until April 10 for 700 tons of bronze wire and 1,900 tons of copper wire for the Post and Telegraph Department. Specifications and tender forms may be obtained of D. B. Edwards, official secretary, in charge of the office of the Australian Commissioner, 44 Whitehall Street, New York City.

## New Apparatus and Publications

WATER SOFTENER.—Bulletin No. 509 distributed by the Graver Corporation, East Chicago, Ind., describes the Graver "Zeolite" water-softening equipment.

THERAPEUTIC LAMP.—A new therapeutic lamp, known as "Q-Ray," has recently been placed on the market by S. Robert Schwartz & Brother, 546 Broadway, New York City.

ENTRANCE SWITCH.—The Palmer Electric & Manufacturing Company, 175 Fifth Street, Cambridge, Mass., has recently placed on the market a new type of entrance switch, known as the "Universal" meter-service switch.

CENTRIFUGAL PUMPS.—Bulletin No. 1,632-F issued by the Allis-Chalmers Manufacturing Company, Milwaukee, describes and illustrates its centrifugal pumps and centrifugal pumping units for power plants, waterworks and industrial plants.

AUTOMATIC TIME SWITCH.—An automatic time switch for henneries, known as the "Cackle" time switch, is being distributed by A. Hall Berry, 73 Murray Street, New York City.

ELECTRIC CLEANER.—The Hoover Suction Sweeper Company, North Canton, Ohio, has developed a new electric cleaner, household size, known as model No. 541.

ELECTRIC ELEVATING TRUCK.—The Cowan Truck Company, 80 Water Street, Holyoke, Mass., is distributing a leaflet, covering its new model "LLT" electric elevating truck.

ELECTRIC DISHWASHER.—An electric household dishwasher, "Hydrola," is being manufactured by the Hydrola Dishwasher Company, Hillsdale, Mich.

ELECTRIC TRAFFIC SIGNALS.—A bulletin describing three electrical directing traffic markers is being distributed by the Traffic Control, Inc., Milwaukee.

STEAM TURBINES.—"De Laval Equipment in a Textile Mill" is the title of a bulletin issued by the De Laval Steam Turbine Company, Trenton, N. J., which describes the use of low-pressure steam in a manufacturing plant for process purposes supplied from a turbine of special design.

LUMBER REGISTER.—The Industrial Service Company, Alisky Building, Portland, Ore., has issued a complete directory of the lumber industry and allied industries of the Northwest. It contains more than 6,400 names and indicates the type of mill and machinery it is equipped with, and also whether the power used is steam or electricity.

FACTORY BUILDINGS.—The Austin Company, Cleveland, has published a booklet entitled "Multi-Story or Single-Story—Which?" in which a comparison of the relative advantages and disadvantages of multi-story and single-story factory buildings is made.

RANGE BOILER COVER.—A new range boiler cover for use in connection with the "A & F" and other electric water heaters has been developed by the Arthur & Fowler Company, Spokane, Wash. The Washington Electric Supply Company, South 132 Monroe Street, Spokane, Wash., is distributor.

MOTOR DRIVE FOR AMMONIA COMPRESSORS.—"Synchronous Motor Drive for Ammonia Compressors" is the title of bulletin No. 41,316 issued by the General Electric Company, Schenectady, N. Y., which gives a brief treatment of the development of ice-making machines with suggestions as to the trend of progress.

INSULATION.—The Mica Insulator Company, 68 Church Street, New York City, has developed an insulation, known as "Armatite," which is made for all insulating and protective purposes.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

MILO, ME.—The Milo Electric Light & Power Company has petitioned the Public Utilities Commission for permission to purchase the property and holdings of the Sebac (Me.) Dam Company.

BOSTON, MASS.—The Edison Electric Illuminating Company plans to build an addition to its substation No. 12, on Chatham Street.

CAMBRIDGE, MASS.—Additions will be made to the power plant of the Atheneum Press, Ginn & Company, within the next year, which will include the installation of a 500-kw., 125-volt direct-current generating set. G. H. Kimball is superintendent of power department.

WORCESTER, MASS.—The New England Power Company has applied to the Department of Public Utilities for authority to issue $3,000,000 in capital stock, the proceeds to be used for the erection of transmission lines from Adams to Pittsfield, for construction work at Davis Bridge, N. H., and for other extensions and improvements.

PROVIDENCE, R. I.—The Narragansett Electric Lighting Company contemplates the construction of a new switch house, to cost about $1,000,000.

SOUTH NORWALK, CONN.—Extensions to the municipal electric plant, to cost about $300,000, are under consideration.

## Middle Atlantic States

BUFFALO, N. Y.—The Superior Elevator Company will install electric power equipment in connection with extensions to its grain elevator on the Buffalo River, to cost about $275,000.

CHATHAM, N. Y.—The Chatham Electric Light, Heat & Power Company has applied to the Public Service Commission for a franchise to extend its transmission line to Nassau through the villages of Brainard and East Nassau.

FILLMORE, N. Y.—Extensions and improvements contemplated by the Genesee Valley Power Company this spring include the erection of a 13,200-volt transmission line from East Koy to Portageville, the installation of a second 750-kva., 13,200-volt transformer bank, a second high-voltage lightning arrester and making several changes in the switching equipment at the outdoor substation at the Wiscoy hydro-electric plant. H. G. Young is superintendent.

HOOSICK FALLS, N. Y.—Plans are under consideration by the Board of Trustees for the installation of an ornamental lighting system.

NEW YORK, N. Y.—The United Electric Light & Power Company plans to build an electric generating plant on Locust Avenue, near 139th Street, Bronx, to cost about $800,000. Thomas E. Murray, 55 Duane Street, is engineer.

NEW YORK, N. Y.—The New York Edison Company will build a substation on Canal Place near 140th Street, to cost about $250,000. William Whitehall, 709 Sixth Avenue, is architect.

UTICA, N. Y.—Electric power equipment will be installed in the proposed new ice-manufacturing and ice-cream plant of the Dairyman's League Co-operative Association, 222 Lafayette Street, to cost about $100,000.

WATERVLIET, N. Y.—The London Steam Turbine Company, 50 Church Street, New York, plans to build a power house at its proposed plant for the manufacture of engines, to cost about $150,000.

MORRISTOWN, N. J.—The Central Jersey Power & Light Company, recently organized with a capital of $2,000,000, has acquired the Commonwealth Electric Company and the Morris & Somerset Electric Company and will merge the properties. Extensions and improvements are contemplated.

HANOVER, PA.—The Metropolitan Edison Company has issued $1,000,000 in bonds, the proceeds to be used to acquire the

Hanover Power Company and its subsidiary organizations, and for proposed extensions and improvements.

MARTIN'S CREEK, PA. — The Alpha Portland Cement Company and not the Atlas Portland Cement Company, as stated in these columns last week, will make extensions and improvements in the power plant at its local mills.

McKEE'S ROCKS, PA.—The W. L. Singer Ice Company plans to rebuild its power house, recently damaged by fire, including ice department, causing a loss of about $75,000.

PHILADELPHIA, PA. — Electric power equipment will be installed in the proposed addition to the plant of Stephen F. Whitman & Son, Inc., 415 Race Street, to cost about $500,000.

PHILADELPHIA, PA.—The Philadelphia & Reading Railroad Company will build a power plant in connection with its proposed car dumper at Port Richmond, to cost about $1,500,000.

READING, PA.—The plant of the Reading Ice & Cold Storage Company will be equipped for electrical operation throughout, at a cost of about $90,000.

CUMBERLAND, MD. — The West Penn Power Company contemplates extensions and improvements to the system of the Edison Electric Illuminating Company, recently acquired.

HAGERSTOWN, MD. — The Maryland Glass Sand Company is planning to install a power plant at its works near Hancock and to equip all departments for electrical operation.

FRANKLIN, W. VA.—Plans are being prepared for the construction of a municipal electric plant on the South Branch of the Potomac River.

HUNTINGTON, W. VA.—Bids will be received by the United State Engineer Office until March 27 for two switchboards (Circular 104).

NORTH EMPORIA, VA. — The Little-Dewey Veneer Company contemplates the construction of a power house at its proposed local mill.

STUART, VA.—W. H. Clark, owner of the local electric plant, is in the market for an 80-kw. electric generator set, with auxiliary machinery.

SUFFOLK, VA.—The ice and cold-storage plant of N. R. Withers is being remodeled. The entire plant will be equipped with electrically driven machinery. Henry B. Reardon, Jr., Norfolk, is consulting engineer.

WASHINGTON, D. C.—Bids will be received by the Commissioners of the District of Columbia, District Building, until March 28 for furnishing and installing an electric time and bell system in the Shaw Junior High School.

WASHINGTON, D. C.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until April 5 for furnishing watt-hour meters, motors, steel conduit, Pierce pins, receptacles, sockets, white hard-horn fiber, varnished silk, spark plugs, vacuum tubes, etc.

## North Central States

DETROIT, MICH. — The Ford Motor Company will build a generator plant at its factory, to cost about $45,000, exclusive of machinery.

JACKSON, MICH.—The Michigan Seating Company will build a power house, 75 ft. by 130 ft. at its plant.

MARYSVILLE, OHIO.—Bids will be received by the Department of Public Welfare, Ninth and Oak Streets, Columbus, until April 4 for construction of cottage, to cost $150,000; superintendent cottage, $35,000, and power plant and chimney, $20,000, at the Reformatory for Women at Marysville.

WARREN, OHIO. — The Ohio Public Service Company has issued $2,675,000 in bonds, part of the proceeds to be used for extensions.

CHINNVILLE, KY.—The Kentucky Refractories Company, Ironton, contemplates the construction of a power house in connection with its proposed local refractory plant, to cost about $80,000.

LOUISVILLE, KY.—The Louisville Gas & Electric Company contemplates extensions and improvements to its hydro-electric plant at Ohio Falls.

OWENSBORO, KY.—Bolger & Medley plan to install a power house in connection with a new brick and tile products plant, to cost about $65,000.

INDIANAPOLIS, IND.—The Indianapolis Light & Heat Company is planning extensions and improvements during the present year involving an expenditure of about $1,250,000. The proposed work will include the installation of a 27,000-hp. turbine with boilers, condensers and the erection of a large smokestack at the Kentucky Avenue power station; installation of a storage battery and direct-current motor-generator sets in substation in the rear of central offices; installation of new cables in conduits in the downtown business district; installation of copper cables, both aërial and underground; construction of an 8,000-hp. substation at Speedway City, and a substation at Keystone Avenue and the L. E. & W. railroad to furnish electricity for lamps and motors for Broad Ripple district.

JASPER, IND.—Work will begin at once on improvements to the municipal power plant, to cost about $60,000. J. R. Lowe, 111 Third Street, Louisville, Ky., is consulting engineer.

KOKOMO, IND. — The Public Service Commission has authorized the Northern Indiana Power Company to issue $218,000 in capital stock and $470,000 in bonds, the proceeds to be used for improvements, including the erection of a transmission line from Kokomo to Converse, from Kokomo to Noblesville and from there to Sheridan. Improvements will be made to the substations at Kirklin, Noblesville, Kokomo and other places.

MARSEILLES, ILL. — Electric power equipment will be installed in the proposed baking plant to be erected by the National Biscuit Company, to cost about $500,000. A. G. Zimmerman, 85 Ninth Avenue, New York, is architect.

GREEN BAY, WIS.—The installation of ornamental lamps in Bay View Beach Park, Whitney Park and possibly other parks is under consideration.

WABENO, WIS.—The Wabeno Lighting Company contemplates improvements to its plant, including the installation of a new engine.

WAUSAU, WIS.—The Wisconsin Valley Electric Company contemplates installing a new generator and turbine at its Jersey City power plant.

WHITEWATER, WIS.—Plans are under way by the Wisconsin Gas & Electric Company, Racine, for the erection of a 132,000-volt transmission line from the new generating plant of the Milwaukee Electric Railway & Light Company on the lake shore to Whitewater. A site on South Franklin Street has been acquired for the substation.

WILLMAR, MINN.—Plans are being prepared for a municipal electric power plant, to cost about $100,000. Cory & Lecoco, Aberdeen, S. D., are engineers.

CEDAR RAPIDS, IOWA. — The Iowa Railway & Light Company is planning to erect a 33,000-volt transmission line between Boone and Nevada, 24 miles. The proposed line will also connect up the generating stations at Cedar Rapids, Boone and Perry.

FORT MADISON, IOWA.—Improvements are contemplated by the Fort Madison Electric Company, involving an expenditure of about $50,000.

KANSAS CITY, MO.—The Council is considering the construction of a new fire house, the purchase of fire-alarm equipment, underground cables and equipment, etc., to cost about $216,000.

LAKE NORDEN, S. D.—Steps have been taken by business men of Lake Norden and Hayti to secure an improved lighting system for both towns. The question of having transmission lines extended to the towns is under consideration.

ELMDALE, KAN. — A special election will be held on April 2 to vote on the proposal to issue $12,000 in bonds for the erection of a transmission line from Cottonwood Falls to Elmdale.

FREDONIA, KAN.—At an election held recently the proposal to issue $150,000 in bonds for the installation of a municipal electric light plant was carried.

TOPEKA, KAN.—The Ismert & Hincke Milling Company, Washington and Tenth Streets, plans to build a power house in connection with other plant extensions.

WICHITA, KAN.—Bids, it is reported, will soon be asked by the city manager for the installation of a new fire-alarm system, to cost about $60,000.

## Southern States

GREENSBORO, N. C.—Plans are being prepared for the installation of ornamental lamps on portions of Market and Washington Streets. The street-lighting service is furnished by the North Carolina Public Service Company.

CHARLESTON, S. C.—The F. P. Burton Lumber Company plans to rebuild its power house and mill, recently destroyed by fire with loss of about $400,000.

AUSTELL, GA.—Plans for the proposed chair-manufacturing plant to be erected by Charles J. Shelverton and associates include a power plant.

ROME, GA.—Electric power equipment will be installed in the proposed addition to be erected at the Berryton Cotton Mills, to cost about $160,000.

GAINESVILLE, FLA.—A bond issue of $300,000 is being arranged for extensions to the municipal power plant and waterworks and sewerage system.

MIAMI, FLA.—The Coral Gables Utilities Company, recently organized with a capital stock of $500,000, has tentative plans for the construction of a power plant and system. George E. Merrick is president.

SEBRING, FLA.—Plans are under consideration for extensions and improvements in the municipal light and water plant, recently acquired from the Sebring Light & Water Company.

CHATTANOOGA, TENN.—The Tennessee Electric Power Company is preparing plans for a 20,000-hp. hydro-electric plant at Grand Falls. It is also proposed to build a 27,000-hp. steam-operated electric plant at Hales Bar. The cost of the plant is estimated at about $3,000,000.

KNOXVILLE, TENN.—The Knox Porcelain Company, recently organized will install a power plant in connection with its proposed local works for the manufacture of electrical porcelain specialties. J. N. House is president.

ROCKWOOD, TENN.—The Roane Iron Company, Chattanooga, plans to build a power plant at its local ironworks. The equipment will include a 1,500 kw. turbo-generator.

EUTAW, ALA.—A bond issue of $45,000 has been sold, the proceeds to be used to establish a municipal lighting plant and waterworks.

TUSKEGEE, ALA.—The West Memphis Lumber Company, Memphis, Tenn., plans to build a power plant at its proposed local lumber mill, to cost about $100,000.

HERMITAGE, ARK.—M. C. Sanders is organizing a company to construct and operate a power plant for local service.

ALEXANDRIA, LA.—The Missouri Pacific Railroad Company and the Texas Pacific Railroad Company, St. Louis, Mo., plan to build a power house in connection with new joint shops, to cost about $1,000,000.

NEW ORLEANS, LA.—The Todd Shipyards Corporation, 25 Broadway, New York, will build a power house in connection with its proposed drydock and shipbuilding plant, to cost about $3,000,000.

HELENA, OKLA. — Extensions to the municipal electric distribution system are under consideration. J. D. Bomford, Masonic Temple Building, Enid, is engineer.

PAULS VALLEY, OKLA.—Plans have been completed and bids, it is understood, will be called at once for the construction of a transmission line for municipal service. V. V. Long & Company, 1300 Colcord Building, Oklahoma City, are engineers.

BYERS, TEX.—Steps have been taken by the Chamber of Commerce for a municipal lighting plant and ice-manufacturing plant.

CHILDRESS, TEX.—The Texas Central Power Company has authorized plans for the construction of electric power plants, with ice-manufacturing plants adjoining, at Childress, Vernon and Beeville. The total cost is estimated at $225,000.

DALLAS, TEX.—The Dallas Mill Company, recently organized with a capital stock of $1,000,000, plans to build a power plant in connection with its cotton mill, to be erected on the Love Aviation Field.

DALLAS, TEX.—Plans are under consideration by the St. Louis & Southwestern Railroad Company, known as the Cotton Belt Railroad, Cotton Belt Building, and the Texas Electric Railroad Company for equipping the railroad from Plano to Greenville for electrical operation. The cost is estimated at about $600,000. J. G. Hailey is electrical engineer of the Texas Electric Railroad.

DEL RIO, TEX. — The Texas Central Power Company is planning to reconstruct its local distribution system this summer.

EL PASO, TEX.—Plans are under way for the installation of an ornamental lighting system in the business district.

ENNIS, TEX.—Plans have been approved for a municipal electric plant, to cost $50,000, for which, it is understood, bids will soon be asked.

FORT WORTH, TEX.—The Trinity & Brazos Valley Railroad Company contemplates the construction of a large substation

in connection with the electrification of its line from Hillsboro to Cleburne, to cost about $150,000.

HARLINGEN, TEX. — Negotiations are under way between E. B. Neiswanger and associates for the purchase of the municipal electric plant. If the deal goes through a new central station will be built. The proposal to sell the plant will be submitted to the voters on April 10.

KOSSE, TEX.—The Kosse Light & Power Company contemplates extensions and improvements to its system. Its capital stock has been increased from $12,000 to $25,000.

SMITH'S BLUFF, TEX.—The Humphreys-Pure Oil Company, Pure Oil Building, Columbus, Ohio, plans to build a power plant in connection with a local oil refinery, to cost about $2,500,000.

TERRELL, TEX.—The Texas Power & Light Company, Dallas, is extending its high-tension transmission line from Terrell to Wills Point, a distance of 12 miles.

WACO, TEX.—The Waco Lime & Products Company, recently organized, contemplates the construction of a new local plant, including power house, to cost about $125,000. B. F. Litsinger is president.

WILLS POINT, TEX.—An election will be held on April 3 to vote on the proposal to issue $25,000 in bonds to establish a municipal electric light light and power plant.

## Pacific and Mountain States

PROSSER, WASH.—The installation of a municipal electric plant is under consideration.

SEATTLE, WASH.—Bids will be received by the city of Seattle until April 13 for the erection of 100 miles of 165,000-volt transmission line and telephone line from the Gorge Creek plant of the Skagit River development. The line will transmit power from the Gorge Creek plant to a substation outside of the city. Specifications will be complete March 30. Further information may be obtained at the office of the Skagit River Development, Alaska Building. C. F. Uhden is chief engineer.

VANCOUVER, WASH. — The Clarke County Water, Light & Power Company, recently organized, is having plans prepared for a transmission system for service at Sifton, Battle Ground, Brush Prairie, Orchards and vicinity, to cost about $50,000.

VANCOUVER, WASH.—A new substation (to cost about $50,000) is being erected here by the Northwestern Electric Company, Portland, Ore. The company also plans to erect a 66,000-volt transmission line from Camas to Vancouver, to cost about $75,000.

VERNONIA, ORE.—The Vernonia Light & Power Company has begun preliminary work on the erection of its electric distribution system within the city limits. Work will soon begin on the construction of the dam in Rock Creek, about 9 miles from here.

HUNTINGTON BEACH, CAL. — Plans are under consideration for the installation of a lighting system on the state highway, to cost about $20,000.

LOS ANGELES, CAL.—Bids will be received by the Public Service Commission until March 27 for potential transformers and current transformers (Spec. P-306-350)

MODESTO, CAL.—The Modesto Irrigation District plans to erect electric substations, transmission and distributing lines to cost about $300,000. Percy Jones is chief engineer.

SAN FRANCISCO, CAL.—Arrangements are being made for the installation of a third generating unit of 22,000 kw. capacity in the Caribou plant on the North Fork of the Feather River of the Great Western Power Company of California. Bids will soon be called for hydraulic and electrical equipment. The cost is estimated at about $1,500,000.

SAN FRANCISCO, CAL.—Work will soon begin on the second of the chain of power houses on the Pit River to be erected by the Pacific Gas & Electric Company, which will ultimately develop more than 600,000 hp. The plant which will be known as Pit River plant No. 3, will be equipped with three 27,000 kva. units and will cost about $17,000,000. The plant will operate under a static head of 313 ft. The plant will be located about 12 miles below Pit River No. 1 and will involve construction of a diversion dam 125 ft. high and a tunnel 22,000 ft. in length, having a carrying capacity of 3,000 cu.ft. per second.

PHOENIX, ARIZ.—An additional 7,500-kw. generating unit will be installed at the hydro-electric plant at the Roosevelt Dam on Salt River by the Salt River Valley Water Users' Association. Nineteen control gates will be added in the spillways of the dam, and another dam and power house will be built further down the river to control the release of water for irrigation to permit of higher load factor on the present plant at the dam. The Water Users' Association will issue $1,800,000 in bonds for financing the project.

BUTTE, MONT.—Arrangements are being made by the Montana Power Company to begin work on the construction of its Mystic Lake hydro-electric plant. The purposed plant will be located in the gorge of the Rosebud River, in the Beartooth Mountains, 43 miles from Columbus, and will have a capacity of 15,000 hp.

COLORADO SPRINGS, COL.—The City Council has passed an ordinance providing for the installation of an ornamental street-lighting system on East Platte Avenue, to cost about $17,528.

GOLDEN, COL.—The City Council has granted the Golden Cycle Mining Company permission to erect an electric transmission line from the Pikeview mine to the mill on the West Side.

## Canada

ST. JOHN, N. B.—The installation of a new lighting system, to cost about $79,000, has been recommended to the City Council by B. Wilson, electrical engineer.

STOUFFVILLE, ONT.—The ratepayers have approved a bylaw appropriating $11,000 to secure Hydro power from Bond Lake.

THOROLD, ONT.—The purchase of a switchboard and lead-covered cable is contemplated by the Public Utilities Commission.

TIMMINS, ONT.—The Northern Canada Power Company is planning to build a fourth hydro-electric plant on the Mattagami River at Kenogamissee Falls, to develop 5,000 hp. under a 70-ft. head. The cost including transmission line is estimated at $750,000.

WOODSTOCK, ONT.—Extensions to the municipal electric light and power system, to cost about $25,000, are under consideration by the Public Utilities Commission.

## Electrical Patents

**Announced by U. S. Patent Office**

(Issued Feb. 27, 1923)

1,447,107. ELECTRIC HEATER; E. A. Umble, Denver, Col. App. filed May 2, 1921. Heating metallic objects by immersion liquid.

1,447,134. PROTECTIVE DEVICE FOR ELECTRIC FLATIRONS; W. T. Hoofnagle, Glen Ridge, N. J. App. filed Feb. 10, 1921. Fusible plug opens circuit of predetermined temperature.

1,447,140. PROCESS OF EXTRACTING PRECIOUS METALS; C. C. McBride, Sanger, Cal. App. filed April 23, 1921. By electrolytic process.

1,447,143. MANUFACTURE OF LEAD ALLOYS; W. Matheslus, Charlottenburg, Germany. App. filed Oct. 21, 1922. Alkaline earth metals produced by electrolyzing their fused salts.

1,447,163. COMMUTATING MEANS FOR DYNAMO-ELECTRIC MACHINES; F. T. Hague and O. Needham, Pittsburgh, Pa. App. filed March 9, 1918. Neutralizing transformer electromotive forces produced by exciting field.

1,447,164. MULTIPLE WINDING FOR ALTERNATING-CURRENT MACHINES; F. T. Hague, Pittsburgh, Pa. App. filed Jan. 16, 1919. For low-voltage, high-current alternating-current generators.

1,447,165. RADIO METHOD AND APPARATUS; F. A. Kolster, Washington, D. C. App. filed Jan. 30, 1919. Directional sending and receiving apparatus.

(Issued March 6, 1923)

1,447,171. SWITCH; R. B. Benjamin and E. A. Detrick, Chicago, Ill. App. filed June 21, 1915. Full switches for lamp sockets.

1,447,172. ELECTRICAL SWITCH; R. B. Benjamin, Chicago, Ill., and T. H. Harris, Dayton, Ohio. App. filed Sept. 11, 1917. Pull switch for electric light fixtures.

1,447,181. HEATING PAN; W. Richmond, Chicago, Ill. App. filed March 26, 1920. Thermostatically controlled pad for treating mastoid or sinus conditions.

1,447,194. THERMAL CONTROLLER FOR ELECTRIC MOTORS AND THE LIKE; J. R. White, Washington, D. C. App. filed July 3, 1919. Rheostat contact arm consists of a spring held in place by magnet when circuit is closed.

1,447,204. PLURAL MODULATION AND DEMODULATION CITCUITS; L. Espenschied, Queens, N. Y. App. filed Sept. 30, 1919. Multiplex transmission of radio signals.

1,447,214. RADIATOR HEATER; J. A. Kurrus, East St. Louis, Ill. App. filed June 14, 1921. Small electric heater for automobile radiators to prevent freezing of water.

1,447,236. MAGNETIC REPULSION OR ATTRACTION RELAY; C. H. Chaney, Detroit, Mich. App. filed Dec. 15, 1920. Automatic regulator for electric furnaces.

1,447,238. LIGHTING FIXTURE; D. Crownfield, Cambridge, Mass. App. filed Dec. 3, 1919. Double reflectors used for diffused lighting.

1,447,241. ELECTRICAL SYSTEM FOR AUTOMOBILES; G. Fornaca, Turin, Italy. App. filed Jan. 12, 1920. Motor-generator for automobiles.

1,447,282. GENERATOR; L. A. Darling, Philadelphia, Pa. App. filed April 30, 1919. Turbo-generator unit for steam locomotives.

1,447,318. BATTERY-CHARGING SYSTEM; A. H. Neuland, Jersey City, N. J. App. filed Dec. 17, 1917. Automobile battery-charging system.

1,447,357. FLEXIBLE ELECTRODE; D. B. Price, Newtonville, Mass. App. filed Feb. 13, 1920. Non-corrosive terminals for storage batteries.

1,447,359. VENTILATED LINE INSULATOR; L. Steinberger, Brooklyn, N. Y. App. filed Nov. 26, 1918. A point midway between supporting pin and line.

1,447,399. DEVICE AND METHOD FOR MAKING STEREOSCOPIC X-RAY PICTURES; L. W. Pease, Chicago, Ill. App. filed June 6, 1919. Arrangement of special film plate.

1,447,405. LENS RING; E. R. Barany, Brooklyn, N. Y. App. filed July 26, 1922. For flashlight cases.

1,447,430. SCREEN FOR X-RAY PHOTOGRAPHY; G. W. Richardson, Chicago, Ill. App. filed Feb. 27, 1919.

1,447,464. STARTING DEVICE FOR INTERNAL-COMBUSTION ENGINES; E. Friedrichs, Stuttgart, Germany. App. filed Aug. 11, 1921.

1,447,477. ELECTRICAL STARTER FOR EXPLOSIVE ENGINES; G. K. Knapp, Nuremberg, Germany. App. filed Oct. 11, 1920.

1,447,480. ELECTRIC SYSTEM; S. J. Matthews, Fort Clinton, Ohio. App. filed March 7, 1917. Small plant for lighting, heating, power, etc.

1,447,481. THERMIONIC VALVE; H. Morris-Airey and G. Shearing, Portsmouth, and S. R. Mullard, Southfield, London, England. App. filed Aug. 22, 1921. Conductor and seal for thermionic valve.

1,447,509. TELEPHONE METERING SYSTEM; A. M. Crichton, Uniontown, Pa. App. filed April 13, 1920. Meter on subscriber's instrument must be partially actuated before getting central.

1,447,517. AUTOMATIC TEMPERATURE-CONTROL MEANS FOR ELECTRIC FURNACES; T. A. Reid, East Orange, N. J. App. filed Aug. 6, 1920. Thermocouple inserted in the furnace maintains through suitable apparatus predetermined temperature.

1,447,531. REVOLVING TELEPHONE STAND; E. F. Carlson, Brooklyn, N. Y. App. filed Nov. 3, 1921. Compact arrangement of a number of telephones on one stand.

1,447,532. GAS IGNITER; H. S. Cederholm, Wellington, New Zealand. App. filed March 3, 1921. Fine platinum wire heated by small battery.

1,447,570. SYSTEM OF CONTROL OF ELECTRICAL CIRCUITS; W. H. Powell, Milwaukee, Wis. App. filed April 22, 1918. Control of armature reaction for booster rotary converters.

1,447,574. ELECTRIC TOASTER; E. A. Rutenber, Milwaukee, Wis. App. filed March 28, 1922. Automatically turns bread when side is lowered.

1,447,593. FURNACE; W. R. Macklind, Chicago, Ill. App. filed Jan. 24, 1920. Continuous rotary furnaces, for treating lithopone.

1,447,646. SELENIUM CELL OR BRIDGE; C. W. Cherry, Boston, Mass. App. filed April 13, 1922. Large active surface area provided.

1,447,657. ELECTRODE FOR ALKALINE STORAGE BATTERIES; P. G. and E. Roesel, Paris, France. App. filed Sept. 14, 1920.

1,447,730. ELECTRIC WRITING INSTRUMENT; C. R. Post, New Rochelle, N. Y. App. filed Nov. 24, 1920. Electrical heated stylus for check or document writing.

1,447,747 AND 1,447,748. METHOD OF AND APPARATUS FOR OPERATING SYNCHRONOUS TELEGRAPH SYSTEM; G. R. Benjamin, Jersey City, N. J. App. filed Aug. 8, 1919. Automatic cable transmitters for synchronous printing telegraph systems.

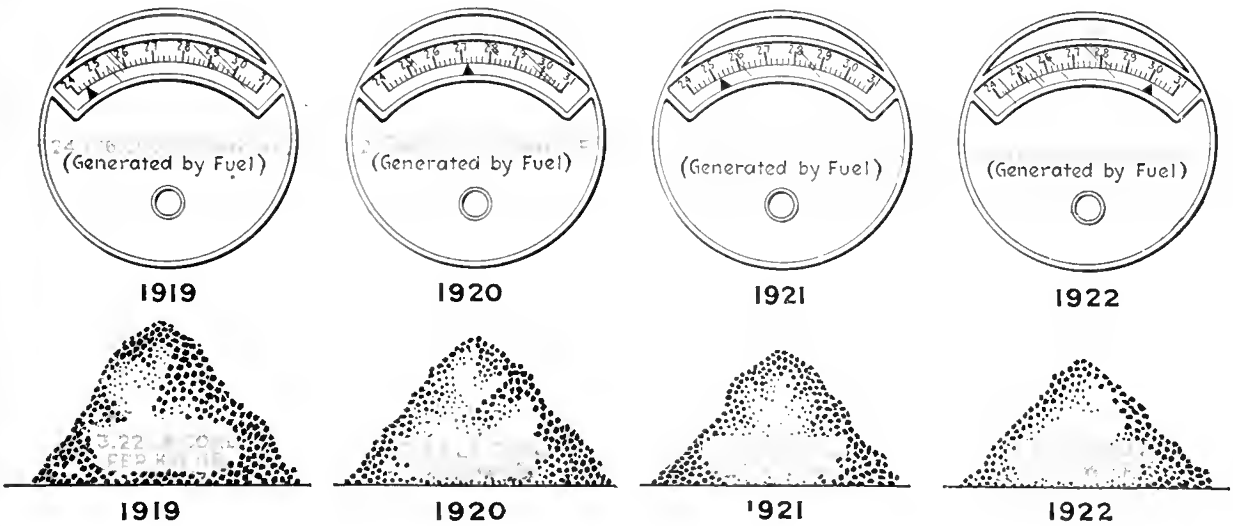
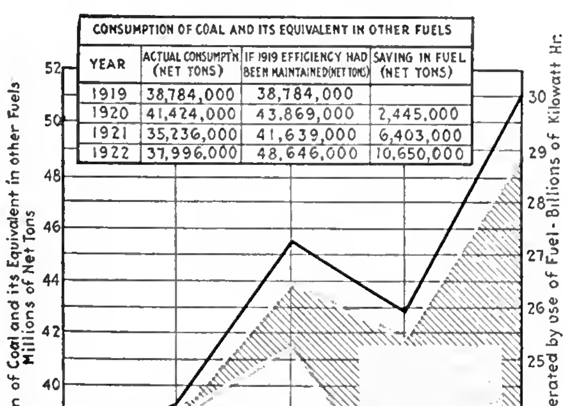
## 19,498,000 Net Tons of Coal Saved in Three Years by Central Stations Through Increased Efficiency in Fuel Consumption



## Increased Efficiency In Fuel Consumption Saved Central Stations $92,128,000 In Three Years



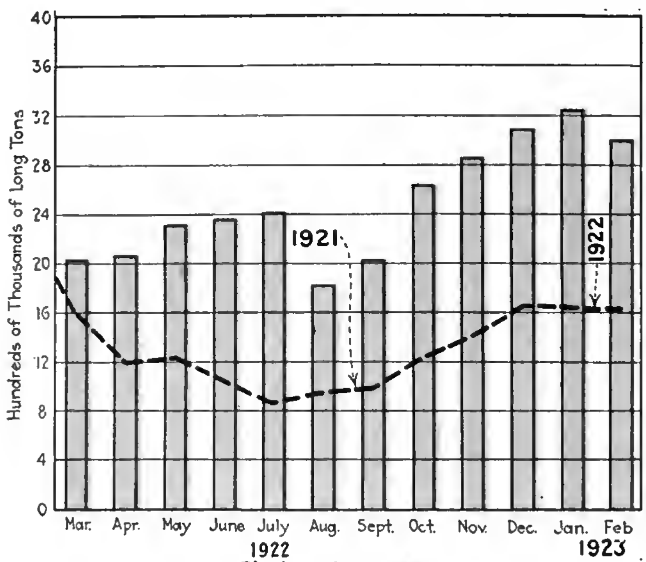
CONSUMPTION OF COAL AND ITS EQUIVALENT IN OTHER FUELS

| YEAR | ACTUAL CONSUMPT'N (NET TONS) | IF 1919 EFFICIENCY HAD BEEN MAINTAINED (NET TONS) | SAVING IN FUEL (NET TONS) |
|---|---|---|---|
| 1919 | 38,784,000 | 38,784,000 | |
| 1920 | 41,424,000 | 43,869,000 | 2,445,000 |
| 1921 | 35,236,000 | 41,639,000 | 6,403,000 |
| 1922 | 37,996,000 | 48,646,000 | 10,650,000 |

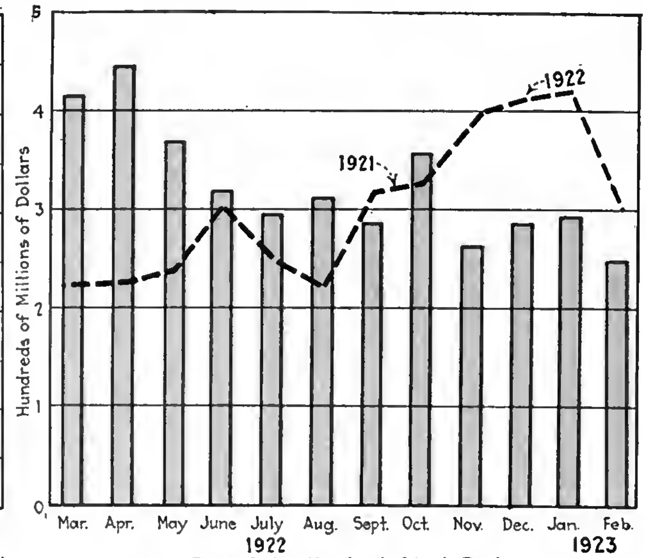
## An Accomplishment in Increased Efficiency

EFFICIENCY of operation is one of the prime essentials of modern industry, and the elimination of waste has become the great problem of the engineer. The results of the studies which the United States Geological Survey has made of the consumption of coal per kilowatt-hour of electrical energy manufactured point to large gains in the efficient operation of the boiler room. A saving of almost three-quarters of a pound of coal per kilowatt-hour means not only cheaper production of power, but also a saving of many millions of tons of coal annually. Not only is the industry itself deriving large results from the more efficient consumption of coal, but the industry is rendering large service to the public in thus conserving fuel. More than nineteen million tons of coal were saved in three years by the central station, a quantity of fuel which represents almost two-thirds of the annual consumption of coal by the public utility generating plants of the country, including electric railway plants. The figures indicate that an even higher efficiency in fuel consumption may be expected in the future.

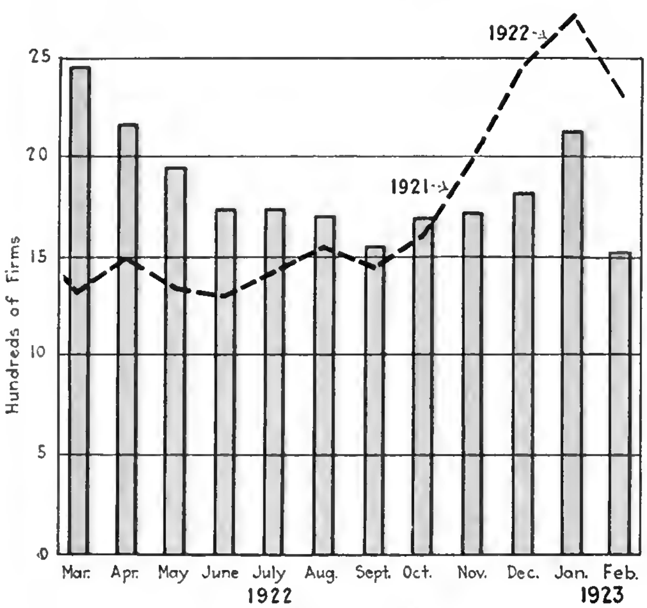
## How the Primary Industries Are Trending



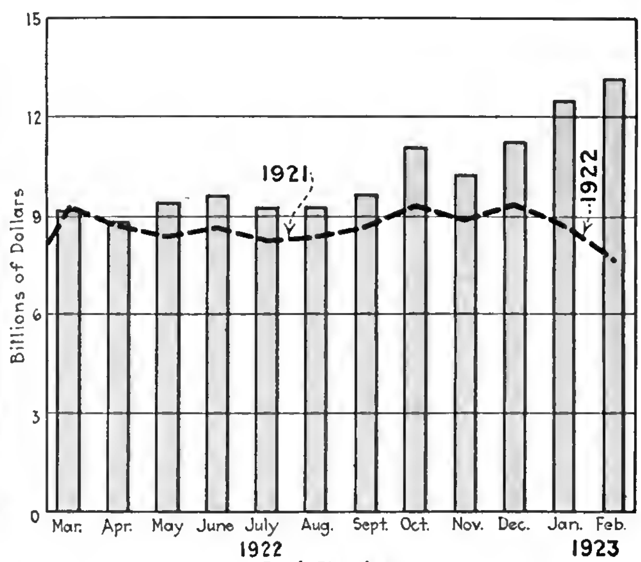
Pig-iron Production



Total Bond Sales, New York Stock Exchange

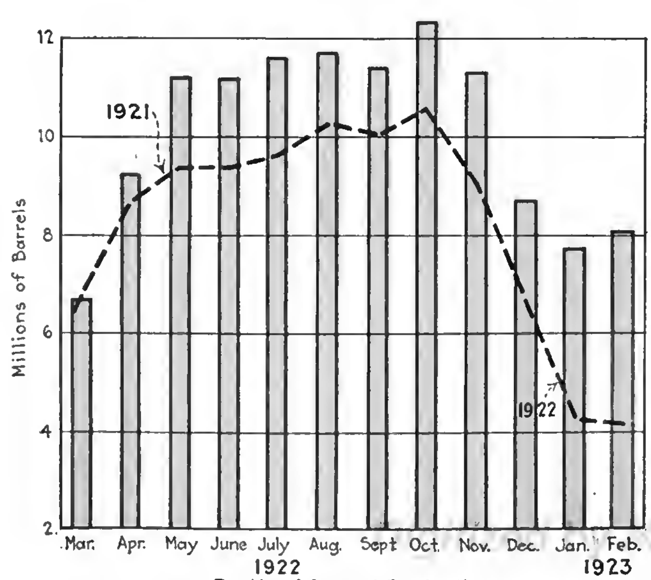


Business Failures



Bank Clearings

(Outside of New York City)



Portland Cement Production

## An Indicator of Record Construction

February being from two to three days shorter than the other months of the year, it is inexpedient to compare the total output of any commodity during February with the output of that commodity during any other month. But the fact that the output of Portland cement during February was almost double that reported for February last year is significant. Cement production in February of last year was almost three and a half million barrels under the January output, while this year the February output is about two hundred thousand barrels over that reported for January. Only a large construction program for the spring throughout the country could call for such large quantities of cement. The record construction witnessed during the past year is evidently in a fair way toward being eclipsed. And a large building program means large purchases of electrical appliances and supplies, and ultimately increased electrical energy requirements.

## The Practical Aspects of Power Transmission

AS THE cost of coal rises, decade by decade, the value of water power in any country tends steadily to rise. Naturally the cost of hydro-electric plant construction and development likewise tends to increase with time, but the value of the potential energy in high-level water is always augmenting. This is but another way of saying that as the industrial application of petrified solar heat, millions of years old, rises in price the value of solar-heat energy, a few months old, in lifting the top layers of the oceans to mountain levels steadily appreciates. On the other hand, the waterfalls that are most readily accessible, least entangled with artificial restrictions, and nearest to a power market, are the ones that naturally first become developed; while the more expensive, remote and handicapped waterfalls have to wait longer before men will venture their savings upon developing them. Eventually, we may expect to see a great hydro-electric development of power in all parts of the world, but the limit to which it can be carried depends upon the cost at which power can be produced by other and competitive means.

There is no limiting distance recognized in engineering as fixing the range of electric power transportation over one and the same continent. If it were necessary to carry power electrically from the Atlantic to the Pacific Coast, it is probable that engineers would undertake the project. They could not, however, do so in competition with locally produced power at the motor end of the line. The entire question of electric power transmission is a technical one circumscribed by economics.

The project of a long power-transmission line involves a consideration of electrical principles, with experience in their application and of economics in execution. There is no possible way of reducing the entire project to a formula. Rather is the solution of the problem to be regarded as a judicious compromise among many formulas. Among the matters to be decided are the routing of the line, the number and spacing of the towers with a view to their safe loading, the number of conductors, their spacing and arrangement, the nature of the conductors and their suspension for safety from ice and wind, the nature and support of the insulators, the character of lightning protection, the switching facilities, the transformer installations, the generator, motor and protective apparatus.

In designing a line each of these elements, as well as various others, must receive careful attention from the standpoint of cost, delivery, installation, repairs and renewal. The best conditions from the standpoint of one element will probably not be the best from the standpoint of another element. The finally accepted design will have to be a compromise among a number of competing aims. Nevertheless, the designer of each should know the best conditions for each element considered by itself and should apply the appropriate formulas for the summarizing of those conditions in arithmetical form.

When we consider the purely electrical side of this large problem of long transmission lines, we recognize that hyperbolic-function theory is the simplest and shortest way to arrive at numerical results. It seems likely, however, that before long it will be recognized as desirable to construct a model artificial line in advance of the actual one and to test its behavior under various and complex conditions simulating those of expected practical service.

# David Barker Rushmore

*An engineer and executive who has helped build the light and power industry and has contributed largely to engineering societies and associations.*

THE magnitude and importance of the power and mining divisions of the electrical industry result from the hard and intelligent work of engineers in these fields. In this work the power and mining department of the General Electric Company has had a large part, and with this department David B. Rushmore has long been intimately associated.

Through his personal influence and work he built up and organized a competent engineering staff for the department, losing no chance to widen its activities. Not the least of his contributions to the department and to industry as a whole has been his power to arouse the enthusiasm of engineers in their work and to put into practice the idea of co-operation between engineers. He has devoted much of his time to engineering society activities and has encouraged young engineers to contribute to their programs. Because of his recent appointment to the consulting engineering staff of the General Electric Company he should be able to contribute still more to the industry from his wide experience and knowledge.

Aside from his executive duties. Mr. Rushmore has found time to specialize on the equipment used in power production and transmission and has contributed many articles to the technical press on alternating-current and direct-current machinery, hydro-electric equipment and high-tension phenomena.

Mr. Rushmore was born in Old Westbury, N. Y., in 1873. After graduation at Swarthmore College (from which school he received the degree of C. E. in 1897) he went to Cornell and gained an M. E. degree in 1895. His early work was with the Pond Machine Tool Company, the Westinghouse Electric & Manufacturing Company and the Royal Electric Company of Montreal. In 1899 he joined the staff of the Stanley Electric Manufacturing Company of Pittsfield, and he entered the employ of the General Electric Company in 1905. Since 1907 he has been the directing head of the power and mining department.

Mr. Rushmore is a fellow of the American Institute of Electrical Engineers, member of the American Society of Mechanical Engineers, American Society of Civil Engineers, American Institute of Mining Engineers, American Mining Congress, National Electric Light Association, New York Electrical Society, Société Française des Electriciens (France), Institution of Electrical Engineers (Great Britain), American Electrochemical Society, American Iron and Steel Institute and various other clubs and organizations.

### Public Enlightenment on Engineering Questions

NEXT in importance to knowing a thing is knowing how to impart the knowledge to others in such a way that they also will know it, and it is this accomplishment that many engineers and educators lack. Indeed, there are few men who, with the gifts of Huxley, can popularize science in a way to make it understood and appreciated. Most leaders in scientific thought, while they do not possess the genius of Einstein, like him are unable to express themselves in a language understood by the rank and file. Unfortunately, many engineers are also in this class.

For example, there was a symposium in New York last week on the possibility of bringing water power to the metropolis. At least half a dozen engineers of wide repute contributed to the discussion, which at the moment is of great popular and political significance. The opportunity for enlightening the politicians and the public was there. There was no question of the competency of those on the program to speak authoritatively, nor was there any doubt of popular interest in the subject matter, and yet the daily papers found little to report. Apparently the discussion was all over the heads of the populace and information on a vital engineering and civic topic sadly needed at this juncture was not obtainable. Reputable and high-class dailies have expressed a willingness and a desire to print more on engineering and scientific matters in their columns. They complain, however, that chief dependence has, in the words of one of them, to be placed on "interested and intelligent amateurs," because experts usually either will not or cannot make themselves intelligible to ordinary readers. News that is of "a nature so technical and abstract that it can be understood only by the possessors of a highly specialized education and a highly specialized language" does not commend itself to the editors of the newspapers. In discussing questions on which the public has a right to be informed engineers will do well to bear the limitations of the layman in mind.

### Radio Has Serious Phases for the Central Station

JUST how deeply radio has permeated daily life was evident at the recent meeting of the Technical Section of the National Electric Light Association in New York City. Naturally, as a topic of conversation, it holds first place with the "fans," but in other and more important ways it wormed itself into most of the committee deliberations.

As an operating asset both straight radio and carrier current received much attention, particularly among those interested in the operation of large transmission systems. As a producer of hazards because of the erection of antennas in close proximity to light and power wires it attracted very serious notice. Complaints from the radio-using public of inductive effects from power systems due both to normal and to abnormal system conditions also came up for discussion.

One may call the development a fad or a craze, but it is apparent from the expressions of central-station operators over the entire country that so long as the development continues it is likely to produce problems for the central-station operator to meet and solve. The situation must be met in each community in accord with local conditions. The N. E. L. A. committee dealing with safety and accident prevention has already recommended definite educational measures concerning the hazards to be avoided, and other committees of the same association have been formed to consider various phases of the development. The situation is such that central-station operators must as a self-protective measure meet it before it becomes so acute that legislative action is threatened.

### Line Wires Shield Each Other from Wind Velocity Effects

THAT a definite shielding effect exists between ice-covered telephone and telegraph conductors carried on the same cross-arm and that a similar shielding effect exists between wires carried on different cross-arms at a distance of about two feet are important conclusions drawn from a series of tests described by P. J. Howe of the Western Union Telegraph Company in a paper presented at the February meeting of the American Institute of Electrical Engineers. The conditions under which the tests were conducted are closely described, and it is indicated that results of these tests should not be made the basis of predicting what might be learned from research work under different conditions of conductor arrangement and cross-arm spacing. It is also held that the amount of shielding on any number of wires increases with the wind velocity and vice versa, and that the shielding at any wind velocity increases or decreases with the number of wires.

The subject is one that has been more or less hotly discussed in arguments over the safety code and crossing specifications. It is only one of several possible factors that may explain the action of lines which, under severe weather conditions, appear to stand up beneath loads that calculations indicate should cause failure. The investigation described by Mr. Howe shows that a very definite shielding effect does exist and that allowances which have been made for this effect in the past are conservative. The paper deserves close study by those interested in the subject of line design and opens a question as to why this type of research work cannot be broadened and the entire subject of loading in the design of lines of all types be investigated in the same way.

Objection frequently has been raised that such research work is expensive, particularly when applied to

any considerable length of line and to heavy lines. The objection is valid, but enough time and money have been spent in fighting over differences of opinion on the subject, without sufficient data on which to base conclusions, to have settled the entire controversy if the expenditures could have been directed into the proper channels. Mr. Howe's paper goes far toward confirming some claims made on the subject of shielding. It hints at possibilities for extending the investigation much farther.

## Engineering Requirements of Switching Deserve Deeper Study

TO THE lay visitor to the bus and switch room of a modern central station during normal operation what could look more peacefully uninteresting than the concrete compartments, switch and instrument mountings and cable runs which usually occupy the foreground of such quarters? The importance of switch-house design is not outwardly apparent as long as conditions are quiet. Even the central-station engineer falls into the habit sometimes of taking this part of his plant equipment pretty much for granted until some unexpected line or station disturbance puts a heavy strain upon the installation and perhaps causes a shutdown of generating machinery or other damage. With the growth of interconnection and loads, it is important to look more closely into the problems of switching and energy control lest disasters to service result from the concentration of excessive power at inadequately protected points.

Not a few companies fail, apparently, to realize that switching facilities by falling behind the requirements of rapidly increasing loads may imperceptibly approach the point of failure until some heavy transient wave of energy causes a breakdown. Confidence in apparatus which has served well for long periods is often too firmly intrenched, considering the magnitude of the systems involved. The importance of analyzing the possibilities of power concentration in connection with the expansion of generating plants and the growth of tie lines and then of investigating the suitability of the existing equipment for continuous operation in the face of these potentialities is, however, manifest.

Such an investigation should include as thorough a study as possible of recurring short circuits and their effects on plant; of the tendency of particular oil switches, bus sections or feeders to develop trouble; of the adequacy of existing switch and instrument transformer cells, dimensions and mountings, including the standards of separation adopted to isolate the effects of explosions, blow-outs, arcing and fires, and of the fitness of particular spacings, types of control apparatus and general arrangement of switch-house detail in the light of existing requirements. The crowding of cables leaving a plant into constricted space, the grouping of exciter lead wiring into a single channel, the proximity of high-voltage wiring to auxiliary cable runs, the warnings of the log-sheet record of minor arcing grounds and failures of terminal apparatus—these and other points obviously deserve frank consideration in studying the adequacy of installations undergoing development.

It is a question whether the wider separation of phases and the complete isolation of adjacent oil circuit breakers, instrument transformers, etc., will insure adequately against disastrous interruptions of service by short circuits which concentrate into such limited space as a single breaker or bus section the huge amounts of energy nowadays on tap in large plants and interconnected systems. Bus and feeder reactors are bound increasingly to receive expert consideration as means of limiting the destructive effects of short circuits in particular installations. Any reasonable means of reducing the strain upon switching mechanisms and of cutting down the force of the "bumps" which abnormal conditions are capable of imposing upon a system deserves careful consideration by qualified engineers. Natural as is the tendency to rely indefinitely upon an existing switch installation or transformer group, it is unwise to put this kind of trust into plant equipment which changing conditions may rapidly be rendering obsolete.

The industry cannot have the benefits of superstations and interconnections without paying the price of modernizing its switching and transforming equipment.

## The Static Condenser in Motor Service

EVERY one well remembers that the early days of the induction motor witnessed a constant struggle with power factor and that about thirty years ago William Stanley introduced static condensers to improve the power factor of his two-phase motors with measurable success. The vicissitudes of motor development, however, shifted the line of activity into another direction, and it was presently found that both two-phase and three-phase motors when loaded could be brought up to a power factor of thoroughly practicable magnitude without any auxiliaries. As time has gone on and motor service has greatly increased, the trouble with lagging current has grown more and more considerable until it again is one of the rather serious problems of central-station working. With the new call for help the static condenser has come back chiefly as an adjunct of the individual motor, and a number of the biggest stations are quietly experimenting to see what the modern condenser intelligently applied will do as a remedial agent.

Some interesting light has been thrown on the situation as it now exists by Clifford W. Bates of the Philadelphia Electric Company. The data which have been made available refer to two-phase motors, but their application to the three-phase form is evident. It goes without saying that a condenser of proper capacity will correct the power factor or even transform the lagging current into a leading one in a perfectly obvious way. Mr. Bates' diagrams are based on the 220-volt motors in customary use, and indeed no one would think seriously of working condensers on any lower pressure than 220 volts. Under these conditions, assuming an average 60-cycle modern motor, the necessary size of condenser can be readily expressed practically by a certain electrostatic capacity per horsepower rating. To obtain unity power factor at full load takes about 15 mf. per phase per horsepower of rating. This, however, gives a leading current at light loads, as might be expected, so that it is probably better to use considerably less condenser capacity—say about two-thirds as much as in the ordinary case.

Just at this point comes up the most interesting part of the investigation: Each harmonic which exists in the electromotive force is responsible for its due cur-

rent effect in the condenser, and owing to the very high frequency of some of the harmonics the ripples caused by them rise to a magnitude which seriously affects measurements of the current and give a net corrective effect which may be materially different from that due to the nominal frequency and condenser capacity. The harmonic effect is considerable at times, so that the actual correction of power factor secured by the condensers may be much less than that expected. The remedy lies in the insertion of a series reactance sufficient to offset the condensance effect on the troublesome harmonics.

The upshot of the Philadelphia investigation is to show very neatly how intricate theory assumes practical importance in cases with which the engineer has to deal. It points still again to the desirability of substantial adherence to the sine wave in alternating-current working. Harmonics will be always with us, but they have no virtues which should encourage their cultivation.

## Some Outstanding Problems of Interconnection

SO MANY sermons on interconnection have been preached in the ELECTRICAL WORLD that it might easily be suspected of turning over the barrel. Just now the matter is coming up in somewhat different form in relation to the working out of physical difficulties which are implied in any large-scale scheme of interconnection. The particular reference is not to the questions of strategy or finance, which in a way are likely to settle themselves, but to those practical difficulties brought about by the outstanding differences of voltage and of frequency which beset any attempt to co-ordinate physically the electric supply systems of a large territory. It is a big problem which has already been tackled here and there and is now being considered on a large scale by a state utility organization in the Northeast.

Passing over the practical advantages of interconnection as such in any large district, and particularly in the eastern part of the country, a very wide variety of voltages are found, as well as three or four frequencies in sufficient use to make their consideration necessary. Of voltages used for primary distribution and transmission there are a dozen or more, representing all the irregular upward steps of working pressure for the last five and twenty years. When it comes to planning a practical general scheme of interconnection, quite aside from any superpower lines, all these divers voltages must be taken into account.

The general feeling is that 66,000-volt lines, which are already common, would form a substantial framework for state interconnections if the lines are constructed so that they can be converted to 110,000 volts when it becomes necessary. The difficulty of voltage relations does not lie here, but in the various lower voltages which form minor systems and which are likely to be involved in any problem of interconnection. As a practical matter the differences are likely to be settled by linking transformers, shifting the load from one pressure to the other. This is the cheapest temporary way out of the difficulty, because transformers are by far the least expensive part of any big plant. Nevertheless, every effort should be made to bring two contiguous systems ultimately to the same standard distributing voltages, because, if they are to interchange on a large scale, it is better to unify the system when this can be done without unreasonable expense than to adopt the mere palliative of arranging to shift part of the power. The cost of special transformers for anything like a complete interchange is likely to outrun the expense of replacing or reconnecting the main transformers of the smaller member. Fortunately, such changes do not generally have to be made all at once and can usually be worked out at a relatively modest expense.

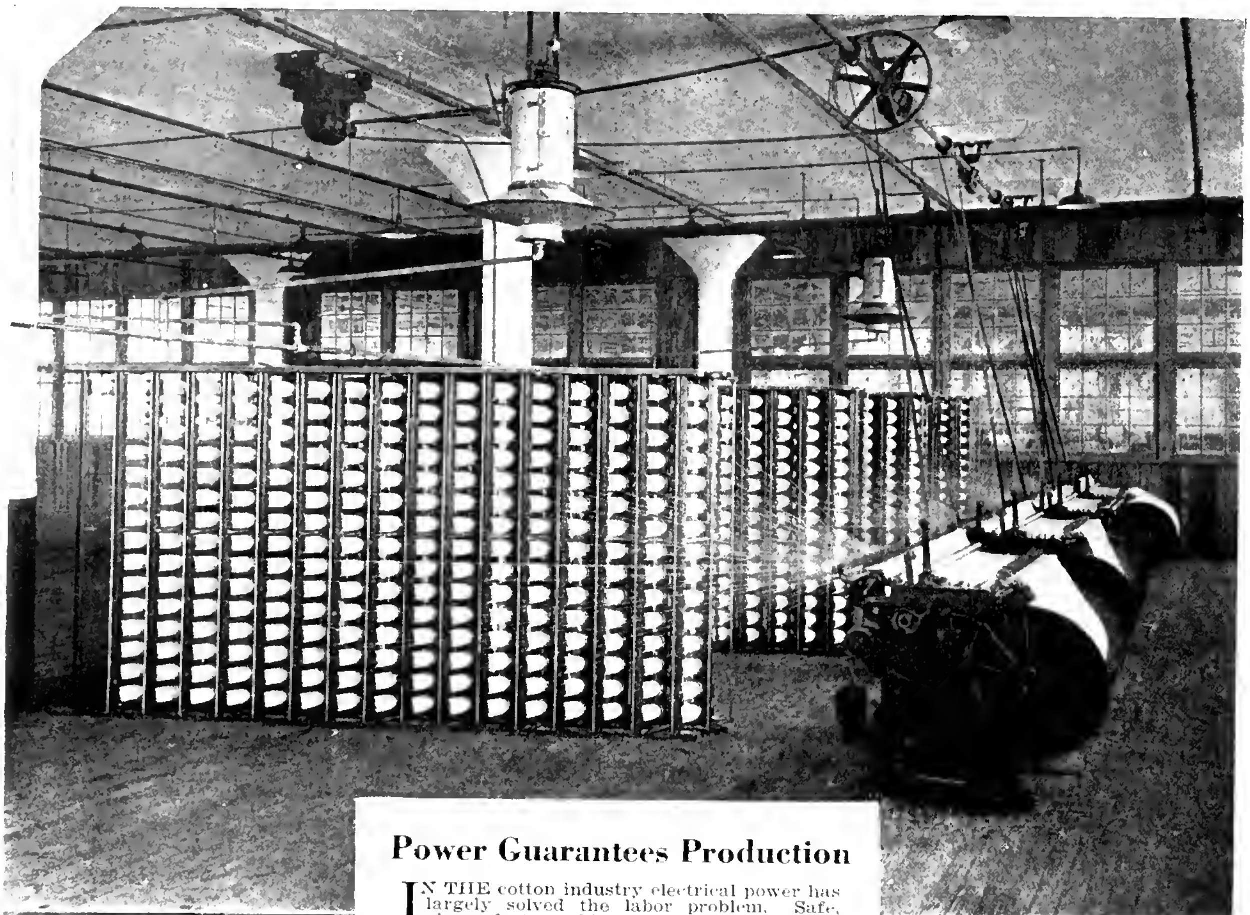
The matter of frequencies is more serious. Frequency changers are expensive, and if a large amount of energy must be interchanged, the costs may run into high figures. Engineers now very well know that the extensive use of 25 cycles in the earlier stages of electric development was a grave mistake. It was not necessary for motor work or for long-distance transmission, and it was positively disadvantageous for lighting of every kind. The unfortunate part of the matter is that the investments in 25-cycle machinery came to be so heavy in the earlier days that a change is financially no small matter. Still, reports indicate that its gradual realization is almost universally expected by the central-station and power-transmission managers who have to deal with interconnection. It is at least safe to say that the various intermediate frequencies are likely soon to disappear in all save some of the very largest systems which have too heavy a stake involved to give them up for the present.

Certainly, a vast deal can be and will be done for the unification of both voltage and frequency. It is a big task which should be undertaken in a nation-wide way to permit exchanges of surplus energy and as a preliminary to the still greater but not necessarily immediate task of trunk-line distribution of energy. Involved in this larger problem as regards frequency is the application of transmitted power to railway working on a large scale. It is time for all to take hold with a will and see how far the undeniable practical difficulties which now exist can be smoothed out by united effort.

Possibly the best mode of attack is for all state or geographical sections of utility organizations to study practical problems and solutions in their territorial situation, working in close co-operation with adjacent territories and the rest of the country through a national committee representing all of the organizations.

## The Salesman as a Good Influence

ASIDE from and beyond all thought of the profits that come from all the selling that the salesmen do, every central-station company needs an active sales department for the influence that it exerts on the rest of the organization. Utility men are apt to be a bit inbred, introspective and prone to look upon this institution of theirs as the thing of chief importance. They have the service to provide. They are the ones to whom the householder must come. And so the salesman's natural commercial attitude, his eagerness to please his customer, his readiness to see the public's side of any argument, acts as leaven in the dough. No man can have his livelihood depend upon the sale of goods without discovering and remembering that, after all, the customer is king.



## Power Guarantees Production

IN THE cotton industry electrical power has largely solved the labor problem. Safe, clean, fast machines have been developed to the extent that attendance is reduced to a minimum. All of the production processes are of a character that require a co-ordination of many movements to secure a uniform and perfect product. The small electric motor and electrical control devices are particularly well adapted to this industry.

# High Efficiency Oil-Burning Station

## Use of Most Economical Equipment Is Just as Important as Though Plant Were Designed for Continuous Full-Load Operation—Graphic Meters Enable Operators to Keep Check on Plant Economy

By C. H. DELANY
*Assistant Engineer of Operation Pacific Gas & Electric Company*

THE necessity for steam-electric generating plants as auxiliaries to hydro-electric systems has been recognized ever since hydro-electric generation became a factor in industrial progress. The Pacific Gas & Electric Company, in addition to its twenty-eight hydro-electric plants, operates four steam plants, the combined capacity of which is about 40 per cent of the capacity of the hydro-electric plants. A new unit added to the company's station "C" steam plant in Oakland in 1920 has shown excellent results in plant economy. On first thought it might appear that for a stand-by station where full load is carried only occasionally it is not worth while to install the most economical equipment. When, however, the matter is considered carefully, it is quickly found that the most economical turbine is just as desirable for a stand-by plant as for a plant carrying a steady load. With an economical turbine fewer boilers are required so that there is a saving in first cost. Then, again, fewer boilers must be kept hot when standing by ready to pick up the full load on the station. As there is a continuous loss due to keeping the boilers hot for this purpose, it is evident that the fewer boilers necessary the more economical the operation of the station will be.

OPEN FEED-WATER HEATERS AND FEED PUMPS USED IN THE STATION

The unit referred to is a 12,500-kw. horizontal turbo-generator and is installed in a station that was already provided with two vertical turbo-generators. The first of these latter units was installed in 1909 at the time the station was built. This was a 9,000-kw. Curtis turbine. A second Curtis vertical unit of 12,000 kw. capacity was added to the station in 1911. There had been no further addition to the generating capacity of the station until 1920, when the new unit referred to above was installed. The two older units were designed for a pressure of 200 lb. at the boilers and 175 lb. at the turbines and a superheat of only 100 deg. F. With the advance in steam pressures that has occurred during the last few years, it was felt that a higher pressure and temperature should be adopted for the new unit. A separate installation of boilers was therefore made, built for a pressure of 250 lb. and 150 deg. F. superheat, and the turbine was designed for 225 lb. pressure at the throttle.

This station, being an auxiliary to a very large hydro-electric system, has a greater variation of load than is ordinarily found in a steam station. First, there is the seasonal variation due to the change in the amount of water available for the hydro-electric plants. The climate of California is unusual in that there is practically no rain during the summer months, so that the hydro-electric stations must depend on the winter rains and snows, together with whatever water-storage systems are available. Fortunately, the mountains in California are so high that the winter snows are not melted until late in the summer, so that the greatest storage is obtained from the deep beds of snow lying on the mountains during the spring and early summer. In addition reservoirs have been constructed in connection with several of the hydro-electric plants, but there are many other plants where there is no artificial storage. Consequently, as soon as the stream flow is reduced by the disappearing of the snow in the mountains many of the hydro-electric plants are unable to deliver their full quota of power to the system, and it is then necessary for the steam stations to generate up to their full capacity. On the other hand, during the early spring and late winter, when heavy rains occur, there is a large run-off available for the hydro-electric plants, so that at this season of the year the generation of the steam plants can be kept down to a minimum. There is thus a variation in steam generation of from only 6 per cent or 7 per cent of the total monthly generation of the system in the spring up to more than 50 per cent of the total generation during the late summer and early fall.

In addition to this seasonal variation there is a daily variation due to the usual daily change in the lighting and industrial load. All electric systems have their lowest load in the early morning hours, between midnight and 6 a.m. In the case of the hydro-electric

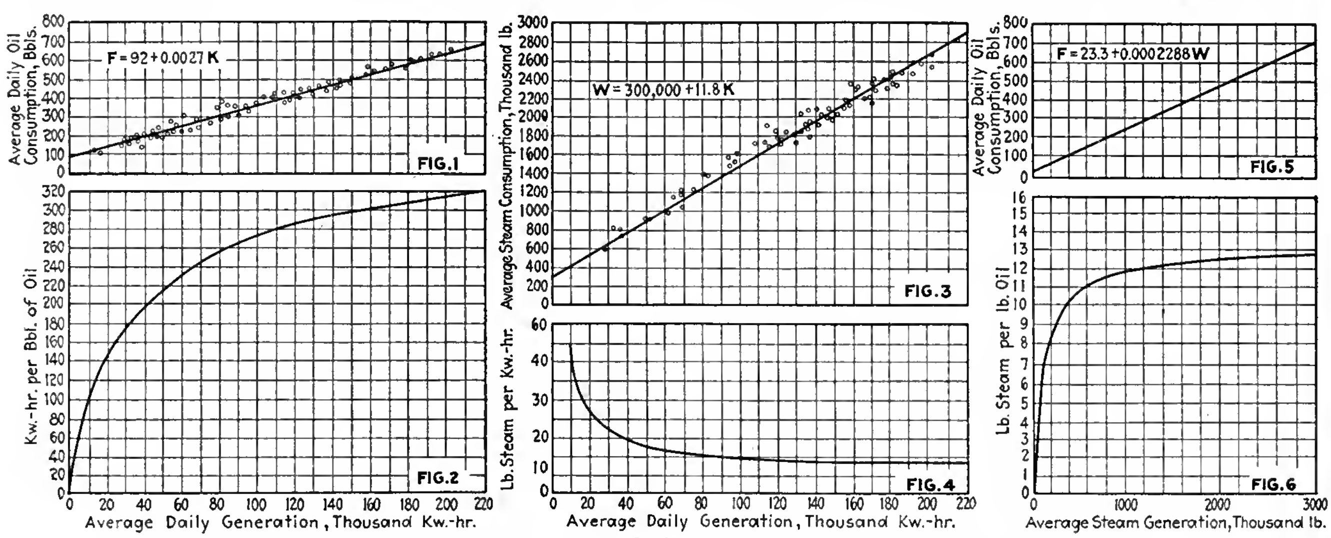
system this light load is less than the capacity of the hydro-electric plants, and if any of the power at this time of day is generated by steam, there is an economic loss, owing to the fact that the water available at the hydro-electric plants flows on without being used. Consequently it is customary to reduce the loads on the steam plants to zero during the early morning hours. In other words, the steam plants take the brunt of this daily variation in load. Besides the seasonal and daily variation in load, there is always the possibility of a sudden change in load on the steam plant due to trouble developing on the many miles of transmission lines passing over rough country and exposed to storms of all kinds. The steam plants are, therefore, kept in readiness to pick up instantaneously a load equal to their full capacity. This frequently causes very sudden peaks to occur for short periods of time.

Owing to these sudden demands for power and extreme variation in load, the operation of auxiliary steam plants is more difficult than the operation of ordinary steam plants supplying the entire power for a public utility. Liberal boiler capacity must be installed to enable the station to pick up the sudden load without loss of steam pressure, and in the operation of the boilers it is necessary to take special means of keeping them hot ready for these emergencies. Fortunately, the fuel used in California is oil, which has many advantages over coal in connection with the sudden taking on of extra load and the elimination of stand-by losses in the boiler room.

### Description of Equipment

Briefly, the equipment installed in connection with the new unit is as follows: The turbine is a horizontal G.E. 12,500-kw. unit, operating at 1,800 r.p.m., directly connected to a three-phase, 60-cycle, 12,000-volt generator. The condenser is of the surface type, containing 25,000 sq.ft. of cooling surface, designed to produce 28½ in. of vacuum when using salt water at a temperature of 60 deg. There are six Stirling boilers rated at 823 hp. each, erected in three batteries of two boilers each and equipped with superheaters for 150 deg. F. superheat. Each battery is provided with a steel smokestack 90 in. in diameter and 150 ft. in height. The boilers are provided with steam-atomizing oil burners capable of operating them at 150 per cent of their rating. With this overload it is possible to carry the full load on the turbine with only five boilers, so that one boiler may be shut down for cleaning and overhauling at any time. This makes the full capacity of the turbine always available for the system and facilitates the maintenance of the boilers.

In addition to the main units, the installation includes all auxiliary apparatus necessary for a complete power plant. The condenser auxiliaries include four "rado-jets" for removing the non-condensible gases from the condenser, two hot-well pumps, one motor-driven and one turbo-driven, and a circulating water pump driven by a geared steam turbine. The circulating pump is connected into the main circulating system of the plant, which was already provided with one motor-driven and one engine-driven pump. These pumps deliver into a common main which supplies water to all three condensers. Thus a main unit is never dependent upon a single circulating water pump for its supply of cooling water. An oil filter is provided to filter the lubricating oil for the turbine, using the well-known continuous bypass system. The generator is provided with an air washer to insure that the cooling air shall be pure and clean. The two older steam turbines in this plant are also equipped with air washers, and the three air washers are connected to a single pumping system for their water supply.



FIGS. 1 TO 6—OPERATING RESULTS OF A 12,500-KW. TURBINE FOR A NINE-MONTH PERIOD

The boiler auxiliaries consist of feed-water pumps and feed-water heaters, oil pumps and oil heaters. The two feed-water heaters are of the open type. This type of heater is of material assistance in purifying the feed water, as the air and dissolved gases are driven out of the water when it is heated at atmospheric pressure, and moreover some of the scale-forming matter in the water deposits in the heaters instead of being carried on into the boilers. The heaters are provided with large storage compartments, so that an ample supply of pure hot water is available at all times. The heaters are set on an elevated platform to give ample head to the feed pumps. The feed pumps are of the centrifugal type and are driven by steam turbines. The oil heaters are of the coil type having external joints so that any leak in a joint of the coil is immediately noticed and can be promptly stopped. The oil passes through the inside of the coils at a high velocity, and thus a good heat transfer is obtained. The oil pumps are of the piston reciprocating type and each pump is of sufficient size to supply fuel oil to the whole plant, the old boilers as well as the new. The fuel-oil storage tank has a capacity of 15,000 barrels and is

surrounded by a concrete retaining wall of sufficient capacity to hold its entire contents in case of a leak, thus protecting the surrounding property.

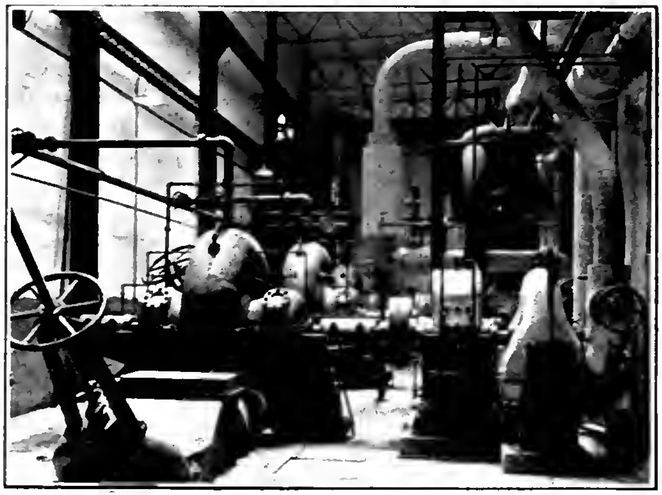
### Graphic Meters Used

An important feature of the installation is the extensive use of measuring devices that have been provided for keeping records of the efficiency of the plant and assisting the operating men in knowing just what results they are obtaining. In modern engineering practice it is becoming more and more apparent that a complete installation of meters is essential to securing high efficiencies of steam plants. Each boiler is equipped with its own individual flow meter. Each meter is practically three separate meters in one case, but all three record their information on one and the same chart. The steam-flow part of the meter records the steam output of the boiler in percentage of boiler rating, showing at a glance just what load the boiler is carrying. On the same chart the air-flow pen records the amount of air the fireman admits to his furnace and fires. The air-flow mechanism is entirely separate from the steam-flow mechanism, with the exception that the records are traced on the same chart. By means of an Orsat gas analyzer the flue gases are analyzed and the fires and air supply are adjusted to give the desired amount of excess air and $CO_2$. The air-flow mechanism of the meter is then adjusted to coincide with the steam-flow record at the existing rate of steaming. This setting is then checked at different rates of steam output to make sure the adjustments are correct. In the same meter casing, and recording on the same chart, a thermometer is provided that indicates and records the temperature of the superheated steam. This consists of the well-known nitrogen bulb and flexible tube connected to a helical spring which actuates the recording pen. This record shows any defects in the superheater, or any water that may be carried over with the steam.

The feed water supplied to the boilers is measured by a flow meter connected to the feed line between the pumps and boilers. This meter is equipped with two recording pens and an integrator. One of the recording pens shows a continuous record of the flow of water from the feed pumps to the boilers. The second pen shows on the same chart a continuous record of the feed-water temperature. The integrating attachment works in conjunction with the mechanism that records the rate of flow of the feed water and records the total flow of water fed into the boilers during any period of time. From this information the evaporation per pound of fuel burned and the total steam used in the plant per kilowatt-hour generated may be determined. Another Bailey meter, type C-6, is provided on the hotwell discharge line to measure the condensate from the main turbine. This meter has only one recording pen and an integrator, the recording pen showing at all times how much water is leaving the condenser, and the integrator giving the total flow for any period of time. From the records of this meter the water rate of the turbine may be determined.

### Steam Flow Meter Used

The steam supplied to the oil burners is measured by an integrating, indicating and recording flow meter. The indicating scale being visible for some distance, the fireman is always able to tell how much steam he is using to atomize his oil, without having to walk up to the meter to read it. The recording pen shows a continuous record of how the fireman handles his steam, and the integrating attachment gives the total steam passing by the meter in any period of time. From these records the percentage of atomizing steam to total steam generation and the pounds of steam used for atomizing per pound of oil burned may be readily calculated. The total oil supplied to the boilers is measured in the oil-storage tank and by oil meters. Owing to the fact that the oil pumps supply both the new and the old sections of the plant, it is necessary to use oil meters to determine the amount of oil used in the two sections of the station. Two oil meters are provided, one for the old and one for the new portion of the plant. The total of the readings of these two meters is checked against the measurements of the oil-storage tank, and any difference is proportioned as a correction of the two meters. The total of the two meters checks closely the oil-tank measurement.



CIRCULATING-WATER PUMP WITH A CAPACITY OF 30,000 G.P.M. THESE PUMPS DISCHARGE INTO A COMMON MAIN FOR SUPPLYING THE THREE CONDENSERS

### High Efficiency Obtained

The results obtained from the operation of the unit are shown in the accompanying diagrams. Fig. 1 shows the daily generation in kilowatt-hours plotted against the average daily oil consumption. Each point in the diagram represents one day's operation as taken from the daily records. The straight line drawn

OIL BURNERS ARE INSTALLED ON SIX 8,230-SQ.FT. STIRLING BOILERS

through these points represents the average performance of the station. Fig. 2 shows kilowatt-hours per barrel of oil as determined from the average straight line of Fig. 1. Fig. 3 shows the generation in kilowatt-hours plotted against the average steam consumption of the plant. The steam consumption shown on this diagram is taken from the records of the flow meter on the feed-water line, corrected by deducting estimated amounts to allow for blowing down the boilers. This steam consumption, therefore, includes the steam used by the auxiliaries as well as by the main turbine. Fig. 4 shows the pounds of steam per kilowatt-hour as deduced from the average straight line drawn through the points of Fig. 3.

FIG. 7—WEEKLY EFFICIENCY REPORT FOR A STATION UNIT

The straight line in Fig. 1 may be represented by the equation.

$$F = 92 + 0.0027\,K$$

where $F$ = barrels of fuel oil burned in twenty-four hours and $K$ = kilowatt-hours generated in twenty-four hours.

If the plant operates purely as a stand-by without carrying any load, $K$ becomes zero and $F = 92$. This means that 92 barrels of fuel oil a day is required to operate the plant at zero load. When the plant is generating, there is an additional oil consumption of 0.0027 barrel for every kilowatt-hour generated. If the plant were operated at full load for twenty-four hours the total generation would be 300,000 kw.-hr. and the oil consumption would be $92 + 0.0027 \times 300{,}000 = 902$ barrels. The economy of the station, therefore, at full load is equivalent to 332 kw.-hr. per barrel, or 1 kw.-hr. from 18,700 B.t.u. While this figure has never been maintained for twenty-four hours, owing to the variation in the load, it has been very closely approximated for periods of eight hours.

The straight line drawn through the points of Fig. 3 may be represented by the equation

$$W = 300{,}000 + 11.8\,K$$

where $W$ is the pounds water evaporated in twenty-four hours and $K$ is the kilowatt-hours generated in twenty-four hours. For zero load $W$ is equal to 300,000, which is the quantity of steam required to keep the main turbine and auxiliaries turning over. In addition to this, 11.8 lb. of steam is required for every kilowatt-hour generated.

By combining the two equations mentioned above and eliminating $K$ it is possible to obtain a relation between the oil consumption and the steam generated. This relation is shown by the equation

$$F = 23.3 + 0.0002288\,W.$$

The straight line derived from this equation has been plotted in Fig. 5, and Fig. 6 shows the pounds of steam evaporated per pound of oil as calculated from the same equation. In this last equation if we let $W$ equal zero, we have $F = 23.3$, which means that if no steam is taken away from the boilers, it is necessary to burn 23.3 barrels of oil per day merely to keep the boilers hot, ready to generate steam when required. In other words, the stand-by losses in the boiler room, or what in coal-burning plants is commonly called the "banking loss," amounts to 23.3 barrels of oil per day. The difference between this figure and the 92 barrels which must be burned per day to keep the machinery turning over, namely 68.7 barrels, represents the engine-room stand-by loss due to the steam required to run the main turbine at zero load and keep the auxiliaries in operation.

Owing to the fact that this is largely a stand-by plant, the figures for zero load as deduced from the diagrams are of particular interest. The excellent results obtained from this station are due in some measure to the methods of keeping records and tabulating results in its operation. Fig. 7 shows the weekly efficiency report blank. This report tabulates for each day the more important data entering into the question of efficient operation. The data for the various items mentioned are obtained from the measuring instruments already described. The items given are confined to such information as is of assistance in checking up efficiency and ascertaining where the losses occur. The third item on the efficiency report, "Oil required, standard," represents the average oil required for the particular load on the day under consideration. This average is obtained from the straight diagonal lines given in Fig. 1. The operating efficiency is the ratio of the standard oil required to the oil used. This item, therefore, gives an exact comparison of the result obtained each day with the average results over a considerable period of time, thus enabling the men in charge of the plant to keep a check on themselves and assisting them to keep the efficiency of the station up to par. A report of this nature is found to be of great help in maintaining the efficiency of the station.

# Power-Factor Correction with Static Condensers

## An Analysis of the Use of Static Condensers for Power-Factor Correction at Individual Motors Shows that Harmonics May Affect Performance—Excess Current Varies with Voltage Wave

By CLIFFORD W. BATES
*Research Engineer Philadelphia Electric Company*

WHETHER to apply power-factor corrective devices at the substation, near the customer's service switch or at the individual motors is a question much discussed by central-station engineers, but equally pertinent questions arise as to the actual performance to be expected if static condensers are used at the individual motors. An analysis of the effect to be expected when using static condensers at individual motors of a size sufficient to warrant the employment of a single power-factor correction device shows worthwhile results which appear in the accompanying curves.

These curves apply directly to 220-volt, 60-cycle, two-phase induction motors, and the calculations are based on a 20-hp., 900-r.p.m., squirrel-cage motor of normal design. Since the characteristics of all induction motors of normal design are very similar for all sizes from 5 hp. to 200 hp., this motor is typical of all squirrel-cage motors except those wound for abnormally low speed.

Condensers of equal capacity are connected across the terminals of each phase of the motor and are therefore connected to and disconnected from the lines simultaneously with the motor.

The variation of power factor with the load on an induction motor of fixed size is shown in Fig. 1. Each individual curve shows the change for a fixed value of capacity. The value of the capacity is expressed in microfarads per phase per horsepower of the motor rating. For example, in applying these to a 20-hp. motor the curved marked 6 corresponds to 120 mf. per phase or 240 mf. for the entire motor.

It will be seen that a condenser of practically 15 mf. per phase per horsepower is required to give unity power factor at full load, but a condenser of this size will cause a leading current at smaller loads. A condenser of about 11 mf. per phase per horsepower will just compensate the magnetizing current of the motor at no load and will hold the power factor up to 99 per cent, or slightly higher at full load. This size, therefore, is preferable as it is cheaper.

In Fig. 2 is shown the relation between the total kilovolt-amperes input (both phases) and the load of induction motors operated in parallel with condensers of various sizes. The size of condensers is expressed in the same way as in Fig. 1. The line current is proportional to the total kva. and may be found by dividing the total kva. by 0.44 or multiplying by 2.27 to obtain the current per terminal.

These curves assume an approximate sine wave of current in the condenser. This is almost never the case unless inductive reactance is used in series with the condenser of each phase. The reason is: The voltage applied to a condenser contains small deviations from a sine wave, due to tooth ripples produced by the generator, to magnetic saturation or to other causes. This is equivalent to the simultaneous application of voltages of various frequencies, each of which will produce its current in the condenser proportional to the magnitude of the voltage and to the frequency. A ripple which is hardly noticeable in the voltage wave will, therefore, be magnified enormously in the condenser-current wave. For example, a 5 per cent eleventh

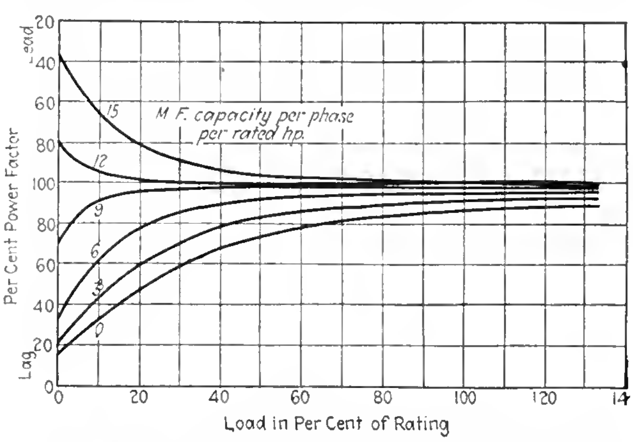

FIG. 1—RELATION BETWEEN POWER FACTOR AND LOAD OF 220-VOLT, 60-CYCLE, TWO-PHASE INDUCTION MOTORS IN PARALLEL WITH STATIC CONDENSERS OF VARIOUS SIZES

harmonic ripple in the voltage will cause a 55 per cent eleventh harmonic ripple in the condenser current.

If the capacity of the condensers is measured with alternating current, using an ammeter and a voltmeter, the apparent capacity will be too high, since the measured current will include the harmonics as well as the fundamental sine wave. (The current as measured by an ammeter is the square root of the sum of the squares of the currents of all of the component frequencies.) If the condenser measured as above is applied to an induction motor and a power factor test is made of the combination, the current as measured will again be too large by these harmonics, and the apparent power factor will be too low. The result, therefore, is that the apparent correction is not so large as the actual correction (based on the fundamental frequency), and the actual correction is smaller than is anticipated from tests on the condensers. The resulting correction may, therefore, be very different from that expected.

The excess current due to the harmonics will vary of course with the wave form of the voltage, but in the absence of specific information regarding the presence or absence of any particular harmonic it is necessary to provide for the elimination of all harmonics. This may be accomplished by introducing

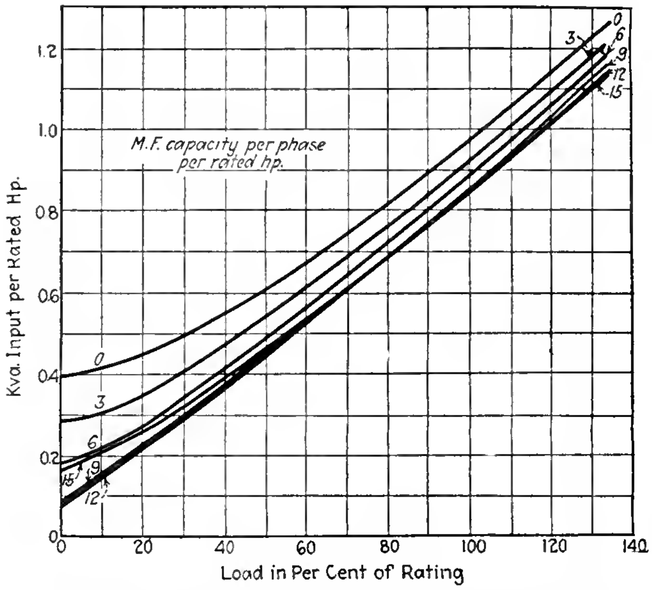

FIG. 2 — RELATION OF KVA. INPUT AND LOAD OF 220-VOLT, 60-CYCLE, TWO-PHASE INDUCTION MOTORS IN PARALLEL WITH STATIC CONDENSERS OF VARIOUS SIZES

inductive reactance in series with the condensers. In the case of high-voltage condensers this inductive reactance may be supplied by the transformers introduced between the condensers and the load.

Calculations have been made based on certain assumptions which show in general the possible magnitude of this effect. The assumptions made were that all harmonics up to the twenty-first were present to some extent, their magnitude being, in percentage, as follows (fundamental 100 per cent): Third, 5.0 per cent; fifth, 4.5; seventh, 4.0; ninth, 3.5; eleventh, 3.0; thirteenth, 2.5; fifteenth, 2.0; seventeenth, 1.5; nineteenth, 1.0; twenty-first, 0.5. The further assumption was made that the resistance of the circuit was equal to 10 per cent of the inductive reactance. The magnitude of the disturbance was calculated for various values of inductive reactance varying from zero to 20 per cent of the condensive reactance.

In addition to eliminating the harmonic currents, as discussed later, the introduction of inductive reactance affects the fundamental current also. When inductive reactance is introduced in series with condensive reactance, the net result is equivalent to the use of reactance whose ohmic value is equal to the difference of the reactance values, which is either inductive or condensive in character, according as the one or the other is the larger. This value will be affected by a change of circuit frequency, but that does not affect the present discussion, as the fundamental frequency is fixed.

Since the inductive reactance is always small compared with the condensive reactance (for fundamental frequency), the net result is equivalent to the use of a larger condenser which has a smaller reactance. Consequently, a smaller condenser may be used when the inductance is introduced. Numerical values may make this clearer. Suppose that an inductive reactance of 20 per cent is connected in series with a condensive reactance of 100 per cent. The net result will be an equivalent condensive reactance of 80 per cent, which would pass 125 per cent of the original current. Both the inductive and condensive reactances should, therefore, be increased by 25 per cent in order to limit the current to the original value. The increase of condensive reactance corresponds to a reduction of the condenser capacity of 20 per cent. It should be noted, however, that the voltage impressed on the condenser is increased by the partial resonance to a value of 125 per cent of the line voltage, the inductive reactance absorbing 20 per cent of this, leaving a net result of 100 per cent of line voltage impressed on the combination.

If the condensers originally used will stand this increased voltage with a suitable margin of safety, a net saving in cost is made; but, if not, a condenser suitable for higher voltage must be used, which may be more expensive.

The reactance for each harmonic frequency is changed according to the order of the harmonic. For the third harmonic the inductive reactance will be three times its fundamental frequency value and the condensive reactance will be one-third.

If the inductive reactance is less than 11.1 per cent of the condensive reactance (for fundamental frequency), the net result is a lower reactance, capacitative in character, and a large third harmonic current will pass. At exactly 11.1 per cent the reactances neutralize each other and the current for this harmonic is limited only by the resistance of the circuit. This is shown in Fig. 3, where under the assumptions made the total current reaches 4.13 times the fundamental current. As the inductive reactance is further increased the net reactance increases rapidly, so that at 20 per cent inductive reactance the excess current due to all harmonics is only 1.2 per cent of the fundamental current. Similar resonance occurs with each harmonic at the appropriate value of inductive reactance.

The figure shows that in order to reduce the harmonics which may exist in a condenser circuit to a negligible value an inductive reactance must be introduced in series. Its value must be somewhat higher than that at which third harmonic resonance occurs, which is 11.1 per cent. The correct value for ordinary purposes is seen to be 18 to 20 per cent of the condensive reactance.

It should be noted that the total current which will be passed by a voltage of the assumed wave form will be about 27 per cent in excess of the fundamental if no inductance is used. This will increase very rapidly with the addition of small inductances, such as might be due to line reactance, current transformers, trip coils, etc., but as the inductance is further increased the excess becomes negligible.

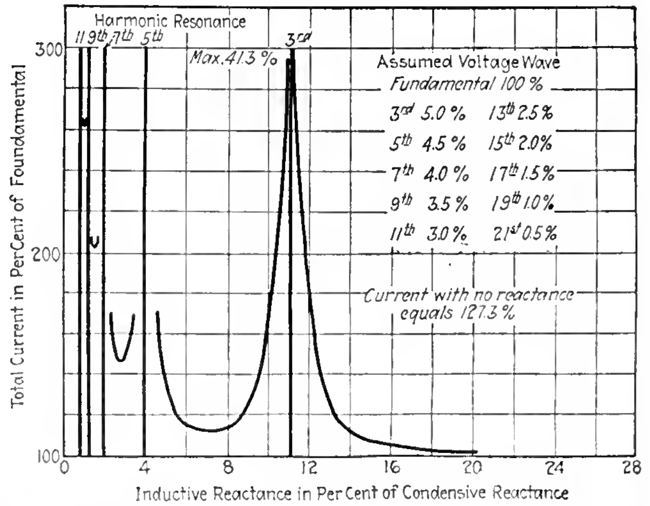

FIG. 3—EFFECT OF INDUCTIVE REACTANCE ON SUPPRESSION OF HARMONICS, THE VOLTAGE WAVE POWER APPLIED TO THE CONDENSER BEING ASSUMED

The curves of Figs. 1 and 2 may be applied to three-phase motors by considering each curve to correspond to a condenser of two-thirds the size as marked, since the total condenser capacity required will be the same for either two-phase or three-phase motors of normal design. The curves may also be used for other voltages by dividing the marked size of condenser by the square of the ratio of the other voltage to 220 volts. For example, if a 440-volt motor were to be investigated, the capacities as marked should be divided by $(440/220)^2$ or 4.

For other frequencies the marked capacity must be multiplied by 60 and divided by the new frequency. For example, to apply to 25-cycle motors, 2.4 times as much capacity would be required, provided the motor characteristics were the same. The characteristics of motors for various frequencies are somewhat different, however, so that the results so obtained might be considerably in error.

The condenser installation must be fused to avoid trouble if a condenser unit breaks down, and this should be done either by fusing each unit or by fusing in groups small enough so that if a fuse blows it will not cause a large decrease in the connected capacity.

An inductive reactance large enough to avoid resonance with all harmonics should be introduced in series with the condensers of each phase. The value should be 18 to 20 per cent of the value of the condensive reactance. This will pass an increased current, permitting the reduction of the condenser capacity. The voltage impressed on the condensers is also increased, requiring operation at a lower factor of safety or the substitution of condensers suitable for the higher voltage.

# Interconnection a National Problem

## Work of the Character Proposed for New York Might Be Copied by Other State Utility Organizations and the Entire Problem Coordinated Under a Committee Representing All State Organizations

WHEN any one looks at a transmission map of his own state showing the various frequencies and primary voltages employed, it may be readily seen that each system has been developed in itself without much forethought being given to possible connection with adjacent systems. Still, most engineers will admit that the most economical utilization of water power and steam plants of different efficiencies, the reduction of reserve equipment and the assurance of the most reliable service under difficult circumstances will be made through more extensive interconnection of adjacent systems.

Recognizing these facts, the transmission lines committee of the Empire State Gas and Electric Association, E. P. Peck, chairman, is starting to consider the possibilities of greater interconnection in New York State. There has been no agreement between any of the companies, and no plan made by any of the companies, in the direction of standardization or interconnection. At present representatives of some companies have shown their willingness to start working on a plan, but even these representatives have not committed themselves to any specific plan and cannot do so until such a plan is drawn up by the committee. Many of the benefits which the New York companies can contemplate through further interconnection can be realized in other sections of the United States, and the method of procedure proposed by the Empire State committee chairman may be enlightening to other groups of companies which are closely related physically.

Mr. Peck made the following statement in starting this new activity of the transmission lines committee:

"There are several outstanding advantages in greater interconnection, some of which apply particularly to New York State. In this state are some very large hydro-electric plants with a continuous power supply throughout the year. Other hydro plants have very large pondage but are subject to seasonal variations. Still other hydro plants are subject to daily and even to hourly changes in available capacity due to variations in the stream flow. There are also steam plants, from the largest to the smallest, under almost every known condition of load factor in operation.

"Substantial interconnection between these various classes of plants," Mr. Peck went on to explain, "would make it possible to load the continuous power plants with continuous loads, load the stream-flow plants with loads in proportion to the available water, and let the plants with storage save water at times when the other plants can carry a part of the load, thus permitting them to carry larger loads during the heavy load hours. The operation of steam plants would, of course, vary with conditions, but their operation would be largely reduced, with a resulting saving in cost and in coal.

"Substantial interconnection makes it possible to take advantage of a large part of the diversity of different classes of load, thus reducing the total generating capacity required for instantaneous demand. Such interconnection would go far toward relieving power shortage experienced by some companies due to low-water years. A large insurance would be effected against accidents to station and transmission line equipment in the existing systems. Interconnection would often make it possible for one company to postpone the construction of a new plant, as it could take load from some other system which might have recently installed a large plant, thus helping the system with the new plant to carry its plant charges and postpone an investment in its own system. The actual operating advantages are so tremendous that they cannot all be realized at a glance, but it appears safe to say that no companies that have gone into interconnection on a broad scale have ever found it advisable to discontinue these connections.

"Public service corporations must adopt every possible means of reducing cost, and interconnection offers many systems the greatest possible means of affording economies in investment and in operating costs. Economically, the combining of resources is the correct move. It can be delayed, but cannot be delayed indefinitely. The force of economic pressure will undoubtedly in time require that resources be combined.

"Assuming, then, that combination of resources—that

## A National Committee on Interconnection Needed

*By E. P. Peck*

Chairman Transmission Lines Committee,
Empire State Gas and Electric Association

THE matter of interconnection is not a state problem at all, but is a national problem. What is done by any company in New York State may have a very definite bearing on the future of some other company in a relatively distant state. It is a national problem, and if there is any way to start national work in this connection it should certainly be started. In fact, I think the N. E. L. A. could not do better than to appoint a committee to do the same thing for the country as we have started to do for the state. Such a committee would probably first collect data from the country at large. Then it would pick out certain districts where more general interconnection might logically begin and make recommendations for these districts, one at a time.

In our state work we have found it very advisable to keep entirely away from the question of a superpower line in any form or in any location, recognizing, however, that such high-voltage trunk lines must come and that our plan must be such that it will be a logical part of the general system when it is completed.

The work of the national committee may or may not have the same limitations. That, of course, would have to be decided after the conference with the interests concerned.

The national work would be a tremendous undertaking. In fact, it is so large that one may wonder whether the N. E. L. A., with all of its facilities, would undertake the job. However, the results of such a piece of work would be so far-reaching and would save so many hundred million dollars that the effort would be insignificant compared with the return. This assertion, of course, is based on the assumption that a really workable report with recommendations would be made and that the individual interests and companies would consistently follow the recommendations in all of their new construction.

As I see it, no piece of work ever started has been of such size or of as great importance to the industry as this one would be.

is, interconnection—must come, it immediately becomes obvious that there must be some common ground on which different systems can meet. If recommendations can be made which will serve as a guide to all companies interested now or in the future, the thing that apparently must come will come much quicker, much more easily and at a much lower cost. This assumes, of course, that workable standards be set up, that workable recommendations guiding the use of these standards be made, and that the different systems adopt and work in the direction of these standards and recommendations.

"It would seem advisable to set up a plan, perhaps not ideal, because there are too many conflicting factors involved, but a real engineering, working plan. The business and financial end would, of course, be of the greatest importance, but those problems are entirely solvable and do not come within the scope of this committee's work. Recommendations should not be in the direction of applying force to any existing system, but should show a way whereby existing systems can in the future line up, with greater or less speed, with the other systems. There are difficulties, both engineering and financial, but no system, regardless of its size, is larger than the men within it have made it. No system, therefore, is so large that its engineering and its growth cannot be directed by the men in control.

"To get into the details of the problem," Mr. Peck went on, "it would be advisable to divide the work among the following sub-committees: (1) Load, distance and voltage; (2) frequency; (3) line and substation costs; (4) liaison committee with other states. The work of the different committees would be about as follows:

"*Load, Distance and Voltage*—The committee on load, distance and voltage would have the problem of selecting the proper voltage for the lines which will make up the interconnected system.

"This would involve a study of the territory covered by each of the major systems, the distance from the load center or main generating center to the outskirts of that system, the distance between load centers of adjacent systems, the amount of load to be carried from the load center to the outskirts of each individual system and the amount of load which it appears necessary to provide for interconnection between adjacent systems. One very important point to be considered in this connection in the distance between substations, which probably would connect to the primary lines. After considerable study along this line, it is believed that 66,000 volts is the proper voltage for this purpose.

"Running through the whole plan is a background of a trunk transmission line at some much higher voltage which it appears must materialize at some time in the future. A company entering into the interconnection plan could start its work by building all new structures, both substation and transmission, for the recommended voltage. It could buy transformers and major pieces of substation equipment arranged so that it could operate on the voltage now in use but be reconnected later for the standard voltage. In this connection it has appeared advisable to put up all permanent structures so that they could be used later for 110,000 volts, though 66,000 volts appears to be proper for present and future needs.

"*Frequency*—The frequency committee may find it advisable to make a survey or take advantage of a survey which has already been made showing the amount of territory covered by systems of each frequency and the total load carried by systems of each frequency, with an indication of the stated future policy of the systems with regard to the frequency they have adopted for future work. In this connection it would be of value to obtain from the manufacturers statements of the amount of apparatus going through the works or the volume of apparatus manufactured in the past year for each of the frequencies considered, that is, 25, 40, and 60 cycles. They should, if possible, agree on the standard frequency for new work. Evidence indicates that 60 cycles is the frequency for the future.

"*Line and Substation Costs*—This committee should determine the comparative costs of lines and substations for different voltages which most logically could be used for the interconnection, presumably 66,000 and 110,000 volts. Of course, features other than cost may determine the recommended voltage, but a set-up of comparative costs would be of value in the report.

"*Liaison Committee*—While it is true that the work of this committee is necessarily confined in its recommendations to New York State, it is equally true that interconnection cannot stop at the state line. We are vitally interested in knowing what Connecticut, Vermont, Massachusetts, New Jersey and Pennsylvania are planning to do, and each of these states is or will be interconnected with other states. We should, therefore, be in touch with at least the larger companies in the surrounding states to find out what they are doing."

# Electric Sign-Hanging Regulations

## Chicago Adopts a Safety Factor of Nine for Suspension Chains, Minimizing Risk of Signs Falling—Position of Sign Determines Method of Support—Location of Expansion Bolts Important

By HENRY C. HORSTMAN and VICTOR H. TOUSLEY
*Department of Gas and Electricity, City of Chicago*

ELECTRICAL signs in a large city have come to play such an important part in the electrical industry that without proper regulation most such installations would soon become hazardous. Rules for such regulation should consider the construction of signs, their mechanical strength, their factor of safety and their final location. All these items have been considered in the Chicago rules which were adopted in 1902 and amended from time to time. Another reason why regulation is needed is because the number of signs is growing daily. For the first eight months of 1922 the number of permits issued in Chicago was 2,631. In 1921 a total of 12,476 signs, with an aggregate of 963,151 electric lamps, were in operation. Because most of this business is solicited by central-station companies and electrical contractors they must be held responsible for the proper hanging as well as the electrical work. This is distinctly important since falling signs would tend to jeopardize the entire business.

The most common types of electrical signs are depicted in Figs. 1 to 11, which also show the usual means of support. Signs may be built about strong frames of angle iron, but in many cases they are merely light boxes constructed of No. 28 U. S. gage sheet metal. Where wooden signs are permitted, they are usually constructed of 2-in. x 4-in. or 2-in. x 6-in. timbers, to which ⅞-in. boards are fastened. The weight of a typical all-metal sign ranges from 3 lb. to 10 lb. per square foot, although 5 lb. per square foot perhaps is a fair average. Some of the smaller signs are often suspended from pipes and arranged to swing under them.

The number of chain supports per sign, the manner of attachment and the number and descriptions of chains and rigid braces used for guying are given in Tables I to IV. Table I shows the number of supports required, calculated on a basis of a 30-deg. angle for supporting chains, which makes the stress upon the chains equal to about two and two-tenths times the weight of sign. The chains are also calculated with strength enough to carry the total weight of the sign with a minimum safety factor of nine. The total weight of a sign has been taken as a basis because in many cases it is actually carried by the chains, and to make allowance for less might lead to more trouble than the saving was worth. A high safety factor is advisable because even the best galvanizing does not stand up well in large cities burning soft coal. The use of substantial chains as supports is, furthermore, of value in creating a feeling of confidence.

TABLE I—CHAIN SUPPORTS FOR SIGNS*

Each chain must be capable of carrying sign alone. Supports must have at least 5 ft. of wall above them and be 8 in. from corners.

| Weight of Sign, Lb. | No. of Chains Needed | Trade Size of Chains | Fastenings to Walls† |
|---|---|---|---|
| 0 to 75 | 1 | 4 | Two expansion bolts |
| 75 to 150 | 2 | 4 | Two expansion bolts per chain in different places |
| 150 to 300 | 2 | 8 | One bolt through wall, or equivalent |
| 300 to 450 | 2 | 10 | Two bolts through wall or equivalent |

* Where expansion bolts are arranged so that supports or guys make an angle of about 60 deg. with sign, or where they are attached to strong ledges, side walls, posts or columns so as to avoid outward pull, or where machine or lag screws enter strong timber or iron frames, or where chains pass onto roofs to strong structures or anchorage; these methods of supporting will be considered as equivalent to bolt through wall; but each such case is dependent upon approval of the inspection bureau.

† No support or guy to spread less than 30 deg. nor to be attached back of center of gravity.

TABLE II—CHAIN GUYS FOR EACH SIDE OF SIGN*

(Upper figure is the size and lower figure the required number of guys)

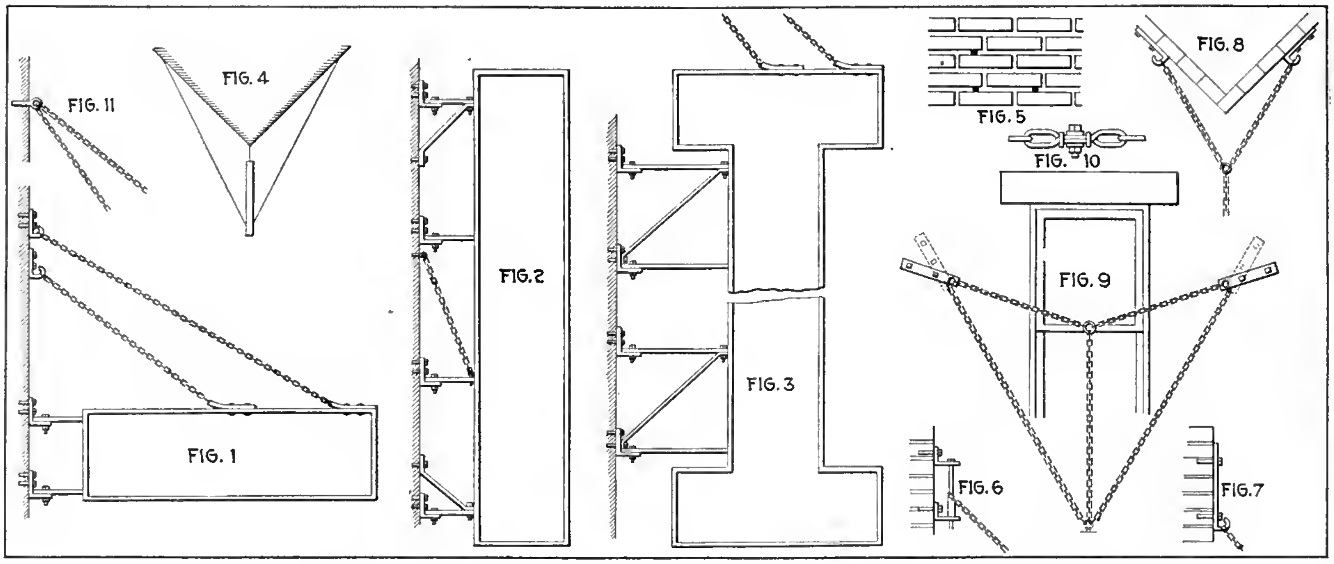
| Height, Ft. | Length of Sign (Horizontal), Feet† 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | Height, Ft. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 1 |
| 2 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>4 | 4<br>4 | 2 |
| 3 | 4 | 4 | 4 | 4 | 4 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>4 | 4<br>4 | 4<br>4 | 4<br>4 | 4<br>4 | 4<br>4 | 3 |
| 4 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | .. | 4<br>2 | 4<br>4 | 4<br>4 | 4<br>4 | 4<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 4 |
| 5 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | .. | .. | .. | 4<br>4 | 4<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 5 |
| 6 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 8<br>2 | 8<br>2 | .. | .. | .. | .. | .. | 8<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 8<br>4 | 6 |
| 7 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 8<br>2 | 8<br>2 | .. | .. | .. | .. | .. | .. | .. | 8<br>4 | 8<br>4 | 8<br>4 | 7 |
| 8 | 4<br>2 | 4<br>2 | 4<br>2 | 4<br>2 | 8<br>2 | 8<br>2 | .. | .. | .. | .. | .. | .. | .. | .. | .. | 8<br>4 | 8 |
| 9 | 4<br>2 | 4<br>2 | 4<br>2 | 8<br>2 | 8<br>2 | 8<br>2 | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. |
| 10 | 4<br>2 | 4<br>2 | 4<br>2 | 8<br>2 | 8<br>2 | 8<br>2 | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. |

*For larger signs provide No. 8.0 guy for each 30 sq.ft.
†Chain trade numbers require a 0 to be added, as 1.0, 2.0.

It is advisable to use chains for supports rather than cables because of the greater liability of the latter to rust. In the tables only two sizes of chain, Nos. 4.0 and 8.0, are considered. This is done for the purpose of simplification in the interest of sign hangers as well as inspectors. The tensile strength of welded chains is usually taken as 60 per cent of the tensile strength of the material out of which they are made.

The side guys given in Table II are calculated for a minimum safety factor of two and one-third. There are several reasons for this comparatively low figure. One is that the wind pressure taken at 20 lb. per square foot is about four times as great as the weight of the sign per square foot, and if side guys were selected with the same precautions as are taken for the supports, they would look extremely heavy and be apt to expose the inspection bureau to ridicule. Furthermore, this wind may last only a few minutes. Another reason is that should the guys give way the sign will not fall to the walk if properly supported, or at least not without pedestrians receiving warning.

All of the above calculations have been based upon angles of 30 deg. because this angle is often the most advantageous, and at corner signs it is about the greatest obtainable.



FIGS. 1 TO 11—VARIOUS METHODS OF SIGN SUSPENSION ACCORDING TO POSITION OF INSTALLATION. FIG. 9 SHOWS THE METHOD OF HANGING A SIGN BEFORE WINDOWS

The number of square feet allowable per rigid brace of given diameter and length is given in Tables III and IV and has been calculated from the following formula:

Square feet of sign surface =

$$[15{,}000 - (L/R)]A \div 44.$$

$L$ is the length of the brace, $R$ its radius of gyration, $A$ its area in metal, 44 the stress per square foot which a wind pressure of 20 lb. (9.07 kg.) per square foot exerts upon a brace arranged at an agle of 30 deg. The radii of gyration for pipes are found by the formula

$$R = (\sqrt{D^2 + d^2}) \div 4,$$

$D$ being outside and $d$ inside diameter of pipe.

The stresses are calculated according to

$$W(\sqrt{L^2 + H^2}) \div H.$$

Here $W$ stands for total weight of sign or total wind pressure, $L$ for distance from point of sign attachment to building line, $H$ for height of attachment above sign. The radii of gyration for angle irons are taken from tables.

In general, long horizontal signs may be looked upon as depending mainly upon the chains for supports, while the long vertical signs are held mostly by their rear supports. If the rear supports are well braced, as shown in the figures, the guys will need only to keep the signs from falling out. The rear supports are therefore subject merely to a shearing strain.

Fig. 5 shows the usual method of using expansion bolts with reference to joints in brick or tile walls. Whether it is best to place these bolts in the joints or in the bricks themselves is an open question. In some cases the back of the brick is broken out in the process of drilling; in others the brick is loosened from its bed of mortar. If placed as shown in the sketch, chances of accident are reduced to a minimum. Thousands of bolts have been fastened in this manner, and so far as can be recalled none of them have given way sufficiently to let a sign fall. In some cases, however, they have been known to split thin-veneer stone into which they were fastened. Wooden plugs have also been driven into holes drilled into the brick walls and spikes then driven into the wood, but these pull out quite often.

Methods of attaching chains to walls by means of expansion bolts are shown in Figs. 6 and 7. It is always best to hang the chain near the bottom of the bolt, because when so attached should the lower bolt give way the fault will show at once, while the upper one may still carry the entire load. If the stress is thrown too much upon the upper one, it will be the first to give way, thus allowing the lower iron to be broken off.

Attaching signs to corners of buildings is shown in Fig. 8. There is very little outward pull on expansion bolts so arranged, and this method may be taken as equivalent to a bolt through the wall. The two methods shown in Fig. 9 are often used where it is necessary to place a sign directly under a window or other obstruction, but spreading chains meeting at the sign are not looked upon with much favor. The signs that have fallen in Chicago have been knocked loose by objects falling upon them or their supporting chains. Such chains offer a double chance for accidents of this nature. Nor is such an arrangement to be recommended for guying. In a storm the wind pressure on an average sign will be about four times as great as the weight and will therefore tend to lift a sign provided with such chains. The method shown in

TABLE III—CAPACITY IN SQUARE FEET OF SIGN SURFACE FOR PIPE BRACES

| Diameter of Pipe | Outside Diameter Pipe | Length of Brace. (Not More than 40 Sq. Ft. on One Brace) 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 18 | 20 | 22 |

TABLE IV—CAPACITY IN SQUARE FEET OF SIGN SURFACE FOR ANGLE IRONS

| Dimension of Angle Iron, In. | Length of Brace. (Not More than 40 Sq. Ft. on One Brace) 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 x 1 x ⅛ | 12 | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. |
| 1¼ x 1¼ x ⅛ | 37 | 20 | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. |
| 1½ x 1½ x ⅛ | 57 | 41 | 25 | 8 | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. |
| 1¾ x 1¾ x ⅛ | .. | .. | 61 | 28 | 12 | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. |
| 2 x 2 x ⅛ | .. | .. | .. | 49 | 32 | 16 | .. | .. | .. | .. | .. | .. | .. | .. | .. |
| 2½ x 2½ x ¼ | .. | .. | .. | .. | .. | 58 | 41 | 25 | .. | .. | .. | .. | .. | .. | .. |
| 3 x 3 x ¼ | .. | .. | .. | .. | .. | .. | .. | .. | 92 | 56 | 24 | .. | .. | .. | .. |
| 3½ x 3½ x ¼ | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | 77 | 42 | 9 | .. |
| 4 x 4 x ¼ | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | .. | 59 |

the center of the figure is preferable, but in some cases the spreading chains seem to offer the only solution.

Some extracts from the Chicago rules are given below. They are arranged so that the important points can be easily checked by sign hangers and inspectors:

*Construction and Erection.*—All signs must be of metal and arranged to swing. No sign over 6 ft. long shall exceed half its length in height, nor be less than 9 ft. above walk, nor its rear end more than 2 ft. from building, nor project beyond curb line, nor obstruct fire escapes, nor be attached to them. All metal must be galvanized or protected in an equivalent manner, and the maker's name as well as dimensions and weight of sign must be marked upon it.

*Supports and Guys.*—Supports and guys must be provided and attached in accordance with Tables I to IV.

*Special Approval.*—Signs weighing more than 450 lb., or having a surface of over 75 sq.ft., or held by diverging supports, guys or supports arranged at angles of less than 30 deg. must be especially approved in construction as well as hanging.

*Special Rules and Fittings.*—Signs must not be fastened to window sills or frames. Expansion bolts, split links, turnbuckles, machine or lag screws and bolts used to splice chains must not be less than ½ in. in diameter. Turnbuckles must be provided to distribute strains and keep chains taut. Chains must not cause side strain on links. Pipe braces must not have joints near center and must be closed at ends by welding or approved fittings.

# Basis of Success in Customer Ownership

### A New Service by the Public Utility Affording Opportunity for Investment and for Savings—Plain Dealing and Truth Essential in Putting This Opportunity Before the Public—Good Name the Vital Factor

By WARREN R. VOORHIS
*Vice-President American Water Works & Electric Company, New York*

THE work done by the public utilities of this country is an invaluable contribution to the happiness, the comfort and the welfare of all the people. This service of light, heat, water, communication and transportation is so constant, so universal and so essential that the average man accepts it much as he does the forces of nature, without giving thought to the financial and economic problems of the agencies which furnish it for him.

But at the present time, nearly everywhere, public utilities are offering to their patrons still another form of service, and if it is performed with wisdom and intelligence, it cannot fail to change the public attitude toward utilities from one of indifference to an attitude of useful interest and co-operation. In many cities of the country, the local utility company is offering to its patrons an opportunity to become partners in the enterprise by the investment of savings in the securities of the company. The public response has been most remarkable; it constitutes an outstanding feature of modern utility financing. The office of the public utility has become something more than a place to which the consumer goes to pay his bill; he goes there to invest his savings. The postman brings him, besides his bill for service rendered, news of the business in which he is interested together with his dividend check.

The value to the utility of this changing relationship is so obvious that it needs no extended comment. A utility must grow and extend its service as its community increases in wealth and population. If it can finance its needs in some part by successfully inviting to partnership the savings of its patrons, its situation is most fortunate. The resulting friendly co-operative spirit is hardly less valuable.

This article deals with this relationship from the viewpoint of the consumer. The prosperity of this or any other nation depends largely upon the disposition and ability of its average citizen to save steadily and invest his savings with wisdom. Perhaps no one thing contributes more to human happiness than does the gradual accumulation of some fund, however modest, as a protection against the hazard of sickness and the certainty of old age. Innumerable speeches, sermons, essays and warnings have been issued on this subject, and not too much has been said. But the most effective way to induce saving is the offer of a sound and accessible opportunity. This is the new service of the public utility to the public.

### PROTECTION TO SAVINGS

The offer is made to the class of people who most need the opportunity. The hundreds of millions of dollars which have been so invested in the past few years are made up of innumerable contributions from people of modest means, many of whom never before saved anything or made any form of investment. In a recent offer of preferred stock made by a water company with which I am familiar more than $1,200,000 was taken, and the average subscription was less than $400. About 50 per cent of the whole was taken by people who paid at the rate of $5 per month upon each hundred-dollar share.

If people need be taught the habit of saving, no less do they need the opportunity to invest with wisdom. Nothing is more pathetic than the story of men and women who have saved during years of rigorous self-denial, only to have the accumulation swept away in some visionary or dishonest scheme which lacks every characteristic of a sound investment. A preventive against such a calamity, better than all warnings, prosecutions and prison sentences for the perpetrators of such frauds is the presence of an opportunity for safe investment placed at the very door of the man who has saved a little money and who wants to put it to work.

This is the service which the public utilities of this country have an opportunity to offer to their patrons and consumers. It is hardly second in importance to the primary service which they render.

Every consideration, moral or legal, and the plainest dictates of enlightened self-interest demand that this service be offered and given with as much wisdom, intelligence and consideration for the welfare of the consumer as is employed in giving the primary physical service to him.

The opportunity to invest savings will be taken in the main by people who are industrious and intelligent but who have had little or no experience in the judging of investments. Most of them never before invested a dollar in any form of security. They do not grasp the significance of a balance sheet at a glance. The responsibility of the officers of a public utility who put out these securities is, therefore, very great indeed.

It is a wise regulation in many states that all such securities issued shall be first approved by public authority; but, of course, this does not absolve the officers of the utility from responsibility. The officers, the operators and the consumers of a public utility constitute a mutually dependent group of people. There can be no harmony unless there is complete fairness and honesty in the relationship, and certainly this must be true in the matter of investment.

The utility which has a satisfied body of patrons as a partner is happily situated. A public utility which puts out more preferred stock than the equity in the property will bear, or which promises more dividends than the earnings will justify, is laying up untold trouble for itself in the years to come. I would not care to be the operator of a public utility which passes its dividends upon the securities which it has distributed to its patrons. The future public response to all these public utility offerings will depend much upon the amount of prudence and wisdom employed by the utilities in their creation.

### Plain Dealing and Truth Required

The utility which expects to offer its securities to its patrons with any success must speak and write about the offer in a language which they can understand. The average utility patron does not understand the technical terms of a modern bond circular. The number of people who do is even less than the number of people who pretend to understand a modern bond circular. A majority of the subscribers will not know the difference between bonds and stock. They will not distinguish between assets and liabilities, as set out in the balance sheet. "Depreciation," "maintenance," "fixed charges," "reproduction cost," "ratio of earnings to interest and dividends"—all these terms have not yet been passed into the vocabulary of the ordinary household.

But the story of a public utility offering is really a simple one, for public utility financing is in its essentials one of the simplest forms of financing. I should be one of the foremost living authorities on the subject of publicity for public utility preferred stock offerings. I have tried letters, circulars, slogans, billboards, street cars, motion picture slides, postcards, newspapers and the word of mouth of salesmen, some of them high-class and some who could not come in out of the rain without help.

But I am not a foremost living authority. I only know that the truth must be told, and should be told in the simplest possible way and in the fewest number of words which will contain the story.

There is a plain and simple way to tell nearly everything. Only the very young expert physician upon the witness stand uses heavy language that confuses the jury; the old doctor says the same thing in the language of the plowed field.

The nature and extent of the property, the future requirements of the business, the use to be made of the new money, the amount of earnings left after operating expenses, out of which dividends can be paid, the public regulation and approval which should assure continued protection to consumer and investor, the past record of performance—these facts, expressed in the language of the shop and farm, are bound to be interesting and effective.

### Good Name the Vital Factor

When a man goes to a bank to borrow money, the bank investigates the security offered and then he considers that which he calls the "moral risk." By that term he means the general character and repute of the man in the community where he lives. If this "moral risk" is very good, I think the banker will look to that almost as much as to the paper security which is offered.

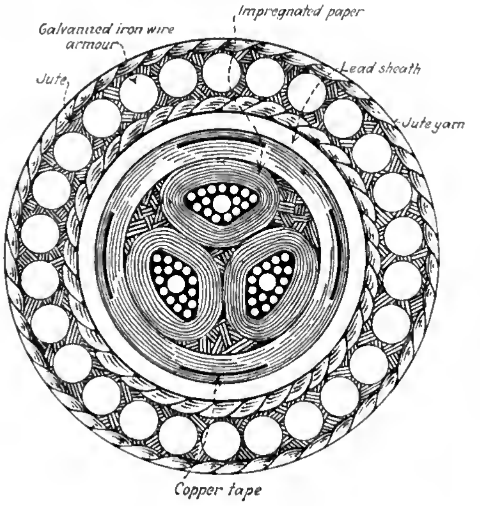
The public utility which offers its securities to its consumers will find that they will weigh the moral risk. It will weigh with them as much as any other factor. A patron who cannot analyze the balance sheet of a utility knows very well indeed the reputation which it has in the town for honesty and fair dealing. If a public utility decides to offer its securities to its own consumers, it will find that its record of long years of fair, courteous and honest operation will be more valuable than any publicity it can put out.

So it seems to me that the future success of what has come to be called "customer ownership" rests almost entirely with the public utilities themselves. That public utility which has pursued a uniform course of fair dealing with its patrons, which will accept full responsibility for the character of the security offered, keeping in mind the fiduciary relationship; which explains its needs and its problems to its consumers in a plain, straightforward way, will find itself in a partnership which will add very much to its value to the community.

It will have given a new and a valuable service to its consumers.

## Japan Now Claims Longest Submarine Power Cable in the World

THE submarine cable which has recently been laid and is now transmitting power from Niihama to Shisakajima, Shikoku, Japan, is asserted to be the longest of its kind in the world. The cable is about 13



CROSS-SECTION OF CABLE

miles long and consists of twenty-three factory lengths, each measuring 3,000 ft. The cable is composed of three sector-shaped conductors having a cross-sectional area of 100,000 circ.mils each. Each conductor is in-

sulated with impregnated paper, and the three conductors are wrapped with the same material and inclosed in a lead sheath. Around the sheath is a jute bedding wrapped with galvanized-iron-wire armor served with jute yarn. The cable contains four copper tapes within the outer belt insulation. These tapes serve as a protection for the power conductors and are also used for two telephone circuits. The finished cable is 3 in. in diameter and weighs 6.3 tons per 1,000 ft. It was tested at 30,000 volts at the factory, and at a pressure exceeding the working pressure (namely, 11,000 volts) by 50 per cent after the cable was laid. The cable was manufactured by the Sumitomo Electric Wire & Cable Works, Ltd. Laying of the cable was supervised by engineers of the same works and the installation was completed without any serious troubles.

# Inert Gas Over Oil in New Transformer

## Eliminates Oxidation of Oil and Serves as Cushion to Relieve Tank During Internal Explosions—Constitutes an Important Development in High-Voltage Apparatus

By L. H. HILL
*Transformer Engineering Department,*
*Westinghouse Electric & Manufacturing Company*

THE protection of insulating oil from deterioration and the elimination of the possibility of explosions in power transformers have been live problems for many years, and they have become more and more acute as larger and larger units are built.

The life of a mineral oil is intimately connected with the formation of deposits known as sludge. Oils obtained from the same shipment after having had similar refining treatment may when they are used in transformers be found to differ much in their sludging characteristics. Some oils go bad after a year or two, while others with proper care function well after as much as twenty years of service. The latter record is exceptional, however, because it involved a transformer which was never permitted to work at any overload, and because the oil was kept cool continuously. Moreover, it was a highly refined product. Other oils, though possessing many excellent physical and chemical properties, are fast sludge formers. Many chemist-years have been spent trying to ascertain the nature and mechanism of sludge formation, yet up to date, in spite of the many tests devised, no suitable quick quantitative method has been forthcoming which would indicate a true index of sludge formation.

Kissling's[1] oxidation method has been ordinarily used for testing transformer oils. Oil is kept at 150 deg. C. for fifty hours while oxygen is slowly passed through it. At times a piece of copper gauze is placed at the inlet of the air to act as a catalyst. The official French transformer oil specifications[2] call for a modification in the method by heating the oil from five hours to five days. Only naturally occurring catalysts are present, none being introduced. After the oil has been treated with oxygen or air, it is extracted with alcoholic soda and the sludge precipitated with light naphtha. The results are interpreted as "tar-forming," "coke-forming," "resinification constants" or "sludging" numbers.

The Waters[3] carbonization test depends upon the oxidation of the oil in the air at 250 deg. C. for two hours and thirty minutes. After cooling under prescribed conditions, petroleum ether is used to dissolve the thickened oil. The next day the precipitate is filtered and the dried weight calculated to represent the "carbonization value."

[2]Union des Syndicates de l'Electricité, Paris.
[3]Circular Bureau of Standards No. 99, 1920.

The Nastjukoff[4] formalite reaction modified by Westinghouse is used as an index to the sludging value of transformer oils. The insoluble condensation products from the treatment of oil with concentrated sulphuric acid and formaldehyde are collected on a Gooch filter, washed with petroleum ether, dried and weighed.

Herr's[5] methylal sulphuric acid condensation, the Etard's[6] oxidation of petroleum hydrocarbons, the Rohland[7] clay adsorption of unsaturates, the Michies[8] sludge test, the sulphur dioxide method[9], the selenium oxychloride test[10], the Babcock[11] absorption test, the acid heat test[12], the iodine and Maumene[12] number, are attempts to measure the possible oxidizibility or, rather, the durability of an oil.

### Temperature Influences Carbonization

In all the carbonization, gumming, sludging or oxidation tests the temperature control and the impurities present or added have a decided influence on the amount of precipitate formed. But it is a most significant fact that transformer-oil sludging phenomena are intimately tied up with the presence of oxygen. To demonstrate readily the effect of sludging in air and non-sludging in the absence of air, it is only necessary to heat the oil in an open and in a closed tube to a temperature where sludge formation is greatly accelerated. A great many tests of this kind at varying temperatures up to 200 deg. C. show that sludge formation is greatly hastened by a rise in temperature in the presence of air. Many catalysts have been tried out in connection with the sludging phenomena over the same temperature range.

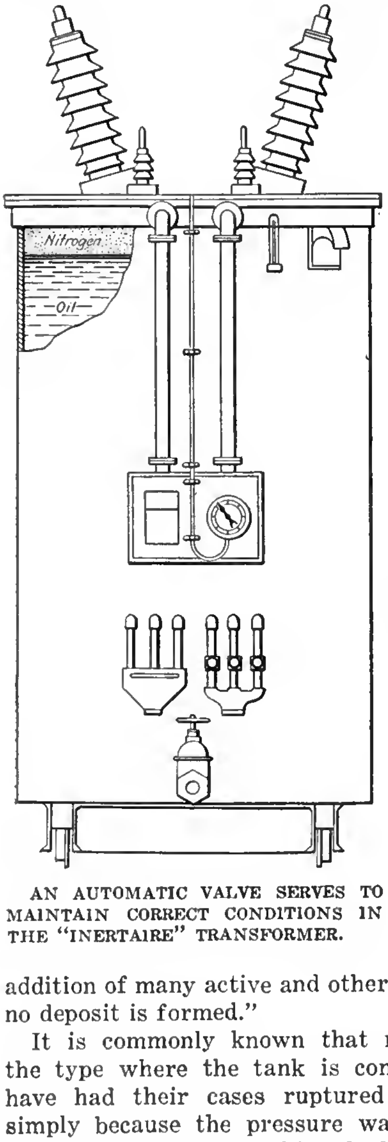
[12]*Journal of Industrial Engineering Chemistry,* 3, 815 (1911).

The products in both the natural and catalytic oxidation are the same[13].

It is common experience in transformer practice to have to filter the oil on account of its deterioration due to oxidation; in fact that is one of the main reasons given for the use of the conservator type of transformer, that is, to lessen the deterioration of the oil through reducing its contact with the air. Data have been obtained from elaborate tests in the Research Department of the Westinghouse Company which show the rate of oxidation of transformer oil with air and with oxygen and the absence of oxidation with nitrogen over the oil. For example, quoting from an experiment made by C. J. Rodman:

"Heating the oil at 200 deg. C. for fifteen days in an open tube (⅝ in. in diameter by 8 in. long) in contact with air a dense deposit was formed within the oil, which when washed with petroleum ether on a filter and dried showed 12.3 per cent sludge. A similar experiment was made, except that the oil was heated in the presence of an inert gas—nitrogen. In this case no deposit was formed and the oil remained the same natural clear color. The same comparison is obtained at lower temperatures but lengthening the time of heating. When heating a good transformer oil in the absence of oxygen or air, even with the addition of many active and otherwise harmful catalysts, no deposit is formed."



AN AUTOMATIC VALVE SERVES TO MAINTAIN CORRECT CONDITIONS IN THE "INERTAIRE" TRANSFORMER.

It is commonly known that many transformers of the type where the tank is completely filled with oil have had their cases ruptured by internal pressure simply because the pressure was transmitted directly to the case, and something had to go. On the other hand there are records of many other cases of trouble in which an air space existed above the oil level where the internal pressure has bursted a relief diaphragm without rupturing the tank at all. In these cases the air has served as a cushion to take the edge off of the very sudden increase of pressure.

The "Inertaire" transformer, utilizing a cushion of inert gas above the oil level, was developed as a solution of the foregoing problems. With this system deoxygenating and dehydrating means are provided for removing oxygen and moisture from the air in the casing, leaving a dry, inert gas, nitrogen.

This type of transformer requires bushings similar to those that have always been used in transformers having an air space above the oil level and such transformers are used for the highest operating voltage. The bushings for the conservator type of transformer can be a little shorter on their inner ends, owing to their entire immersion in oil, but this is a matter of no practical importance and is certainly no practical objection to the use of inert gas.

A sketch illustrating the "Inertaire" transformer construction is indicated herewith. The cabinet shown on the side of the tank contains the special compound used as a deoxygenating material, a dehydrator and a new type of valve, employing neither springs, counterweights or sliding members, which relieves gas from the tank at say 3 lb. to 5 lb. pressure and admits air at a relatively low vacuum, a pound or less.

### Functioning of Apparatus

The apparatus functions as follows:

When the oil in the case increased in volume owing to an increase in its temperature, the pressure of the gas above the oil level tends to increase. If the load curve is such that the pressure is reached at which the valve in the cabinet releases to atmosphere, the excess gas escapes. This release of gas to the atmosphere obviously has no effect on the oxygen or moisture content of the gas in the space above the oil.

When, on the other hand, the temperature of the oil decreases, the reverse action takes place. If the load curve should be such that the oil cools sufficiently to bring the pressure to a value slightly below atmosphere, the valve again opens, this time admitting air to the cabinet. As this air is drawn through the cabinet, it passes through the dehydrator and porous deoxygenating compound contained in the lower part of the box, where moisture and oxygen in it are removed. This practically pure and dry nitrogen is then drawn through the pipes shown on the side of the tank into the gas body above the oil level.

It is obvious, of course, that the cycle thus described takes place intermittently, the frequency depending largely on the load curve. Power transformers operating at full load for days at a time will pass through comparatively few of such operations. In any case it will be noted that the exhausting of gas from the cushion and the inhaling of pure dry nitrogen is in itself a method of removing oxygen and moisture from the gas above the oil.

When the transformer is first put into service the gas cushion may be made inert either by diffusion to the deoxygenator or by starting with the tank filled with oil and drawing the air in through the deoxygenating material as the oil is pumped out to the proper level.

With the gas space once deprived of its oxygen the rest is automatic. If the pressure drops below atmospheric, the valve opens and allows the air to be drawn through the deoxygenating and dehydrating means into the tank as pure dry nitrogen.

The function of this valve is seen to be threefold: (1) To reduce the amount of air interchange between atmosphere and tank by allowing the pressure to build up to a safe value before releasing; (2) to eliminate the entrance of air into the tank through possible leaks by providing at the proper time a low resistance path; (3) to isolate at all other times the inert gas body from the atmosphere.

The dehydrator used with this construction is of a new type which does not possess the undesirable characteristics of the familiar calcium-chloride breather, whi

[13] *Berichte*, 53B, 66-71 (1920).

simply absorbs the moisture from the air and which, if not properly attended to, may actually be a hydrator rather than a dehydrator.

The advantages of a transformer casing provided with a gas cushion of nitrogen are many. In the first place, the insulating oil is maintained at all times dry and free from contact with oxygen. Extensive experiments have shown that transformer oil in a nitrogen atmosphere when subjected to the most harsh treatment does not deteriorate or even change color. The same oil when given the same treatment in an atmosphere of air sludges badly and otherwise deteriorates. Transformer oil absorbs approximately 10 to 15 per cent of air by volume at normal temperatures, but after heating to operating temperatures most of this is driven off in the "Inertaire" transformer and is gradually replaced by nitrogen in approximately the same proportion. Since oxygen absorbed in the oil is necessarily in contact with it, it contributes considerably to the sludging or oxidation phenomenon; hence its replacement by an inert gas is an excellent step toward the preservation of the oil.

Another important feature is that the casing is not completely filled with oil as in the overflow or expansion-tank type of construction. This construction was developed in order to eliminate some of the disadvantages of the plain, ordinary tank first used with a cushion of air above the oil. It involves the use of an auxiliary tank elevated above the main tank and connected thereto by means of a small pipe. The design is such that with the oil at its lowest temperature the main tank and the lower portion of the expansion tank contain oil. The auxiliary tank is of such size that the expansion of the oil in the main tank is not sufficient to overflow the auxiliary structure.

While this construction has advantages over the simple tank with air over the oil, it also has disadvantages. Perhaps the greatest of these is the fact that the main tank is completely filled with oil. Under certain conditions, owing either to the fault of the transformer itself or to the switching apparatus controlling it, arcing under the oil level may take place. When this happens large quantities of gas are evolved, due to the breaking down of the oil. In effect, this rapid gas evolution may simulate an explosion with a steep wave front below the oil level. With a tank completely filled with oil there is no compressible medium in the casing to take the shock of this wave, and the result is that the weakest part of the structure must fail. Attempts have been made to remove this hazard by mounting on the cover an elbow with a weak diaphragm on one end. To prevent the spilling of oil when this diaphragm ruptures it is necessary that the elbow be elevated above the cover to a point above the maximum oil level in the overflow tank. This means that there is a pocket of oil of comparatively small cross-section between the cover of the tank and the diaphragm which is supposed to rupture in case of internal distress. The fact that a small gas cushion is also present between this plug of oil and the diaphragm makes it still further uncertain that the device will operate.

It is generally recognized that with this expansion tank type of construction it is entirely possible that a failure of the transformer may cause manholes to be blown off, with a stream of oil following them, or cover belts to be stretched, allowing oil to run out of the auxiliary tank into the station.

It is an important function of the gas-cushioned transformer casing to eliminate even the possibility of this sort of disaster. A cushion of compressible gas is always present above the oil level; hence the first shock of a pressure wave may be absorbed, allowing a relief diaphragm time to act and expel the gas evolved. This action combined with a new type of diaphragm structure which eliminates gas pockets between the diaphragm and the cover of the tank protects the apparatus from danger due to a failure under the oil level.

The insulating oil in the overflow tank construction is in contact with the atmosphere, and some contamination is therefore possible. In addition, the very nature of the construction, with the expansion tank elevated above the main tank, means trouble due to the head of oil causing seepage leaks through gaskets around the cover and bushings. When it is necessary to open the main tank for inspection purposes or otherwise, it is necessary to drain the oil from the conservator and part of the main tank to a point below the cover. This in many cases presents a problem as to the disposition of this oil while the tank is open.

The advantages of the inert gas-cushioned structure over the simple type with the air space over the oil are self-evident. With this structure there is always the possibility of the ignition of a mixture of air and hydrogen or volatile hydrocarbons evolved in case of arcing under the oil level, and the contamination of the oil by moisture or oxidation.

With the modern tendency toward larger and higher voltage units and with the insistent demands for absolutely reliable service, the general adoption of the inert gas-cushioned transformer casing bids fair to be one of the most important developments in high-voltage power apparatus. Acknowledgment is made to C. J. Rodman for the material on sludge formation.

## Forest Protection Benefits Stream Flow

THE value of the assured protection of the forest cover in relation to the development of water power is, says the report of the National Forest Reservation Commission for the last fiscal year, apparently fully realized in hydro-electric developments which are now being made on streams the upper basins of which are within the purchase units within which lands are being acquired for Eastern national forests. On the Tallulah and Chattooga Rivers, the headwaters of which are largely protected by the Savannah purchase unit, there have already been installed four units.

With three additional power units, the total generating capacity will be increased to 175,000 kw. and the total storage capacity will be nearly 9,000,000,000 cu.ft. This storage will be so augmented upon the completion of the entire eleven power units that it is expected that more than 95 per cent of the discharge of these two streams, the largest headwaters of the Savannah River, will be controlled.

A similar development is now in progress on the Little Tennessee River, which is one of the important head streams of the Tennessee. The waters of the Little Tennessee River are protected by the Nantahala unit and a portion of the Savannah purchase unit. By a series of reservoirs it is designed to control more than 90 per cent of the discharge. The initial unit, for power generation only, consisting of a dam about 200 ft. high, has been constructed, developing more than 90,000 hp. The presence of the protection of forest cover to the basins on which the storage reservoirs are located is stressed, since this assures low turbidity, slight silting and permanency in storage.

## Letters from Our Readers

A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute

### A "Yardstick" for Grading Public Utilities

*To the Editors of the* ELECTRICAL WORLD:

Allow me to indorse the view expressed in an editorial printed in the ELECTRICAL WORLD for Feb. 17 that there is a "yardstick" needed with which to grade utilities. In my experience as a valuation engineer, using original cost, reproduction new, tax values, etc., and studying operating conditions also, I have been impressed with the fact that wide gaps exist between the various measuring units so far devised and that they ought somehow to be brought nearer together. I should like to suggest as one form of "yardstick" a method that has often brought out the real point in a general problem for me. I know that it is used by many utility men, but I also know from experience that there are a great many who have never used it or do not understand its significance.

We must admit that the utility game is a business, very much restricted in some ways, but still a business, and as such it must be conducted for profit. To my mind, however, it is no more restricted than any other business which operates as a monopoly for the greatest net profit and is in a measure governed by the same laws. Whatever is left after the expenses are paid goes toward reserves for depreciation, taxes, return on investment and profit. With this in mind, let me submit my "yardstick." It is this:

Let $V$ = commercial value of the business,
$R$ = operating ratio in per cent,
$F$ = fixed charges in per cent,
$G$ = gross revenue per year.

Then $V = G(100 - R)/F$.

Taking an example, suppose that after taxes are paid a utility's operating ratio is 64 per cent, and that its fixed charges are then depreciation, 4 per cent, and interest, which can be assumed to be 8 per cent, or that the total fixed charges are 12 per cent in this case and gross revenue \$100,000 per year. Our equation then becomes:

$$V = \$100,000 \times (100 - 64) \div 12 = \$100,000 \times 3 = \$300,000.$$

Here, then, is our measure of this utility. Suppose we look at the books of the concern and find that this utility has \$500,000 plant assets. Now we may go to work to answer the question involved.

Let us make some more assumptions. Possibly this utility's expenses should be reduced; maybe it needs a rate increase to increase revenues. Either one of these measures will improve the operating ratio. Maybe service is poor and revenues are low for that reason. Maybe there has been too much high-priced construction, perhaps some foolish construction. Possibly the business is still undeveloped and it may be necessary to make rate changes before development can be attempted. I might add here that rate changes do not always mean rate reductions. Some of my readers might be surprised if they, for instance, converted oil-engine costs into an equivalent demand and energy charge, and I believe too much attention has been given heretofore to cutting costs and insufficient attention paid to what our competitors really can do.

Possibly fixed charges were estimated too high. Suppose we choose 4 per cent depreciation and 6 per cent interest, or 10 per cent total. Then:

$$V = \$100,000 \times (100 - 64) \div 10 = \$360,000.$$

I do this to show that it is very important to make the proper assumptions as to the so-called fixed conditions which hold with any particular property. Investigation might disclose that business could be increased 10 per cent and operating expenses cut 10 per cent and that 10 per cent was the right fixed charge. Then:

$$V = \$100,000 \times (100 - 53) \div 10 = \$470,000.$$

This now almost balances our assumed book value and shows a nearly healthy financial and operating condition. There is a temptation here to juggle the values in this equation until it fits the case. This, however, destroys its value as a guide.

I have discussed this subject merely to bring home again to some, and possibly for the first time to others, the importance of this "blanket yardstick," which really covers the whole field of operations of any particular utility, or, in fact, any business which keeps a proper accounting record.

### American Success in China

*To the Editors of the* ELECTRICAL WORLD:

We desire to correct a wrong impression given by an article published in the ELECTRICAL WORLD of Sept. 2, 1922, entitled "Outlook in China." A statement was made as follows: "Contracts for complete systems are generally awarded to some European firm in Shanghai, Hongkong or some other large city."

Our agents in China, Andersen, Meyer & Company, Ltd., have asked me to call your attention to certain facts which show that it is far from the truth that European firms generally get the contract for electric lighting plants in China. I quote from Andersen, Meyer & Company's letter certain facts showing what the representatives of an American firm have accomplished in China:

"We claim as an American organization that we have installed more power plants and with larger output than any other contracting house in China and have followed out very much the same procedure as the ELECTRICAL WORLD asserts to have been followed by European competitors. As instance of this we have during 1922 contracted for the complete installation of the only four large power-plant extensions awarded in China.

"We would mention for your information a number of power plants which have been fully equipped by Andersen, Meyer & Company, as follows: Mukden, Kwangtung, Kirin, Harbin, Tientsin (several large cotton-mill power plants, average rating 2,000 kw. to 3,000 kw.), Hankow, Hangchow, Foochow, Amoy, Canton, Shanghai Chinese native city, etc.

"In addition to the above, we have supplied power plants in small sizes to most of the inland cities of China and have supplied similar plants to more than twenty-five cotton mills, principally in Shanghai and the northern territory, including Tientsin and Manchuria. We have secured not only more contracts in Manchuria than has any other firm, but a larger volume of business than any corporation trading in the Orient. We have at present in course of construction or installation one 40,000-spindle cotton mill complete with power-plant equipment, a large extension to the Mukden government electric light works, an extension to Kirin Electric Company and a new plant for Tung Liap Chen.

"As a matter of fact, if we eliminate the power plant

of the Shanghai Municipal Council, in which the General Electric Company has generating equipment of over 50,000 kw. in a total of 100,000 kw., there are few, if any, power plants in China which have been equipped with European plants." L. M. NICHOLS,

Director Commercial Research.
International General Electric Company,
New York, N. Y.

[The article referred to was written jointly by R. A. Lundquist of the United States Bureau of Foreign and Domestic Commerce and P. S. Smith, associate editor of *Ingeniería Internacional.* Mr. Lundquist says: "In all Oriental countries there are two classes of people—the Oriental and the European—classification being by race and not nationality. The term 'European' in export parlance would therefore embrace the 'American.' Moreover, Andersen, Meyer & Company, although agents for American electrical products, are a Danish firm. The statement as it appeared in the article, therefore, should not be considered a reflection upon American activity or progress in the Orient."—EDITORS.]

## A Practicable Neon Night Lamp

*To the Editors of the* ELECTRICAL WORLD:

Apropos of the little neon sign lamps described in the columns of the ELECTRICAL WORLD not many weeks ago, I was fortunate enough to receive from one of my friends a neon night lamp of the type noted as in some little use in England within the last year. The interesting feature of the specimen I have before me is that it is an alternating-current lamp for use on 110-volt circuits, which makes it therefore practicable for household use. It is in a short bulb, about 55 mm. in diameter, and fitted with the ordinary Edison base; manufacturer, Philips. Within the exhausted bulb two thick wires come out of the seal, each a full millimeter in diameter. The two are coiled in a parallel helix with about 2 mm. between the turns. The length of the helix is about 25 mm. and its diameter slightly less, containing five turns of each electrode. It is stiff enough to hold its position, and the two free ends are turned down into the center of the helix, where they terminate in two tiny opposed plates about 3 mm. x 1.5 mm. in size and approximately 3 mm. apart. The wire in the stem below the seal forms a compact spiral. The convolutions of the helix with the terminal plates form a little distributed condenser, between the turns of which the characteristic neon glow appears when the lamp is put in circuit. It starts showing a distinct glow at a little over 80 volts. The color is chiefly orange red with the little purple tinge given by a relatively small blue component of the spectrum.

The total amount of light is roughly about ⅓ cp., ample for seeing a watch face or finding the way about a room otherwise dark. At approximately the voltage designed the lamp takes nearly 25 milliamperes, or, the power factor being somewhat over 90, a shade less than 2½ watts. The efficiency is low both intrinsically and on account of the unfavorable color of the light, but the little lamp does give for the most trivial amount of energy enough light to serve its purpose. Dipped yellow to cut out the blue component, it would make a very useful dark-room light, and it certainly is interesting to find an operative neon lamp on this scale.

So far as I am aware, the lamps are not now being made in this country, but they are very likely to make their appearance one of these days and to find a certain amount of use. The energy taken by the sample I have is too small to start a meter unless it is just on the point of creeping, but it is also so small that it may well be cheerfully forgotten, as in the case of a bell-ringing transformer, particularly as there is a distinct advertising value in the little night lamp that unquestionably would tend to increase paying consumption. At all events, it is one of the neatest little applications of the low-resistance characteristics of neon that one could wish to see. Probably the sign lamp will come into more extensive use than the smaller one, but the value of the latter as an occasional convenience is well worth consideration. LOUIS BELL.

Boston, Mass.

## Non-Porous Porcelain and How to Obtain It

*To the Editors of the* ELECTRICAL WORLD:

Anent the editorial in issue of the ELECTRICAL WORLD of Feb. 3 referring to a paper submitted at the Vancouver A.I.E.E. Convention by C. C. Farr and H. E. R. Phillpot on fuchsin dye tests to determine porosity of porcelain insulators, it would appear that much of an educational nature is yet to be done before the proper understanding of the porosity phase of porcelain is appreciated by the engineering fraternity in the light of modern progress in the ceramic art.

One important fact which seems to have been overlooked in every discussion listened to or published article read is that the porcelain tested by Messrs. Farr and Phillpot was made many years ago and is not in the least representative of modern American porcelain turned out by potteries manufacturing insulators for transmission and distribution of power in up-to-date plants and with modern equipment and properly developed technique.

Porosity in porcelain is caused solely by insufficient vitrification; that is, by not being fired at a temperature sufficiently high and for a sufficient period to close the tubes or pores inherent in clay products. There is probably no manufacturer of prominence today who does not fully understand this. If, then, insulators are still being sold which have even a slight tendency to porosity, the maker is guilty of culpable negligence or worse. Porous porcelain is inexcusable in the light of the present knowledge of ceramics.

Another point conspicuous by its absence in the discussion pro and con concerning fuchsin penetration is that if the test were to be utilized as a standard basis of acceptance of insulators, none obviously, could be used. The reason for this is, of course, that the tested insulators must be destroyed. If but a certain percentage of the total be tested, say 1 or 2 per cent, there is no assurance that the other 98 or 99 per cent are not porous. The testing of a sample may tell the porosity of that one insulator. Certainly it tells nothing about any other one of the hundreds or thousands involved. How, then, may sound conclusions be drawn from porosity tests so far as their application to commercial shipments of insulators is concerned? The only result is possibly to satisfy the investigator as to the probability of moisture absorption by the tested sample. Patently, the more sane method of obtaining non-porous porcelain is to deal only with makers of unquestioned reliability, responsibility and integrity. Porosity is a much-feared bugaboo which seems to hold a peculiar fascination for investigators, but which should not afford a moment's perturbation of mind to a purchaser in this day and age. Any buyer can easily and fully safeguard himself against porous insulators, and without exercising any unusual ingenuity in the accomplishment of this much-desired result. S. L. CASE,

Insulator Engineer.
Westinghouse Electric & Manufacturing Company,
San Francisco, Cal.

# Central Station and Industrial Practice

**Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants**

## Hydro Construction Work Directed by Radio

RADIO was used in the winter in the Sierra Nevada Mountains of Fresno County, Calif., to direct the activities of five hundred men who were in camp behind 30 miles of almost impassable snowdrifts to push forward the construction of a tunnel. This tunnel is part of the hydro-electric development project of the Southern California Edison Company, which is carrying on a program for the development of a million and a quarter horsepower derived from the San Joaquin River and Big Creek and other mountain streams.

The entire program called for approximately five thousand men, including the five hundred working on the upper end of the long tunnel over the crest of the Kaiser Range. The direction of the men was controlled by radio from the headquarters of the resident engineer at Cascada, the construction headquarters. The success of radio was so thoroughly demonstrated last winter, not only in directing the work of the men who were beyond wire communication, but in picking up and carrying on communication with the general offices of the company in Los Angeles, a distance of 270 miles, that facilities were greatly augmented in preparation for this winter's work and new apparatus was placed in service.

There are now three combined radio, telegraph and telephone stations in operation and one more radio station is being installed. The headquarters station at Cascada is at an elevation of 5,000 ft., in a canyon approximately 2,000 ft. deep, with abrupt walls on three sides. The second station is at the construction camp on the shore of Florence Lake, which is the southern portal of the Florence Lake tunnel, at an elevation of 7,000 ft., and about 7½ miles in a direct line northeast of Cascada. The third is at a construction entrance camp over the Kaiser Range, which is about 8 miles in a direct line north of the south portal of Huntington Lake. This station is only 300 ft. higher than the portal station, but there is a mountain pass about 2,000 ft. high between them. Tests carried on showed that to communicate a predetermined distance in this district it was necessary to use about twenty-five times more power than was needed near Los Angeles. The three transmitters being used are rated at ½ kw. and contain one tube. Each set was designed originally for continuous-wave telegraph, but they have been equipped for telephone or buzzer modulated telegraph.

THE USE OF RADIO BY THE SOUTHERN CALIFORNIA EDISON COMPANY HAS PROVED VERY SUCCESSFUL

To furnish power for the boring of tunnels a 30,000-volt transmission line has been built between Cascada and the two mountain camps. The radio sets give a rapid and reliable means of communication during transmission-line trouble and in handling switching and operating line orders. The transmitter at Cascada obtains its filament current from the 110-volt supply and its plate current from a 1,500-volt generator belt driven by a 2-hp. induction motor. The radio power plants at Huntington Lake and at the construction entrance camp each consist of a 220-volt, three-phase motor coupled to a 32-volt direct-current generator and belted to a 1,500-volt direct-current generator. Under normal operation the 32-volt direct-current generator furnishes power for the filament and the 1,500-volt direct-current generator supplies the plate. During a failure of the 30,000-volt transmission line the 32-volt generator operates as a motor from the storage batteries of the mine locomotives used in the tunnel work.

HOUSING FOR MOUNTAIN RADIO SETS

At radio receiving stations over the Kaiser Range in the Sierra Nevada Mountains orders are received from headquarters directing the work of five hundred marooned tunnel workers on the Southern California Edison Company's hydro-electric development project.

The antenna at Cascada is of the

inverted L type, 140 ft. high at the free end, 90 ft. at the station end and 120 ft. between spreaders. Five No. 8 copper wires spaced 4 ft. apart are used. At the Huntington Lake Camp a T aërial is installed, which is 140 ft. high and 175 ft. between spreaders. At the construction camp a T aërial 90 ft. high and 150 ft. between spreaders is used. The radiation from each of these antennas is about 2.4 amp. at 540 m., which is the normal operating wave length.

Los Angeles, Cal.

## Estimated Cost of 6,000-Kw. Outdoor Substation

THE Pittsfield (Mass.) Electric Company is building an outdoor switching and transforming station adjacent to its Silver Lake generating plant, in order to receive high-tension energy from the Turners Falls Power & Electric Company upon completion of an interconnection between the two systems. The ultimate capacity of the switching station will be 20,000 kw. The estimated cost of the initial installation, which includes structural steel, transformers for 6,000 kw. and other electrical equipment, is given in the accompanying table.

ESTIMATED COST OF OUTDOOR SWITCHING AND TRANSFORMING STATION

| | |
|---|---|
| Structural steel | $6,500 |
| Circuit breakers and switchboard | 60,000 |
| Wire and cable | 1,280 |
| Insulators and bus connections | 9,582 |
| Conduits | 469 |
| High-tension metering equipment | 5,500 |
| Four 2,000-kva., 114,000/2,100/4,150-volt transformers | 32,100 |
| Foundations and erection | 10,000 |
| Engineering | 3,400 |
| Total | $128,831 |

Cost per kilowatt, $21.47

## Favors the Venting of Transformers

OIL conservators have several advantages in connection with transformers and may be absolutely essential where the units are operated on lines rated at 220 kv., but their use is accompanied by operating and maintenance inconveniences that have induced at least one large company to vent the transformers directly to the air without any intermediate chloride breather or the like. This practice applies to all transformers used on the system, even including the 110-kv. units.

The chief objection to maintaining a head on the oil in the transformer tank is that unless eternal vigilance is practiced the oil will leak out through the gaskets around the head and manhole on the tank. To avoid this trouble labor of higher grade than is necessary on non-conservator tanks must be employed whenever the top of the tank or a manhole is opened and closed. Furthermore, the oil must be drawn down below the top of the tank before the top can be opened for any purpose whatsoever. This may, according to the company, entail considerable delay at times when every moment is valuable.

Because of these reasons the company has adopted the open-vent system allowing free circulation of air above the oil. No deterioration of oil whatsoever has been observed in transformers so vented for several years. However, the transformers have been operated at very low temperatures. On other systems the advantages of oil conservators may be more important than they are on this system, so that they should not be abandoned or their advantages overlooked where they are now used unless conditions are carefully compared.

# Extracts from an Operating Code

BY FIELD EDITOR ELECTRICAL WORLD
New York, N. Y.

## Instructions for Shutting Down Rotary Converters

WHEN shutting down rotary converters the load must be reduced to avoid throwing a sudden burden upon the other units in operation and thereby possibly tripping them out of service. If a rotary converter should be shut down from the alternating-current side first or if a total interruption of the alternating-current supply should occur, the machine would run as a direct-current motor and its speed might increase to a dangerous point. This is particularly true of a compound-wound rotary, which, because of the reversal of current in its series-field winding, operates as a differential compound motor with its well-known tendency to "run away." For this reason a standard rotary converter installation includes both a reverse current and an overspeed circuit-breaker-tripping device.

The voltage must be allowed to fall to a low value before the shunt-field switch is opened in order to prevent a bad arc.

The following instructions for shutting down rotary converters are given in the operating code employed by the Philadelphia Electric Company. The instructions for starting rotary converters may be found in the preceding issue of the ELECTRICAL WORLD:

1. Reduce the load on the converter to be taken off to as low a value as possible.
2. Trip the direct-current circuit breakers.
3. Open the positive and negative bus switches.
4. Open the rotary oil switch.
5. Open the starting, series field, equalizer and neutral switches.
6. Open the main-field switch and the booster-field switch after the voltage has decreased to a low value.
7. Raise the direct-current brushes (where a brush-lifting device is provided).
8. If the transformer bank is air-cooled by an individual motor-driven fan, shut down the fan; if air-cooled from a common air duct, close the transformer dampers; if water-cooled, shut off the cooling water.
9. Shut down the fan for supplying air to the rotor.

## Preventing Holes in Stoker-Fired Fuel Beds

HOLES in the fire bed are usually caused by stoppage of coal feed. They are developed by uneven resistance of the fire bed to the passage of air, a condition which occurs when the fire is clinkered or too thick elsewhere, or on account of an improper relation of stoker speed to wind box pressure, according to the operating code of the Philadelphia Electric Company. Holes in the clinker crusher pit are caused by improper adjustment of the crusher doors or by excessive speed of the crusher rolls.

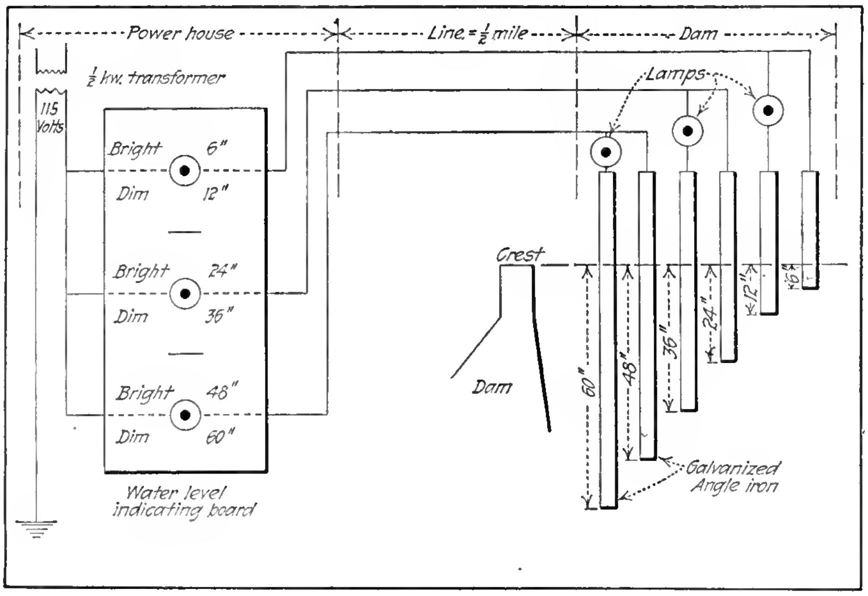
Following are the remedies as given in the above code:

1. Increase the stoker speed, cutting out the sections in which the fire may become too heavy.
2. Decrease the forced draft, if possible.
3. When a hole is near the front wall open the extension damper in the section in which the hole occurs.
4. See that coal is feeding into the rams at which holes occur and, if it is not, use wooden rods to force the coal to the rams.
5. If a hole is in the rear, put on the long stroke and close the extension damper.

## Water-Level Indicator for Small Hydro Plants

WHERE two or more hydro-electric plants operate in series on the same stream it is essential that some means be provided for accurately indicating the elevation of the water at all times in the lower dams, which in general are only diversion dams with but limited storage capacity. As the elevation of the water in dams between plants is dependent upon the adjustment of the load between them, a visual indication of the elevation of the water of such a dam is of great convenience in properly adjusting the load.

A very simple arrangement requiring a minimum amount of wiring and signal lines, the indications of which are independent of voltage variations and delicately adjusted resistances, has been used with success under the following conditions. The water for the upper plant on the river is supplied from a storage reservoir, the tailrace from this plant discharges into the river, and the water is again held by a small diversion dam about a half mile below. The water for the lower plant passes from this dam by a 5-ft. x6-ft. tunnel, the entrance of which is submerged 10 ft. below the crest of the dam. This tunnel carries the water to a small reservoir, from which point the penstocks go to the lower plant. If the water in the dam goes more than 5 ft. below the crest the pressure on the tunnel is not sufficient to supply the lower plant with the proper quantity of water to run up to capacity because of the small slope of the tunnel. It is the practice therefore to keep the elevation of the water in this dam between the limits of 6 in. and 60 in. below the crest. As the dam is of sufficient size to carry the full load of the plant for over an hour between these limits, the adjustment of the load between plants is not very difficult.



RELIABILITY IS A FEATURE OF THIS WATER-LEVEL INDICATOR

The indicating apparatus is installed in the lower plant and consists essentially of the following: An oak board painted black is mounted on one side of the switchboard where it is at all times visible to the operator of the plant. On this board three 110-volt lamps are mounted, the lettering and wiring being as shown in the accompanying illustration. Current is supplied from a small transformer and one side of the secondary is grounded. At the dam six pieces of galvanized angle iron are rigidly mounted on a wooden framework, and the lengths of the pieces are accurately adjusted to 6, 12, 24, 36, 48 and 60 in. below the crest of the dam. Three lamps are wired in circuit as shown, and three wires are run between the dam and the indicating board at the plant.

When the water in the dam is more than 60 in. below the crest there is no circuit and no lamps show up on the indicating board. As soon as the water reaches 60 in. there will be two lamps in circuit in series and the corresponding lamp on the indicating board will show up dim on half voltage. When an elevation of 48 in. is reached the lamp on the 60 in. iron is shunted out and the lamp on the indicating board burns brightly on full voltage. In the same way the board indicates the elevation for the four upper values. With a little experience an operator can tell the elevation within a few inches by the degree of brightness of the lamps, though for all practical purposes a knowledge of the elevation within a foot is sufficient except when the water is near the crest. At this point an indication is given for 6 in. to prevent the loss of any water over the top of the dam.

FREDERICK KRUG,
Superintendent of Hydro-Electric Plants.
Porto Rico Railway, Light & Power Co.,
Bayamon, Porto Rico.

## Illuminating Switchboard Instrument Scales

SATISFACTORY illumination of switchboard instruments — i. e., sufficient intensity to read the scales and detect the pointers without having glare—is apparently far from realization in most stations. It is not only a problem of properly placing the illuminant and diffusing the light, but of securing a dull finish on the board and instruments and selecting sufficient contrast between the scales, their background and the pointer. Both black and white scales with markings and pointers in the opposite color have been tried and each type has its advocates, one side contending that it is easier to detect the position of a white pointer on a black scale with white marking, whereas the other side contends that an instrument with a white scale and black pointer can be read at a greater distance.

The change from gooseneck lighting fixtures over groups of instruments to a lighting trough along the top of the board was some improvement and permitted more flexible arrangements of instruments with equal illumination. However, it still produces glare in some cases, especially where an attempt is made to secure fairly high-scale illumination intensity. One of the best forms of illumination witnessed recently is that where a translucent glass skylight is provided over and in front of the switchboard, daylight coming through in daytime and electric light from units placed above the skylight during other times. In another station very good illumination is provided by trough reflectors placed along the upper back edge of a benchboard running parallel to and in front of the instrument board.

# Changing from 7,800 to 13,200 Volts

**Five Generators Rewound by The United Electric Light & Power Company Without Interrupting Service—45,000-Volt Underground Cable Used**

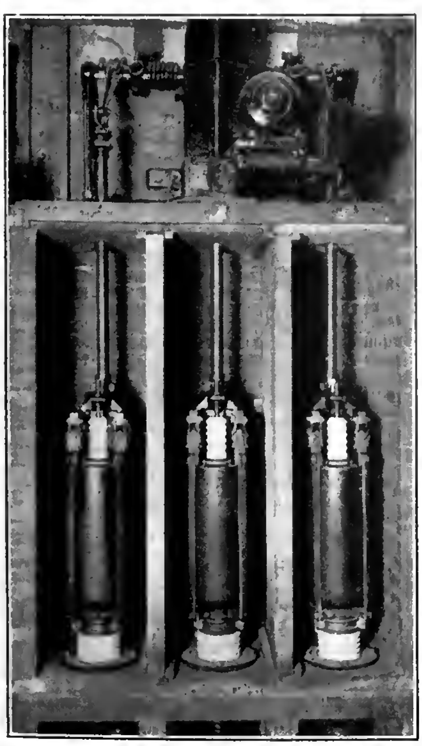
WITH the opening of The United Electric Light & Power Company's Hell Gate station in 1922 a study of generating and transmission economics indicated that a certain proportion of the Sherman Creek station, put in service December, 1913, should be changed from the original generating voltage of 7,800 to the higher 13,200-volt standard. The original design of the station called for a total capacity of 120,000 kw., but the primary installation consisted only of three 15,000-kw., 19,000-kva. turbo-generators furnishing energy at 60 cycles and 7,800 volts. As the demand warranted, the station was completed by adding, one at a time, three 60-cycle units of 22,000-kw., 25,900 kva. rating each. This was subsequent to the installing of two 25-cycle units of 20,000 kw. each soon after the station went into operation, precipitated by a contract to furnish energy at 25 cycles to the New York, New Haven & Hartford Railroad. These deliver energy at three-phase, but the generators have a special single-phase rating of 14,300 kva., required by the characteristics of the service.

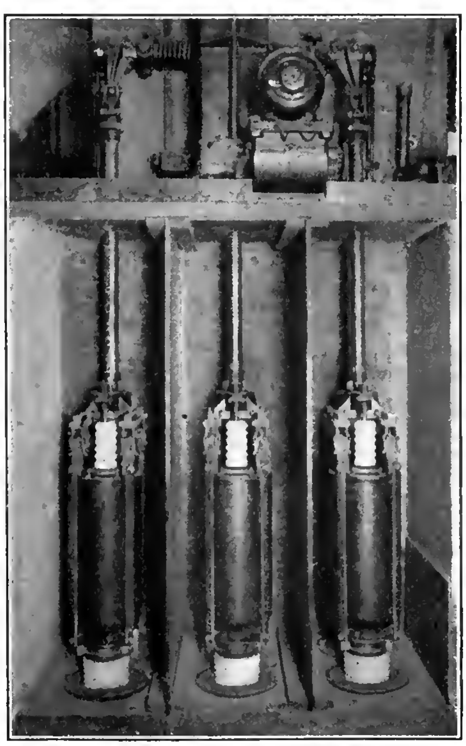
Up to the time of the change-over a portion of the 60-cycle energy was transmitted over radial feeders to nearby substations at 7,800 volts, and the remainder—for transmission to more distant points—was stepped up by transformers in the station to 13,200 volts. For this latter service all the switching was at the generated voltage, 7,800, the transformer being considered a part of the feeder.

There were three sections of bus in duplicate for the 60-cycle service, connected to form a ring, so it was decided to change two of these bus sections to the higher voltage as well as five of the six generators. By working according to a program no considerable loss of service of apparatus or feeders was experienced. The generators were taken out of service one at a time and rewound, for the higher voltage, two of the old frames and three new frames being employed. Coincident with this the switching equipment was changed so that as each generator was ready for service it could be connected to the proper equipment. By tying the two voltages together through transformers it was possible to keep a balance between the generator capacity and feeder capacity changed over.

FEEDER REACTOR AND POTENTIAL TRANSFORMER COMPARTMENT

Because it was impossible to secure delivery of several switches at the time that the change over from 7,800 volts to 13,200 volts was started, much manipulating of the few extra switches on hand was necessary for continued service. With only four spare switches on hand, four switches were torn down from their compartments in the northeast





SPACE FORMERLY OCCUPIED BY 7,800-VOLT SWITCHES MADE AVAILABLE FOR 13,200-VOLT BREAKERS BY SUITABLE BARRIERS

Left—2,000-amp. type H-6 oil switch mounted for service at 7,800 volts before remodeling for 13,200-volt service.

Center—2,000-amp. type H-6 oil-switch compartment rebuilt for service at 13,200 volts.

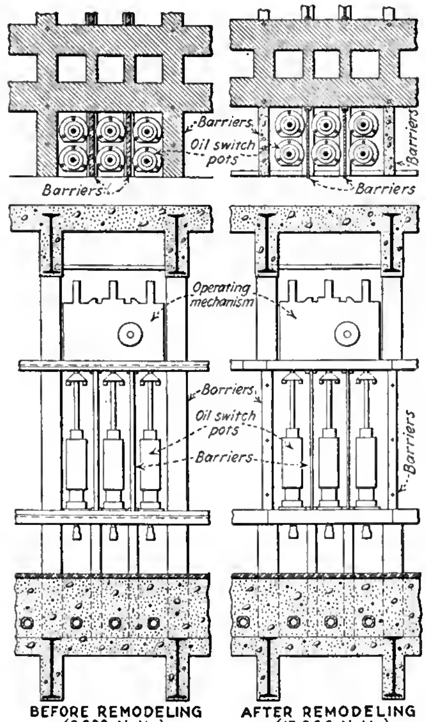
Right—Type H-203 oil switch mounted for 13,200 volts in space formerly occupied by H-3 switch that operated at 7,800 volts.

corner of the building, where the change-over took place, and were set up again where space permitted in the southwest section. Then the feeders were brought over in a similar manner and connected to the switches in the southwest corner. The interchanging of the apparatus to the extent of seven groups was completed before the compartments were rebuilt for the higher voltage. Subsequently the remaining switches and feeders were shifted, one or two at a time, and the compartments reconstructed, until thirteen groups had been changed over to the higher voltage.

Most of the work was done between midnight and 4 o'clock in the morning, on Sundays and during the summer months. It required from May, 1920, to November, 1921, to accomplish the complete transformation.

At this writing the three 15,000-kw. units and one 22,000-kw. unit have been put into operation at the higher voltage. The remaining unit to be changed has been rewound for the higher voltage but has been connected delta for operation at 7,800 volts until the equipment changes have been further advanced.

Oil switches at this station are of the General Electric type H-3 in sizes up to 1,500 amp. and type H-6 in 2,000-amp. and 3,000-amp. sizes. The former were installed in cells of 51-in. centers separated by 8-in. brick walls. The phases of each switch were separated by removable Alberine barriers 2½ in. thick, leaving a cell 15 in. wide for each oil tank. The H-6 switches are mounted on 61¼ in. centers with walls of the same thickness but with phase barriers 2½ in. thick. The arrangement of the steel of the building as well as the space limitations precluded any plan which would require more space per switch; yet the oil switch itself would be suitable for the higher voltage if mounted with larger spacing. To meet these conditions the 8-in. brick walls were replaced with precast reinforced-concrete slabs, 4 in. thick, set into the back wall. The phase barriers were replaced with ½-in. barriers of ebony transite.



REDUCING WALL AND BARRIER THICKNESS PROVIDES ROOM FOR 13,200-VOLT SWITCHES

It was necessary to replace entirely all of the reactors with new ones designed for the higher voltage. These could not be designed to be contained in the space as provided. It was found, however, that a coil could be designed which would not require any more width, so that it was only necessary to build the compartments to allow more space in a direction at right angles to the line of the switches.

On account of the increase in station capacity over the original design and the advisability of maintaining an adequate system of tie connections with the Hell Gate station and with the stations of the allied companies, it was found necessary to increase the switchboard capacity over that originally installed. In the original design each exciter and each transformer bank for house service was fed from an individual switch in the same manner as an outgoing feeder. To release these switches a house bus with the necessary equipment was installed, fed through reactors from the 7,800-volt bus. Installed on this structure is the equipment for eight feeders to exciters and auxiliary transformers. It is equipped with General Electric type K132B switches.

Transmission economics pointed to a further change in the supply to the territory north of the station. As a preliminary to a general system of high-voltage service a 45,000-volt cable connection is being installed between the Sherman Creek station and the New Rochelle station of the Westchester Lighting Company. To supply this at Sherman Creek, outdoor transformers have been installed which step the voltage up from 13,200 to 45,000. The present installation consists of six oil-cooled, single-phase transformers of 4,200 kva. each, star-connected on the high side and delta-connected on the low. The 45,000-volt service is over three single-conductor, lead-covered cables installed in the standard duct system.

Arrangements are being made toward increasing the boiler capacity either by installing new boilers or making elaborate changes on a number of those now installed.

OUTDOOR TRANSFORMER STATION WILL ENERGIZE 45,000-VOLT UNDERGROUND CABLE TO OUTLYING DISTRICT

# Central Station Business

**Advertising, Selling and Service Methods**
**Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences**

## Profitable Merchandising

**By Careful Attention to Territory Conditions, Methods of Selling and Rapid Stock Turnover an Illinois Central Station Realizes a Neat Profit on Appliance Sales**

IN PUTTING its appliance sales on a profit-making basis the Bloomington & Normal (Ill.) Railway & Light Company has demonstrated the possibilities of this business as a revenue producer for the central-station company when proper consideration is given to the nature of the territory served, the goods handled and the manner of selling. The field served by the company takes in Bloomington and Normal. Ill., with a combined population of 33,650, and through transmission lines about a dozen small towns within a radius of 30 miles. The total population of the territory is approximately 50,000. In addition to supplying electric light and power service in this territory the company operates the street railway and furnishes steam heat in Bloomington.

### Method of Operation

The organization of the company provides for a local manager in each small town or group of towns. This is necessary in order to give adequate service, and these men, because of the variety of work they are called upon to perform, must be rather versatile in their experience. Their work incident to the actual operation of the system requires only a part of their time and the rest is available for other effort. Most of these towns, with populations of less than 1,500, have no shops which sell electrical appliances or do the work of an electrical contractor. The sale of electrical energy alone does not provide enough revenue to pay the local manager and leave a return for the company. It is nevertheless necessary to have a man on hand in case anything goes wrong. The natural result is to use the spare time of the local manager in merchandising electrical appliances. In these smaller towns the local manager also does the wiring work of the community.

An ample stock of appliances is kept at the headquarters offices, and there too the company is in the merchandising business. Originally merchandising was conducted under the office and electric distribution departments without a definite line of authority and without an aggressive selling policy. Even this arrangement helped to reduce operating costs in the small towns, but the profit it earned was small.

### Development the Result of Necessity

D. W. Snyder, Jr., manager of the company, says: "In 1919 rising costs, coupled with the inability to increase rates, caused us to turn to the one department which was not regulated as to rates and which would not require a great deal of new capital to develop. We established a merchandising department in charge of a commercial manager, ranking him with the other department heads. This department handles all merchandising and new business except certain types of industrial business which remain in the electrical distribution department.

"The policies of the new department were: (1) To do no housewiring in the cities or towns where there were electrical contractors able to do the work, (2) to sell only those appliances which had merit and would stay sold, (3) to co-operate with local dealers and to maintain fair prices, (4) to so conduct the merchandising department that electric energy sales would increase, the use of electric appliances would become popularized, and generally to better the service to the community.

"Results were immediate and satisfactory. New records for sales volume, net profits and meter connections were made. The next year, 1920, showed still better records. Daily sales that year averaged $500 and the net revenue earned was $36,244.50, from which was deducted $9,153.85 for advertising and new-business development expense, which we charged to the merchandising department to offset office rent and other items of general overhead. In addition to the above earnings, the merchandise department made possible many savings in operating expense. The average merchandising stock was $28,000, which includes the stocks in the small towns. The stock had a turnover of five and a quarter times in 1920. Approximately $25,000 was tied up in accounts, some of it being on time payments on which interest was charged. Those accounts could have been discounted through a bank or discount corporation, but instead we carried them ourselves. In a short time the company built up a revolving fund sufficient to carry the time-payment accounts.

"The results shown in Table I were reached in a small town of 1,300 population and show the value of the merchandising department. The

TABLE I—APPLIANCE SALES IN TOWN OF 1,300

| Appliance | No. | Amount |
|---|---|---|
| Vacuum cleaners | 24 | $1,563.25 |
| Washing machines | 11 | 1,544.00 |
| Heating appliances | 56 | 902.20 |
| Fans | 3 | 84.00 |
| Motors | 6 | 390.00 |
| Lamps, wiring, etc. | | 3,499.41 |
| Total | | $7,982.86 |
| Expense | | 5,437.60 |
| Gross profit | | $2,545.26 |
| Advertising (local) | $208.00 | |
| Portion commercial manager's salary | 155.00 | |
| Miscellaneous expense | 120.00 | 483.00 |
| Net profit | | $2,062.26 |
| Local stock on hand (average) | | 950.00 |

capital investment in the local stock was kept low compared with the volume of sales as the central stock could be drawn on when needed."

In directing his department the commercial manager uses sales talks, educational letters and tabulated reports of the business done in each town. This serves to keep up the enthusiasm and creates a spirit of friendly rivalry which is a great sales help. All members of the staff are paid salaries except the men who sell vacuum cleaners. These are sold

on the co-operative plan by which the district manager for the manufacturer furnishes the trained salesmen and supervises their work. This plan rids the commercial manager of the need for giving his detailed attention to sales of electric cleaners and releases his time for other matters. Nearly every month some one appliance is featured in special sales effort, but seldom, if ever, is there any cut in the price. Most of the appliances are demonstrated, sold and serviced in the homes of customers.

### Importance of Advertising

Mr. Snyder says: "Advertising, backing up the personal solicitation, is the most important part of the sales promotion work." That Mr. Snyder believes this is shown by the fact that he devotes approximately 4 per cent of the gross sales to advertising, most of it going into newspapers. A separate advertisement is used for each appliance. "It is advisable to keep in mind," he says, "that a newspaper advertisement is like a display window—if it is cluttered up with several things, it becomes less effective. It is the same as with salesmen; if they concentrate on one appliance they can sell it effectively, whereas divided effort results in divided and diminished volume. Some days we have as many as three advertisements in one issue of a newspaper. We advertise three and four times per week in both local papers, and in the smaller towns where there are weekly papers we use them regularly.

"One of the daily papers carries an electrical page every other week on which many of the dealers and contractors advertise. This feature gives us a page devoted in both advertising and news to electrical matters. The electrical page is the result of the broad way in which the electrical dealers of the city have come to look at the joint problems of those in the appliance selling business.

"In recent years we have been heavy newspaper advertisers, and at one time some of the contractor-dealers thought the advertising done by the central station was aimed at them. It was pointed out, however, that the advertising was intended to attract the buying power of the public to electrical lines, and we suggested that the dealers increase their advertising expenditures, not in the spirit of competing against one another, but rather as a concerted effort on the part of the electrical trade competing against the field. The combined sales of the contractor-dealers each year since that time have shown healthy increases, which proves the soundness of the theory. In addition to the newspaper advertising we carry cards in the street cars and follow up 'prospects' by using letters and inclosures with our mail."

The extent to which one appliance can be "put across" depends on its quality and degree of usefulness to the householder. Table II shows how generally the Bloomington & Normal Railway & Light Company has sold the vacuum cleaner to customers.

These figures show the results which can be obtained by organization, concentration and persistence. More than 20 per cent of the homes in these towns have bought vacuum cleaners. Mr. Snyder says: "There is no such thing as saturation, at least so far as we now see it, as the number of new customers each year exceeds the number of cleaners and washing machines which the company has been able to sell. For the last four years our company has averaged nearly one hundred new customers per month, and our sales of these appliances have not nearly reached this proportion."

"Through selling electrical appliances," says Mr. Snyder, "we have been able to have a good man at each point ready for any emergency which might arise. We have built up our system and loaded our lines through wiring the small-town homes and selling them energy-using household appliances and have brought up our earnings per capita. It is our belief that the central-station company owes it to its customers to maintain a properly organized merchandising department, not as a competitor of the contractor-dealer, but to co-operate with him in serving the already existing needs and to develop the almost untouched field before us."

TABLE II—VACUUM CLEANER SALES

| Town | Population | Wired Homes | No. Cleaners Sold | Wired Homes per Cleaner | Population per Cleaner |
|---|---|---|---|---|---|
| Bloomington | 33,650 | 6,686 | 1,559 | 4.29 | 21.59 |
| El Paso-Hudson | 2,097 | 556 | 113 | 4.93 | 18.56 |
| Gridley | 890 | 300 | 63 | 4.76 | 14.13 |
| Flanagan | 637 | 167 | 19 | 8.79 | 33.53 |
| Chenoa | 1,314 | 374 | 75 | 4.99 | 17.52 |
| Lexington | 1,301 | 304 | 72 | 4.22 | 18.07 |
| Morton | 1,194 | 395 | 23 | 17.17 | 51.95 |
| Tremont | 976 | 181 | 6 | 30.17 | 162.67 |
| Total | 42,059 | 8,963 | 1,930 | 4.64 | 21.79 |

## Improved Lighting of 32 Stores Adds Revenue

SOME remarkable results have been achieved by the Cleveland Illuminating Company through improving the quality of illumination in stores and at the same time increasing the lighting load in existing installations. Two illuminating experts in a period of sixty days have increased the annual revenue from thirty-two small stores by about $4,000 and improved the service in many others.

A small district in the city was chosen for the work, the very large stores in the section being passed over until a later time. The two men took two weeks to make a survey of the lighting in the stores and entered the survey data in detail on cards. A total of 388 stores were surveyed, and 233 of these were selected as needing attention at once to improve the illumination. A group of 100 stores at a time received letters offering the service of the illuminating experts, and these letters were followed up with cards, literature and personal visits. About 25 per cent of all the stores returned an inclosed postal card asking the company men to call. The fifty-two stores obtained from the cards were increased by fourteen other stores obtained incidentally, so that a total of sixty-six stores were treated by the experts. Thirty-two of these stores installed larger lamps and new fixtures, cleaned old fixtures, raised and lowered fixtures or rearranged their illumination. Thirty-four others have decided to make changes in accordance with the recommendations of the experts.

The whole idea of the new department is to render better service, and in many cases no new revenue was obtained, but the lighting service was improved by cleaning or rearranging the existing installation. The service has been well received by the customers and has proved profitable to the company. The plan is to work one district at a time until it is completely serviced and then proceed to take up successive sections of the city.

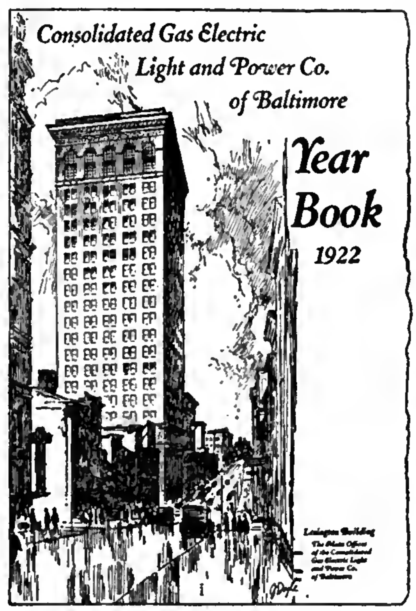
## Baltimore Company Gives Full Information in Year Book

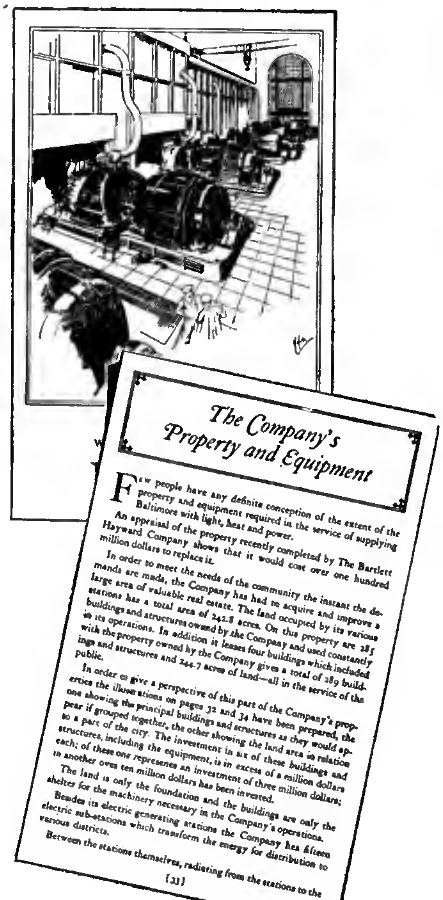
THE Consolidated Gas, Electric Light & Power Company of Baltimore has done a notable thing in publishing for the benefit of its shareholders and the public a year book which gives in A B C form all the information that stockholders want bearing upon the condition of their property. The year book, which is edited by Arthur W. Hawks, Jr., of the Baltimore company, fills a long-felt want, and other electric light and power companies could emulate it with profit.

Many annual reports are wholly unintelligible to the average stockholder. He studies the figures sometimes, but when he has finished he knows about as much of the condition of the property the report deals with as he did before. This confusion and apparent obscurity are obviated in the Baltimore company's book.

There are nearly seven thousand residents of Baltimore and vicinity who own shares of stock in the company. More than a thousand of these are employees and by far the greater number own from one to ten shares. The management of the company believes that these stockholders have just as much right to know the true condition of the company as have the men who sit on the board of directors or those who own big blocks of stocks. For this reason the year book has been published. This policy is set forth in the preface:

"Public service is a public trust and, though the year book is issued primarily for the company's stockholders and other investors in its securities, copies will be available to all who are interested in the company's affairs, either as customers, as prospective investors, or as students of the history of the growth of Baltimore with which its Gas & Electric Company is inseparably connected. The Consolidated Gas, Electric Light & Power Company of Baltimore is not of Baltimore by name and place of business only. It is of Baltimore by inception, by organization and by ownership. It is not owned by a few capitalists. It is owned by 10,375 stockholders, the majority of whom live in Baltimore and vicinity. It is operated by Baltimore men and women for the benefit of the people of Baltimore as well as in the interests of the stockholders. Its allied services of electricity and gas are intimately interwoven in every activity of the life of the city. The welfare and progress of Baltimore are the welfare and progress of its Gas & Electric Company."





COVER AND SOME INTERESTING PAGES FROM BALTIMORE COMPANY'S YEAR BOOK

## Results of Central-Station Publicity*

**Organization of Information Bureaus —N. E. L. A. Opportunities and Progress in Telling of the Industry**

BY C. L. EDGAR

President Edison Electric Illuminating Company of Boston

THERE are at the present time nineteen public utility information bureaus, established in twenty-seven states, and two bureaus in the course of formation. The managers of these various bureaus meet at least twice a year—once at the National Gas Association convention and once at the National Electric Light Association convention. They compare notes, consult with one another and have a little convention of their own. I attended one of their luncheons and meetings in Atlantic City last spring and was very much impressed with the character of the men and with the breadth of their vision.

There are 127 companies in the New England bureau, the running cost of which is about $20,000 per

*From an address before the New England Division, N. E. L. A., March 8, 1923.

year. The bureau issues about 2,500 weekly bulletins, 1,000 of these going to newspapers throughout New England. J. B. Groce, the director and his assistants clip all the daily papers and those of the weekly publications which have any considerable circulation. The material sent out by this bureau has been copied by every daily newspaper in New England—that is to say, the articles sent out have been used in the news or editorial columns. Many of these articles have been published at least six months after the bulletin was issued, thus proving conclusively that the newspapers feel that this material is of value and keep it on file for future reference. One recent editorial was composed of parts of six bureau articles published at different times. Up to date there have been copied about 125 pages equal in size to the first page of the Boston *Herald*. This includes only the papers that are clipped. It is generally considered that the smaller papers which are not clipped would add 25 to 33⅓ per cent to this amount. It is, therefore, safe to assume that from 150 to 175 pages of this material have been reproduced in New England newspapers during the last eighteen months. At advertising rates this would cost $150,000 to $175,000.

It has been a liberal education to come into contact with the men connected with the other branches of the industry. We meet at luncheon every Monday. Two representatives of the Boston Consolidated Gas Company, two from the street railways, two from the New England Telephone & Telegraph Company, two from the electric companies and two representing combination gas and electric companies compose the committee. The attendance at these meetings is bound to carry the conviction that the committee takes the matter seriously.

In spite of what has been said, I want to voice a note of warning. The work of the bureau is not intended to take the place of company activity. It is merely to supplement it. It is to show us how to advertise and to get publicity. I think the majority of the members of the bureau have looked at the question from this standpoint. I don't believe that many of them have "lain down on their jobs" and said to themselves, "As long as the bureau is doing this work, why worry?"

Two hundred of the leading central stations in the country are spending $3,000,000 a year in advertising. This means about one-third of 1 per cent of their gross earnings. In the Boston Edison company we are spending 1 per cent, which is three times the average, and I am perfectly willing to admit that I do not think that we spend enough. We all ought to spend more. The average manufacturer spends from 2 to 5 per cent of his earnings. This would mean in the case of the Boston Edison company three-quarters of a million dollars per year. Of course, I could not see my way clear to suggest such an amount as this, but it does show where we stand on the question of advertising compared with the manufacturing industry.

### N.E.L.A. to Spend $100,000 on Advertising

This year the National Electric Light Association will spend $100,000 on advertising—some of it out of the association's own treasury and some of it underwritten by the larger central-station companies. The bulk of this is going into farm magazines.

Another activity of the national organization has to do with the advertising campaign of the manufacturers. They have, of course, been accustomed to spend large amounts of money each year in advertising their products. As a result of conferences with the officials of the association they are now giving a certain percentage of their advertising space to telling our story. We are thus really getting the benefit of their advertising campaign.

One of the most interesting lines of advertising promoted by the N. E. L. A. is in the development of motion pictures. Now that this country has become a nation of "movie" patrons, it is well that our industry should take advantage of this fact to the fullest extent. The national organization has got out two films which have been shown in hundreds of theaters before many thousands of people. It is now preparing a third film for this same purpose. The Boston Edison company has also made a film telling the history and operation of the company from the coal mine to the customer. This film is to be shown at least once a day at the national convention of the Association to be held in New York in June. It cost between $4,000 and $5,000 and is the starting point of tremendous possibilities in bringing the activities of our industry to the favorable attention of the people.

## What Other Companies Are Doing

**Atlanta, Ga.**—The employees of the Georgia Railway & Power Company have organized an association known as the Power Club and elected F. A. Brine president. The objects of the organization are to foster and promote the interests of its members through association, to encourage their active participation in amusements, athletics and other educational and helpful activities, and to work for their mutual advancement.

**Colorado.**—The Colorado Power Company of Denver recently sponsored a moving picture which was displayed in many of the cities of the state. The picture was entitled "Yours to Command" and showed what electricity would do for the housewife and the public in general.

**Cushing, Okla.**—A fire on Feb. 10 destroyed the power plant of the Minnesota Light & Power Company, which served this city. The Oklahoma Gas & Electric Company connected its high-tension transmission line within a short time, gave Cushing service and as a result secured a ten-year contract to supply power wholesale, the Minnesota company selling it at retail.

**Bucksport, Me.**—As an immediate result of the extension of service by the Central Maine Power Company into the Castine district forty-eight of 102 homes located along the line have been connected with the system and various local industries are receiving attention, with the prospect of new enterprises coming into the Penobscot territory.

**Boston, Mass.**—As a means of increasing the use of electric appliances by central-station employees, three manufacturers are offering electric ranges to the employees of the Edison Electric Illuminating Company at 50 per cent discount off list. The offer is made in the belief that employees, by using electric ranges in their homes, will be better able to talk to customers about the advantages of these appliances.

**Providence, R. I.**—Rapid progress is being made on the six new buildings which will constitute the general service plant of the Narragansett Electric Lighting Company on Melrose Street, Providence. One feature of the plant will be a newly equipped meter-testing laboratory designed for artificial control of both temperature and humidity.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Development of Small Water Powers.* —R. P. HART.—The application of remote control to substation and generating plants has a ready application to the utilization of small water powers. As a typical instance of this, the author describes a water-power site redeveloped with a remotely controlled station and operated in parallel with another plant 3,000 ft. away. This plant consists of a 225-kva., 2,300-volt, 600-r.p.m., 60-cycle, three-phase alternator, to which a 125-volt exciter is directly connected. — *Power*, Jan. 30, 1923.

*Power Plant Using Natural Steam.*— W. WIEDER.—Natural steam at a pressure of 3 atmospheres flowing from wells drilled in volcanic strata at Larderello, Italy, is used in a 7,500-kw. plant. To avoid corrosion of the turbine blades the steam, which contains about 5 per cent non-condensing gases and emerges at a temperature of 180 deg. C., is used to heat a water evaporator. This steam operates the turbine, running at a speed of 3,000 r.p.m. Three-phase, 5,000-volt, 50-cycle energy is generated, and this is stepped up to 36,000 volts for feeding four transmission lines, supplying metallurgical and chemical establishments. Several 16,000-volt lines supply nearby customers. A new geothermic plant in Lago, intended for 10,000 kw., is under serious consideration. Considering the necessity of evaporators, the large-type turbines and pipe lines due to the low pressure and the considerable losses in these the economy of this plant is not so high as might be expected.—*Elektrotechnische Zeitschrift*, Feb. 8, 1923.

*Automatic Control Apparatus for Control of Oil-Burning Furnaces.*—A temperature and pressure controller for use in connection with furnaces and boilers, which is asserted to save from 10 per cent to 30 per cent in fuel oil, is described. This device uses either air or steam for atomizing the oil.— *Iron Age*, March 1, 1923.

## Generation, Control and Switching

*Present Status of Overvoltage Protection.*—G. BENISCHKE. — The author criticises some of the apparatus now used to avoid disturbances due to excess voltages. He claims that if any other effective protective apparatus is installed, the use of a grounding wire above the transmission wires is without value. Small overvoltages can be easily taken care of with water-jet grounding devices or large ohmic resistances permanently connected to the lines. The best protection against large overvoltages is still the horn gap with a series resistance and a sufficiently large choke coil. Recently introduced oil-immersed resistors, with a contactor either to shunt a part of the existing resistance or to introduce a previously shunted resistance, are rejected by the author on account of their moving parts. He prefers a horn gap with a magnetic blow-out. A satisfactory protection against large overvoltages is possible only with several horn gaps on the same line and an iron-core choke coil in the branch toward the consumer. Little attention is being paid to the proper design of these choke coils. It is essential, the author points out, that their self-induction per unit length of winding shall be many times higher than that of the line ahead of it. A coil consisting of a few turns, 1 cm. or 2 cm. apart (bed-spring type), he claims, is absolutely useless and coils with open iron cores are advocated instead. Disk coils wound like a watch spring with a ribbon of copper and a ribbon of iron, insulated from each other, are effective choke coils. Praise is given to a new brush discharge protector which consists of two flat electrodes separated by an air gap and a tumbler-shaped glass vessel. Beyond a critical voltage brush discharge takes place between the electrodes and over the rim of the glass. Condensers and aluminum or lead peroxide arresters are now condemned even by those who originally advocated them as they cause overvoltages. The effect of quenching choke coils and quenching transformers, lately looked upon as the universal overvoltage protectors and used frequently quite promiscuously, is not fully known as yet. Having caused a number of transformer breakdowns, the further installation of these coils was not recommended at a recent meeting of German operating engineers. One of the safest means to avoid overvoltages is to prevent higher harmonics in the wave form, which can be achieved by a short-circuit damping winding in the pole pieces of the generators and synchronous motors.—*Elektrotechnik und Maschinenbau*, Feb. 18, 1923.

*Frequency Conversion by Third-Class Conductor.*—C. P. STEINMETZ.—Attention is drawn to the so-called "third-class conductors"—a class to which arcs and gas discharges belong—in which the voltage decreases with increase of current. It is shown that these conductors can be considered as a combination of a negative resistance with a source of power and as such are capable of transforming the low machine frequency into a high oscillation frequency of alternating currents. Their presence in an electric system may thereby produce cumulative oscillations. The general equations are then derived for a system comprising a third-class conductor shunted by an inductive circuit containing capacity and supplied with voltage over an inductive circuit from an alternating low-frequency source.—*Journal of the A. I. E. E.*, March, 1923.

## Transmission, Substations and Distribution

*Polymorphous Machines.*—G. M. PESTARINI.—An interesting study of the so-called polymorphous machines—viz., machines which are able to link up two systems of different characteristics and transform electrical energy is given. With the practical use of those machines the reliability of the electrical energy would be increased. The author discusses the transformation of direct-current energy from constant voltage to constant current, transformation from polyphase alternating current to direct current and the reverse, transformation from polyphase current to polyphase current of different frequency, from single-phase current to balanced polyphase current and vice versa, and from pulsating energy to continuous energy. Industrial applications are also described and electrical railway operations with polymorphous machines investigated. — *Elettrotecnica*, Dec. 5 and Dec. 15, 1922.

*Artificial Electric Lines.*—H. NUKIYAMA and Y. SHOJI—A "T" and "Π" section of an artificial line may be combined in a series in order to make the frequency characteristics of the artificial line more close to those of the uniform line to be represented. The authors treat the combined T and Π line as a homogeneous line by suitable combinations of the neighboring sections of each.—*Journal of Institute of Electrical Engineers of Japan*, February, 1923.

## Units, Measurements and Instruments

*Measurement of Radio Signals*—C. R. ENGLUND.—A portable compact measuring unit for incoming signal strengths has been worked out capable of measuring from 3.5 microvolts per meter up at 23,500 cycles. The measurements are made by a primary comparison with a locally generated electromotive force by means of a highly selective receiving unit and a 600-ohm artificial line box especially made for this purpose.—*Proceedings of the Institute of Radio Engineers*, February, 1923.

*Various Photo-Electrical Investigations.* — W. W. COBLENTZ. — Miscellaneous data which were obtained in connection with the general investigations of photo-electrical investigations are given in this paper. Data are given on the photo-electrical sensitivity of artificial preparations of molybdenum sulphide, molybdenite, stibnite and iodine. The effect of heat and

electrical treatment upon the photo-electrical sensitivity of molybdenite and stibnite and the spectrophoto-electrical curves of cuprous oxide and of lead antimony sulphide are also given.—*Scientific Papers No.* 462, *Bureau of Standards.*

## Motors and Control

*Industrial Power.*—J. A. BURNETT.—The author first demonstrates the advantages of electric power for industrial plants and then discusses in detail the various features involved. Comparisons of direct current and alternating current for power, operation of motors, bearings and lubrication, range of voltage and power-factor characteristics are among the more important points discussed.—*Electrical News,* Jan. 15 and Feb. 1, 1923.

*Calculation of Steps for Motor Starters.*—L. BINDER.—The author develops a simple graphical method to determine starter steps for motors. With slight variations this method can be used for all types of direct-current or alternating-current motors. Full details are given for the series direct-current motor, the shunt direct-current motor with field shunting, the alternating-current series motor and the three-phase induction motor.—*Elektrische Betrieb,* Feb. 10, 1923.

*Electric Drive in Coal Mines.* — W. PHILIPPI.—The extremely low efficiency of compressed-air drive for drills, coal cutters, fans, etc., in coal mines is forcibly established by an elaborate report made after a study of twenty-six mines and the advantages of introducing the electric drive are described. The danger of igniting explosive gases from sparks or arcs due to the electric drive has been virtually eliminated by using interlocked contacts and switches with breaker under oil, or within a chamber equipped with plate protectors. Three-phase current only is considered, because it gives the simplest and safest motor. The author described the latest electric-driven coal drills, reciprocating hammers, coal cutters, firing switches, ventilators, shake conveyors and various other equipment suitable for electric drive. — *Elektrotechnische Zeitschrift,* Jan. 18, 1923.

## Heat Applications and Material Handling

*Electric Arc Welding Apparatus and Equipment.*— J. CALDWELL.—The author deals with the physical features of the iron arc as used for welding ferrous metals as far as those features are known, indicating some of the lacunas in present knowledge, and describes the general types of apparatus, with examples of each type, and some of recent design which promise well. Operating or workshop methods are touched on only so far as they illustrate or determine, or are determined by, the physics of the welding arc and the practical requirements of welding.—*Journal of the Institution of (British) Electrical Engineers,* February, 1923.

## Electrophysics, Electrochemistry and Batteries

*Gases in Metals.*—LOUIS JORDAN and F. E. SWINDELLS.—The determination of combined nitrogen in iron and steel and the change in the form of nitrogen by heat treatment are investigated. It has been found that the treatment of certain steels increased the amount of nitrogen as determined by the Allen method. This increase has been found in an electric furnace silico-manganese steel, in a plain carbon steel from the outside pressure of an autoclave plate and in a series of electrolytic iron ingots. — *Scientific Paper No.* 457, *Bureau of Standards.*

*Permanent Magnet Steel.*—E. GUMLICH.—Extensive research work carried on in the Physikalisch Technische Reichsanstalt (the Bureau of Standards of Germany) with various steel alloys suitable for permanent magnets resulted in the discovery of an alloy steel with considerably improved magnetic properties. Based upon previous tests on iron-manganese steel with an addition of cobalt, the saturation of the steel has been increased beyond values previously known on chromium and tungsten steel. A further improvement was achieved by adding 5 per cent of chromium, resulting in a three times higher product of remanence and coercive force. Tabulations are given with full test data of the new steel alloys, depending on the method of tempering the steel in water or in oil and the tempering temperature. The best results were obtained with an alloy containing 1.1 per cent carbon, 3.5 per cent manganese, 36 per cent cobalt, 4.8 per cent chromium and 54.6 per cent iron.—*Elektrotechnische Zeitschrift,* Feb. 15, 1923.

## Telegraphy, Telephony, Radio and Signals

*Relations of Carrier and Side Bands in Radio Transmission.*—R. V. L. HARTLEY.—The modulation of a carrier wave by a signal wave and the subsequent reproduction of the signal wave are discussed in terms of the sustained sinusoidal components into which the various waves may be resolved. The conception of a modulated wave as being made up of a carrier component and two side bands is explained. The saving in frequency range resulting from transmitting a single side band is emphasized. Equations are derived for the distortion of the reproduced wave in terms of that of the modulated wave. The effect on the signal of various typical distortions of the radio wave is examined for both single and double sideband transmission, as is also that of altering the phase of the locally supplied carrier and of altering its frequency. The resulting distortion of the signal is found, in general, to be more serious for telephony when both side bands are used and for telegraphy when only one is used.—*Proceedings of the Institute of Radio Engineers.*—February, 1923.

*Super-Regenerative Circuits.* — A. RINGEL.—The author presents fifteen different super-regenerative circuits. In these circuits the variation frequency is applied both to the grid and the plate of the regenerative tube and radio-frequency amplification is used. Arrangements are described for different forms of circuits for the oscillator, and the constants and dimensions of the various coils, condensers, etc., are given.—*Wireless Age,* March, 1923.

*Electric Oscillation in Three-Phase Aërial Line.*—S. BEKKU.—The author has developed a series for calculating the inductance interference of parallel lines, such as a power line alongside a telephone circuit, for any value of the coefficients of magnetic induction and has obtained results indicating that, where there are $n$ wires, $n$ traveling waves of different propagation velocities exist on each wire in general.—*Journal of Institute of Electrical Engineers of Japan,* February, 1923.

## Traction

*Present Status of Railway Motors.*—K. SACHS.—The author gives a critical account of the latest types of railway motors for direct-current, single-phase and three-phase operation. Six sectional drawings and six photographs of motors that are given should be of particular interest to designers. A narrow-gage direct-current street-railway motor with an unusual ball-bearing arrangement and a 1,390-hp. three-phase locomotive motor for the Italian railways call for attention.—*Elektrotechnik und Maschinenbau,* Jan. 1, 1923.

*New Repair Shops at Boston.*—The extensive repair shops which the Boston Elevated Railway is now building near the Everett terminal will occupy a tract of 22½ acres, making them one of the largest of the kind in the world. How the work will be routed through the various departments, which are so arranged as to keep the travel of heavy parts to a minimum, is the principal subject discussed.—*Electric Railway Journal,* Feb. 10, 1923.

## Miscellaneous

*Electricity in Therapeutics.* — DR. LOUIS SAMENGO.—Two papers presented at the medical congress held in Buenos Aires in October, 1922, and reprinted in French. One deals with the transillumination of the sphenoidal sinuses by a nasal pharyngoscope through which an electric wire is carried connected with a minute lamp operating on 5 volts. The other concerns a "thermo-injector," the liquid contained in which is heated through the electrical connection of the syringe to a 15-volt regulator. By means of this regulator the voltage on the syringe can be varied from 3 volts to 15 volts and by adjustment each division of the regulator can be made to correspond to a distance temperature, permitting the injection of the liquid at a constant gradation of heat.—*La Semana Medica* (Buenos Aires), No. 47, 1922, and No. 1, 1923.

# New Books

Reviews of the Latest Contributions to Technical, Industrial and Commercial Literature of Particular Interest to Members of the Electrical Industry

## La Navigation Fluviale et les Forces Hydrauliques en Suisse

By Dr. Victor Jaunin. Lausanne: Giesser & Held. 322 pages, maps and many illustrations.

## State Power Plants in Sweden

Published by the Royal Board of Waterfalls in Sweden. Upsala: Almquist & Wiksells. 170 pp., with maps and many illustrations.

These two volumes have much in common. They are both complete records of the vast hydro-electric developments which are being carried on in Switzerland and in Sweden respectively. Both countries, being without coal deposits of any size, established many years ago special boards to investigate and control all their water powers, a task which in Sweden became so large that in 1913 a number of subsidiary administrations had to be created to handle effectively the vast amount of engineering work involved.

Switzerland for its part is not only harnessing on a large scale its plentiful water powers, but is establishing at the same time a national canal system, permitting navigation and cheap transportation within its own boundaries and with its neighbors, France, Italy, Austria and Germany, a complete connection between the rivers Rhone and Rhine being the ultimate goal. The available waterpower energy of Switzerland has been estimated at roughly 3,000,000 hp. Of this 840,000 hp. is now utilized in 835 large central stations and 38,000 hp. in 6,025 small stations. An interesting part of the book is the detailed description of a number of the largest Swiss hydro-electric stations. To be sure, nearly all of these plants are so large and contain so many important and modern features that descriptions of them have already appeared in the technical press. Details of some of the plants with very high head, such as, for example, the Ritom station with a hydraulic head of over 2,600 ft., are of especial note.

The book on the Swedish power plants is of a much more technical character and written especially for the designer of station layouts, going down to the minutest detail. Sectional drawings form therefore a large portion of the illustrations. The volume contains a complete description of the large hydro-electric plants at Trollhättan (115,000 kw., 50 kv.), Porjus (58,500 kw., 80 kv.), Alvkarleby (61,250 kw., 70 kv.) and Motala (30,000 kw., 70 kv.), as well as of the Västeras steam plant (38,000 kw., 120 kv.).

A 220,000-volt, three-phase, 50-cycle trunk-line system, covering the lower half of Sweden, will be completed by the end of 1935. A number of transmission lines, operating now at 120,000 volts, are built with sufficient clearances to permit an increase to 220,000 volts in the future. Some of these Swedish plants show great originality in their design. For example, the entire power house of the Porjus station is subterranean, blasted and hewn into solid bedrock. Another instance is the side wall of the Alvkarleby station, which forms the retaining wall of the upstream canal.

A. PALME.

## Machinery Foundations and Erection

By Terrell Croft. New York: McGraw-Hill Book Company, Inc. 685 pages, illustrated.

A practical book on machinery foundations has long been needed, and the one under notice is the result of several years' work on the subject by the author. Material has been collected from many sources on all the problems and methods of building, designing or changing foundations and has been studied and presented in a logical, clear and useful form for those engineers who lack the time or training to study the usually difficult mathematical treatises on the subject. The author has written a workable book for all kinds of engineers which is certain to be used as a field guide in construction work.

In one division of the book he gives the fundamental formulas relating to foundations, in a second section he discusses the foundation accessory equipment and detail parts, while still another portion of the book takes up the complete foundations for specific machinery. Methods employed for erecting machinery after the foundations are built are clearly stated in the last part of the book. Interspersed throughout are problems which treat of the text matter. Mr. Croft has used pictures to convey major ideas. This volume keeps up the standard of his other works in excellency of make-up, clearness of expression and good illustrations.

## L'Union d'Electricité et la Centrale de Gennevilliers

By Ernest Mercier, general manager of the Union d'Electricité. Paris: Revue Industrielle.

This pamphlet, of which an English edition will be issued shortly, is devoted especially to the superpower plant at Gennevilliers, near Paris, which was covered in a leading article in the issue of the ELECTRICAL WORLD for July 29, 1922. An account is given of the formation of the present company, which was organized within the past few years by the aggregation of a number of small electric lighting and power companies. An account of the program of the present company and the way in which it is being carried on is also given. There are numerous details of the Gennevilliers plant, elaborately illustrated, and there is some information regarding other power plants owned by the company. This pamphlet is the one referred to in the footnote printed in connection with the ELECTRICAL WORLD article mentioned.

## Corso Teorico-Pratico di Elettrotecnica

By Prof. Luigi Lombardi. Milan: Casa Editrice Dottore Francesco Vallardi. Third edition. Two volumes, 1,411 pages, illustrated.

In no clearer way than in these volumes can problems concerning the theory and construction of electrical machinery and their different applications be analyzed and presented to young students. Professor Lombardi rightly avoids that dry form in which a textbook so often appears and presents his subject matter interestingly, discussing it in an exhaustive way which makes the treatise more worth the consideration of professionals as well as students. The latter with the aid of this book will undoubtedly become acquainted not only with the theoretical solution of numerous electrical problems but also with the application of theories to practical cases.

In the first volume the author, in dealing with the production of electrical energy and after explaining the theoretical side of machinery construction at length, passes in review and discusses in detail different practices followed by the most important European and American manufacturers and the resultant characteristics of their products. In the other volume transformation, distribution and the use of electrical energy are presented and illustrated in the same clear, thorough form. While the theories of the science could not be better explained and while American scientists receive their just share of credit for what has been done on this side of the Atlantic, we feel that in the discussion of the different practices and methods of construction of electrical apparatus the American manufacturer does not receive, especially in regard to motor and generator construction, the degree of credit that he deserves. Perhaps the difficulty of obtaining data from him, first-hand, accounts for this. Nevertheless, the book has remarkable merit and is worth keeping in any library.

PHILIP TORCHIO.

## New Use for Carrier Radio

**Trouble Reports Are Telephoned Over Feeder and Trolley Wires in New York City**

THE Third Avenue Railway Company, in conjunction with the General Electric Company, has completed a series of experiments in New York City in which radio carrier currents are used on the feeders and trolley wires of its overhead-trolley system as a means of communication between points on the system. Transmitters and receivers similar in many respects to those used in radio broadcasting have been employed, and satisfactory communication has been established between substations and dispatchers' offices and trolley cars.

At a special demonstration of this means of communication held on Monday of this week a surface car carrying the radio equipment ran up and down the St. Ann's Avenue line, about a mile and a half in length, in which distance the operators communicated at will with the Brook Avenue substation. This car was in charge of Walter J. Quinn, electrical engineer of the railway company, and Edward Austin, engineer of the General Electric Company.

### What Has Been Accomplished

Discussing what has been accomplished toward more rapid means of communication between points on the line in surface operation, Mr. Quinn said:

"The wires and feeders form a network covering the entire system which furnishes ready means of contact with all strategic points and also the means by which emergency motor vehicles may instantly make contact and be placed in communication with the central dispatching point. We have found that by a suitable modification of the conventional radio transmitting system the output of the transmitting station in the form of high-frequency carrier currents is modulated by the voice through suitable amplifier and modulator tubes."

Mr. Quinn explained that at the receiving point, which may be at any place on the network, a radio receiving set may be coupled to the trolley wire, which permits the listener to receive the communication by the use of ordinary telephone receivers. Both at the point of origin of the message and at the receiving point facilities may be provided for two-way conversation; that is, each operator may talk as well as listen. Simultaneous transmission and reception is possible without the use of switches alternately connecting the transmitter and receiver to the trolley wire.

No interference, he said, will be caused to the users of short-wave broadcasting receivers by the presence of carrier currents on the trolley system, owing to the long wave lengths employed in the carrier-current system and to the fact that the long-wave carrier currents are guided by the trolley wires and there is no appreciable radiation from them.

## Business Conditions Improve

**Heads of the N. E. L. A. Geographic Sections Report on General Conditions Throughout the Country, Particularly with Reference to Electric Light and Power Industry**

GENERAL business conditions, and particularly those in the electric light and power industry, are showing steady improvement according to statements of representatives of all the geographic divisions in attendance at the national executive committee meeting of the National Electric Light Association held in Chicago, March 23. It was also reported that although much radical legislation aimed at public utilities has been introduced in the legislatures, comparatively little of this class of legislation will be enacted into laws, many state legislatures having adjourned without any action whatsoever, thus indicating a trend of public opinion toward sane and fair treatment of utilities.

A very perceptible swing toward more widespread customer ownership of stocks and bonds of public utilities is manifested throughout the country, and this, it is thought, has had much to do with increasing public confidence and support for the electric light and power industry.

The business of individual companies during 1922 showed a very healthy increase, as was indicated in the annual dues of the association, which have increased approximately 12 per cent, and the feeling of the principal companies toward the national organization is indicated by the fact that no resignations have been recorded.

### Convention Plans

Drafts of reports by the four national sections and by the national committees were submitted in brief and approved for presentation before the convention to be held in New York next June. The general convention plans were discussed and committees were authorized to proceed with detailed arrangements for the several sessions. Among the chief reports submitted was one by E. W. Lloyd, chairman of the Joint Committee for Business Development, who spoke of the co-operative work being done by that committee. The committee is now energetically at work, many of the misapprehensions and misunderstandings regarding its activities having been cleared up. It is Mr. Lloyd's expectation that the joint committee will make an admirable presentation of its plans and a report of its various activities at the convention in June.

The committee on relations with the educational institutions is working out details for a national program whereby it is hoped that lectures and courses on public utility subjects will become a part of the curricula of the leading universities and colleges of the country.

## Public Relations Meetings

**Executive Committee of N. E. L. A. Section Plans for Advertising and Publicity**

AT THE meeting of the executive committee of the Public Relations National Section of the National Electric Light Association held in Chicago on March 22 the reports presented indicated that marked progress had been made in the activities of the section. Definite advertising and publicity plans were outlined and approved, and the preparation and production of a third motion-picture film was indorsed and was approved on the following day by the executive committee of the parent association.

Announcement was made that the Public Relations National Section will hold three afternoon sessions during the convention next June. The first of these will be devoted to general business and the presentation of reports of committees. At the second session the work of state committees and general advertising and publicity topics will be discussed, while at the third session there will be a symposium of public relations activities presented by five state commissioners and five leading executives of the industry.

## New York Water-Power Bill

**Provisions of Measure Introduced to Carry Out Governor Smith's Recommendations**

A BILL introduced into the New York State Legislature on March 22 to carry out the recommendations made by Governor Smith in his special message on water-power development makes an appropriation of $1,000,000, to be immediately available, but contains no indication of and puts no limitation upon ultimate cost. The bill is confined to development on the Niagara and St. Lawrence Rivers and is therefore necessarily conditional on the outcome of the pending litigation between New York State and the Federal Power Board.

Elaborate machinery is set up by the bill. A bureau is established to be headed by the State Engineer and Surveyor, acting as Commissioner of Hydro-Electric Power. Sites on which no work has been begun may be condemned, development may be undertaken by the state on these sites or on sites owned by it, and transmission lines may be constructed by the state. All existing transmission lines are declared common carriers and put under the control of the bureau. Municipalities receiving power may compel its transmission over privately owned lines or may build their own transmission system. No provision is contained to oblige a municipality to obtain a certificate of convenience and necessity from the Public Service Commission before engaging in this business, nor is there any clause for compensation of private companies whose business may be injured or for referendum to the voters of a municipality of the issue of state or private service. Rates are to be controlled by the Commissioner of Hydro-Electric Power.

OTHER BILLS OF ELECTRICAL INTEREST

Among other bills introduced into the Senate at Albany are one to limit to 15 cents per lineal foot the cost of laying service pipes or wires of an electric light corporation connecting main line with meter in building or premises; one authorizing New York City to construct electric power houses at city-owned reservoirs in the Croton and Catskill watersheds, build a transmission system and dispose of the energy generated, and one providing for laying of wires and conduits for electric light and telephone service under private roads or streets on which owner has right of access to or egress from property.

In the Assembly a bill has been introduced requiring the electrification of all steam railroads in New York City.

## Pinchot's Power Bills In

Bills designed to carry out Governor Pinchot's plans for power development in Pennsylvania were introduced in the lower house at Harrisburg on Wednesday. One bill provides for a "giant power survey board" and carries an appropriation of $35,000 for the work. Another creates a commission to negotiate with New York and New Jersey for regulation of the Delaware River and utilization of the river for power. Other bills give the Water Supply Commission and Forestry Department added authority to facilitate the early development of electric power throughout the state.

## Joint Fuel Committee Closes Washington Office

Announcement is made by Chairman John W. Lieb of the joint fuel committee representing the national electric light and power, electric railway and gas associations that the Washington office of the committee, which has been in charge of Col. John Price Jackson, will be closed Saturday, March 31. This action has been determined upon because of the general improvement of the fuel situation, although there are isolated instances in which assistance will continue to be needed. Any member companies having difficulty in obtaining fuel supplies are advised to correspond directly with N. E. L. A. headquarters in New York after April 1.

## Big Advertising Program for N. E. L. A. Convention

Letters have been sent to all manufacturer members of the National Electric Light Association announcing that the exhibition committee, Frank H. Gale chairman, has determined that it will not be feasible to hold an exhibition in connection with the convention of the association in New York City next June. The manufacturer members, however, have been requested to co-operate in a huge advertising and publicity program during the week of the convention for the purpose of stimulating interest in electrical devices and electrical service generally. In this connection they have been requested to urge their dealer representatives in New York City to make special show-window displays during convention week, to urge dealers to give particular attention to newspaper advertising space and to arrange special exhibits.

# Recommendations of Radio Conference

**Department of Commerce Is Asked to Enlarge Both the Broadcasting and the Amateur Fields by Opening Up and Readjusting Wave Bands**

THE second national radio conference, whose deliberations at Washington last week were reported by the ELECTRICAL WORLD (page 708), has announced its recommendations to the Secretary of Commerce. It finds that the interference experienced by broadcasters and listeners can be relieved by the opening up of a new wide band of waves by the government and a new assignment of individual wave lengths to broadcasting stations. This can be made possible by the opening up of what were previously government reserved waves and the shifting of certain ship waves out of the broadcasting wave bands. The Department of Commerce, acting under its present authority, will be able to establish and enforce the new regulations and thus bring order in the radio world.

Boiled down, the important recommendations of the conference are these:

Previously all broadcasting was concentrated on three wave lengths, 360, 400 and 485 m. Now a new field extending from 222 m. to 545 m. can be created for the purpose. Within that field individual wave lengths can be assigned to stations and be divided into two classes. The higher-power class A stations, corresponding to the present class B stations, can use the wave lengths between 288 m. and 545 m., while lower-powered stations (new class B stations) can use the waves from 222 m. to 286 m. This will enable the higher-power stations distributed in fifty localities and powerful enough to cover the United States to be within the reach of every listener. Suitable wave lengths are provided in the recommendations for the existing lower-power stations, numbering more than five hundred.

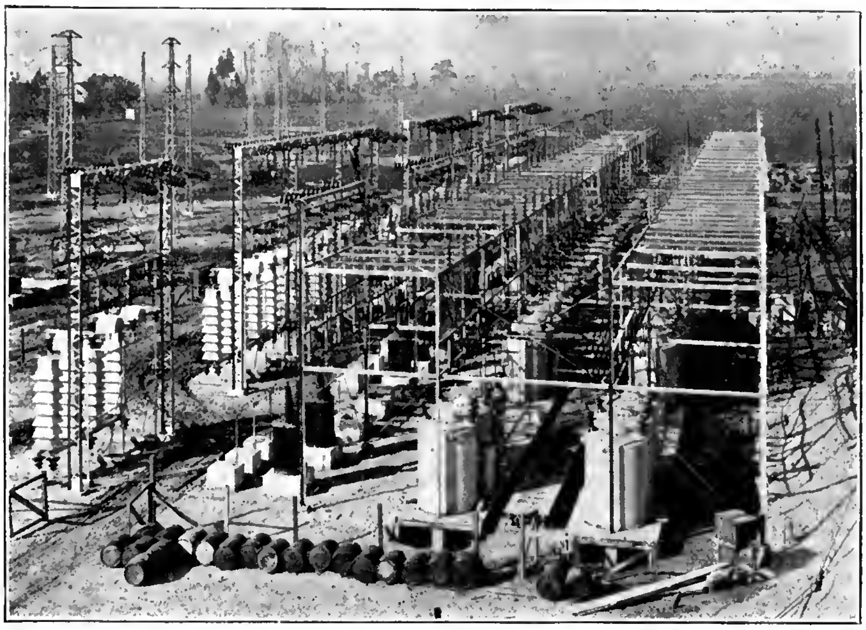
The report urges that the field of amateur activity be extended by allotting a band extending from 150 m. to 222 m. in place of the waves up to 200 m. now used. The band from 200 m. to 222 m. can be reserved for high-grade continuous-wave telegraph transmitting stations operating under special license. Technical and training school licenses can also occupy this band. The report confines spark amateur radio-telegraph stations to the band measuring 175 m. to 200 m. Ships using 450-m. waves should keep silent between 7 and 11 p. m. and as soon as possible readjust their equipment for transmission on wave lengths above 600 m. Another recommendation is that simultaneous rebroadcasting be permitted as a service only on a broadcasting wave length and with the authorization of the original broadcaster and of the Department of Commerce.

The new regulations recommended are based on a plan submitted by the radio inspectors of the Department of Commerce and include elements from other plans submitted by the Radio Section of the Associated Manufacturers of Electrical Supplies, the National Radio Chamber of Commerce, the Institute of Radio Engineers, the American newspaper broadcasting stations and several other groups of those concerned with radio.

## Laguna Bell Substation

### Rapid Progress on Southern California Edison Structure for Transforming 220,000-Volt Energy

THE 60,000-volt bus at the new Laguna Bell substation of the Southern California Edison Company has just been placed in operation and the 220,000-volt equipment is rapidly being placed. This substation is a short distance southwest of the city of Los Angeles, and it will constitute another terminus similar to Eagle Rock and a very important switching station on the 60,000-volt Edison system. After the Big Creek lines are changed over to 220,200-volt operation it will be the means of utilizing 220,000-volt power at a point very close to the load center of a rapidly growing industrial section of Los Angeles and southern California.



THIRTEEN 60,000-VOLT LINES WILL RADIATE FROM THE NEW LAGUNA BELL SUBSTATION

The main Big Creek transmission line will be tapped a few miles before it terminates at Eagle Rock substation, and two 30-mile, 220,000-volt steel-tower lines will skirt the city of Los Angeles' to Laguna Bell. Double-bus construction will be provided on the 220,000-volt, 60,000-volt and 15,000-volt buses to provide maximum continuity of service. Iron pipes mounted on pillar insulators with no overhead steel construction will be used for the 220,000-volt buses. The 220,000-volt switches will have an interrupting capacity of about 2,000 amp. at 220,000 volts. A bank of transformers consisting of three 20,000-kva. units will be used to step down from 220,000 volts to 60,000 volts at present, although ultimately two such banks will be used. A concrete building is being erected which will house a 30,000-kva. synchronous condenser. This condenser will be used for line regulation and power-factor control and will be tapped off the 60,000-volt bus. Wherever possible outgoing 60,000-volt lines will utilize balanced relays as protective equipment so that a defective transmission line will be quickly isolated. Each of the outgoing 60,000-volt lines will also be provided with oxide-film outdoor-type lightning arresters.

The 60,000-volt circuit breakers are interesting owing to their size and the fact that they are of the multi-break type where a number of breaks in series are utilized to break the arc when the switches are opened under short circuit. Extreme care and much thought have been given to the designing of an adequate system of grounding for the neutrals of the 220,000-volt transformers and for the station grounds. Drilled wells will constitute part of this grounding plan. Approximately 27 acres of land have been purchased, and the greater part of this will be utilized in the ultimate outdoor station construction. The cost of the present program is more than $1,000,000. It is expected that the installation of the 220,000-volt equipment will be completed and the station ready for operation by the early summer.

## Odd Public Service Situation in Superior

An unusual situation prevails in Superior, Wis., which has been served by the Superior Water, Light & Power Company. The citizens voted recently to purchase the three public service plants of the company—electric, gas and water—and the Wisconsin Railroad Commission has already ordered the transfer of the two plants first named and set a price. The city, however, has not issued bonds to cover the acquisition, and it is held that it is too near its debt limit to be able to do so. On the other hand, the contention is made that the public utility company can, if it wishes, mandamus the city to fulfill the bargain and that the city will then have to dig up the price in some manner. This the company has evinced no desire to do.

Newspaper correspondents after consultation with the authorities at Madison state positively that the city owns the plants, but the attorney for the company states unequivocally that the city does not own them. The special attorney for the city wants more information before venturing an opinion.

## Georgia Railway & Power Boosts State

More than two hundred representative citizens of north Georgia, including Mayor Sims of Atlanta, Governor-elect Walker and others, attended a dinner given by the Georgia Railway & Power Company on March 17 for the frankly stated purpose of arousing interest in the utilization of electric power to build up the resources of the state. Preston S. Arkwright, president of the company, said:

"North Georgia's wonderful resources must be turned into manufactured products. Somebody else has always reaped the profit on the manufacture of raw materials raised in the South. Our resources must be utilized at home, our manufacturing must be done at home, if we are to make the profits that we should from our products. Regardless of all factors entering into the cost of power, our company is prepared to furnish electricity to all of the communities it serves at one and the same price, its single motive being the development of these communities to their highest productive power."

Resolutions were adopted providing for the formation of an association to be known as "Georgians, Inc." Its object will be to connect the different communities served by the water-power resources of the Georgia Railway & Power Company and to strive in every possible way to advertise the resources and manufacturing possibilities of that section of the state.

## Mitchell Dam Plant Goes Into Service

Service from the Alabama Power Company's plant at Mitchell Dam, on the Coosa River, began on Monday last, when the water began to flow through the giant wheel. The new power source is expected to relieve the company to some extent of the need to generate steam power during the season of high water. Fifty-two per cent of the company's power in 1922 was steam-generated. During the period of low flow in the Coosa, however, the plants at Lock 12 and Mitchell Dam will drop from their maximum capacities of 110,000 hp. and 120,000 hp. respectively to 30,000 hp. and 40,000 hp. each, necessitating the operation of the company's Gadsden and Gorgas steam plants and the Sheffield plant leased from the government. All the power which will be generated was contracted for before the first yard of concrete was poured, officials announced.

## Pittsburgh Makes Plans

**Local Men Getting Ready for April Session of A. I. E. E.—Program Tentatively Arranged**

A ROYAL welcome and a fine program will be ready for the visiting members of the American Institute of Electrical Engineers at the national convention in Pittsburgh on April 24-26. The local convention committee has been very active in its preparations and has made the most of the opportunities for entertainment and education in the Pittsburgh industrial district.

The keynote of the convention will be the operation, protection and control of transmission and distribution systems. The protective-devices committee has assembled operating data and experiences on grounded and ungrounded systems and has obtained authoritative papers on relays, reactors and accessory apparatus. In the light of field experience a decision should be reached on many heretofore debatable practices.

In addition to this program a group of papers on electric furnace design and operation will be presented and also several papers on a diversity of subjects. The program should prove particularly attractive to engineers in central-station organizations and in industrial plants.

### WESTINGHOUSE PLANT VISIT

One of the features of the convention will be a visit on April 26 to the works of the Westinghouse company. The members will inspect the works in small groups and opportunity will be given to visit the broadcasting station KDKA and the studio. A special feature of the trip will be a demonstration of lightning-arrester tests, with the application of the oscillograph to picture the phenomena in detail. In the evening the visitors will be the guests of the Westinghouse company at a dinner and cabaret entertainment.

Headquarters during the convention will be at the William Penn Hotel, where arrangements have been made for convention buffet lunches. A banquet will be held at the hotel on Wednesday at 6:30 p.m., when speakers of national prominence will discuss topics of vital interest to the engineering profession.

On Friday arrangements have been made to visit points of interest in the Pittsburgh district. The power stations, transmission lines, substations and distribution systems of the Duquesne Light Company and West Penn Power Company have many interesting features, and in addition the Pittsburgh district affords opportunity for visits to steel mills, glass works, coal mines, insulator works and many industrial plants, including that of the H. J. Heinze Company.

An outline of the tentative program follows:

TUESDAY, APRIL 24

*Morning.*—Registration and committee meetings.

*Afternoon.*—"The Neutral Grounding Reactor," W. W. Lewis; "Experience with Peterson Coil," J. M. Oliver and W. W. Eberhardt; "Economical Value of Resistance in the Grounded (Neutral," H. H. Dewey; "Grounding on Step-up Transmission Systems," P. H. Chase; "Grounding on Generator Voltage Transmission Systems," E. C. Stone.

*Evening.* — "Surges on Transmission Lines," J. Slepian and J. F. Peters; "Third-Class Conductors and Mechanism of the Arcing Ground," Dr. C. P. Steinmetz.

WEDNESDAY, APRIL 25

*Morning.*—"Some Problems in Electric Furnace Operation," F. V. Andrae; "Electric Furnaces," A. N. Anderson and B. D. Sakwallata; "Some Fuel Determinations on the Southern Pacific System," A. H. Babcock; "Heating a Cotton-Weave Shed by Electricity," C. T. Guilford, "Electric Furnace Design," F. Hodson.

*Afternoon.*—"Relay System of Duquesne Light Company," H. P. Sleeper; "Ground Selector Relay Scheme," P. Ackerman; "The Distance Relay for Automatically Sectionalizing Electrical Networks," L. N. Crichton; "Lighting and Control Equipment for Eastman Theater," Messrs. Jones and Mott.

*Evening.*—Banquet.

THURSDAY, APRIL 26

*Morning.*—"Survey of Lightning Disturbances," M. McLaren; "Experience with Reactors," N. L. Pollard; "Short-Circuit Forces on Reactor Supports," R. E. Doherty and F. E. Kierstead; report of sub-committee on proposed insulator tests and specifications.

## Middle Western N. E. L. A. Transportation Plans

Arrangements for two special trains from Chicago for the delegates to the June N. E. L. A. convention at New York have been made by Godfrey H. Atkin, master of transportation. These trains will leave Chicago at 10:30 a.m., Sunday, June 3. One train, known as the "Blue Special," will run over the New York Central Railroad, and the other, the "Red Special," will run over the Pennsylvania lines. Special Pullmans from Denver, Minneapolis and Kansas City will be attached to the "Red Special," and special sleepers from Detroit and Cleveland will be attached to the "Blue Special." A rate of one and one-half fares for the round trip has been granted to all delegates. This rate will apply to all parts of the country.

Further information can be obtained from the following assistant masters of transportation: Clarence L. Law, New York Edison Company; H. K. Mohr, Philadelphia Electric Company; Charles B. Burleigh, General Electric Company, Boston; Frank Gale, General Electric Company, Schenectady, N. Y.; J. C. McQuiston, Westinghouse Electric & Manufacturing Company, Pittsburgh; H. N. Sibbald, National Lamp Works, Cleveland; Herbert Silvester, Detroit Edison Company, Ann Arbor; W. E. Clement, New Orleans Public Service Company, New Orleans; Erick W. Smith, General Electric Company, St. Louis; A. E. Bettis, Kansas City Power & Light Company, Kansas City; H. E. Young, Northern States Power Company, Minneapolis; E. A. Phinney, Jefferson County Power & Light Company, Golden, Col.; W. H. Somers, Puget Sound Power & Light Company, Seattle; Earl Fisher, Pacific Gas & Electric Company, San Francisco, and K. E. Van Kuran, Westinghouse Electric & Manufacturing Company, Los Angeles. Mr. Atkin's address is 713 Marquette Building, Chicago.

## Erie Lighting Is Sold

**Becomes a Part of Penn Public Service Corporation, Operating Plants from the Lake to Maryland**

OFFICIAL announcement has been made that a controlling interest in the Erie Lighting Company of Erie, Pa., has been purchased by the Penn Public Service Corporation, which is extending its territory and will include steam and hydro-electric plants scattered from Erie on the northwest and Warren on the northeast south to the Clarion River and continuing through Jefferson, Indiana, Clearfield, Center, Cambria and Somerset Counties to the Maryland state line. Fred B. Hofft, vice-president of the Erie company, in announcing the merger said last week:

"The Penn Public Service Corporation now furnishes service to approximately fifty communities south of Forest County and has recently taken over the Warren properties. The service is furnished from a number of large interconnected power plants at the mouths of the coal mines, and in addition power will be received from the Clarion River hydro-electric system.

"The same interests that control the Penn Public Service Corporation also control the Clarion River Power Company, and power from this development will be taken by the Penn Public Service Corporation. The development of the hydro-electric power available at Clarion River is to be by means of three large dams and power plants, the first of which, located at Piney, is now under construction and will be in operation early in 1924.

### TOTAL CAPACITY OF 260,000 HP.

"The combined facilities of the three developments will provide a hydro-electric generating capacity of over 260,000 hp. In addition to this water power, the Penn Public Service Corporation has five large steam generating stations adjacent to the mouths of coal mines. The largest plant is at Seward, Pa., and was put into service in October, 1921.

"The Front Street station of the Erie Lighting Company will be enlarged and become one of the main generating stations in this transmission system by connecting through high-voltage transmission lines with the general system into which these large steam plants and the Clarion River hydro-electric development will feed."

## Billion-Dollar Capital for the A. T. & T.

On Tuesday of this week the proposal of the directors of the American Telephone & Telegraph Company to increase its capital stock from $750,000,000 to $1,000,000,000 was ratified at a special meeting of stockholders. This action puts the company at the head in point of financial size of all corporations in America, if not in the world. Its nearest rivals are the United States Steel Corporation and the Standard Oil Company of New Jersey.

## Fourteen Projects Halted

**Arizona's Failure to Ratify Colorado Pact Holds Up Many Plans Already Worked Out**

FAILURE to ratify the Colorado River compact is regarded by federal officials as a greater calamity to the West than is generally appreciated at present. The fourteen major projects which have been halted by the action of Arizona would, if allowed to proceed, contribute very importantly to the prosperity of the entire West. It happens that Arizona itself is affected adversely as much as, if not more than, any other single state. The only encouraging aspect of the situation is that the compact stands and can be ratified at any time in the future.

The Girand project at Diamond Creek involves the ultimate investment of $70,000,000. The initial investment would be two-thirds of that amount. This project, of which Arizona would be virtually the sole beneficiary, is delayed indefinitely along with the other thirteen projects.

Another of the large projects which is delayed is that of the Southern California Edison Company, which contemplated a series of undertakings, the most important of which was the great reservoir at Lee's Ferry. That company was prepared to begin preliminary investigation and work immediately on the ratification of the compact. In that instance the delay is likely to work against the best interests of the Colorado basin, since it is forcing the Southern California Edison Company to commit itself more and more to the development of higher-cost power on the headwaters of the San Joaquin. The Imperial Valley suffers from the fact that the development planned by the Southern California Edison Company would have done much to remove the flood menace on the lower river.

The Flaming Gorge project of the Utah Power & Light Company on Green River is another of the big projects halted by the failure to ratify. That company is ready to go ahead with its project, which would develop 100,000 hp. and create a storage of 1,500,000 acre-feet.

The plans of the Denver Gas & Electric Company for the development of power at Kremmling, on the Colorado, have been interfered with seriously. The Denver Gas & Electric Company had planned to store the annual run-off and to develop 60,000 hp.

Though the remaining projects on the river have not reached the same definite stage as those mentioned, it is probable that most of them would go through in the near future were the uncertainty in regard to the river removed.

## Flathead Lake Development Faces Long Delay

The project of the Rocky Mountain Power Company which involves the development of 270,000 hp. at the outlet of Flathead Lake bids fair to be tied up in much the same manner as the projects on the Colorado River. Officials of the State of Washington are urging that the Federal Power Commission take no action on the application of the Rocky Mountain Power Company until the survey of the Columbia Basin project, recently authorized by Congress, is complete and action has been taken by Congress on the report. Since the feasibility of the three-hundred-million-dollar Columbia Basin project is questioned seriously, it is apparent that a long period of years is certain to elapse before the point can be settled. It is almost apparent that the power project cannot afford to wait for its settlement.

In a brief received in support of the plea for delay made by the State of Washington it is claimed that the state has made a detailed study of the question extending over six years, whereas the federal engineers have made only a hasty examination. The state officials lay great stress on the findings of General Goethals. The commission authorized by Congress to study the project will consist of Francis M. Goodwin, the Assistant Secretary of the Interior, chairman, and Arthur P. Davis, Director of the Reclamation Service. Homer J. Galt of the Reclamation Service will be the engineer in charge of the field work. The investigation of the Umatilla Rapids project, in Oregon, will be conducted by a separate body.

# Badger State Men Discuss Vital Topics

**Electric Section of Utilities Association Considers Rural Lines, New State Electrical Code and Public-Relations Problems—Convention Draws 400 Delegates**

RURAL-LINE problems and the interpretation of the new State Electrical Code played a prominent part in the Electric Section meetings of the first joint convention of the Wisconsin Utilities Association, held at Milwaukee on March 22-23. R. G. Walter, Madison, chairman of the committee on rural lines, showed in his report that on thirty-two rural extensions studied the average power loss was 45.4 per cent with an average monthly consumption of 28.7 kw.-hr. Commenting on this fact, R. M. Howard, Winona, declared that the average power factor of 33.9 per cent checked the 30 per cent found in the Iowa tests. Since the report showed in one installation a time saving of thirty minutes, he calculated that this saving on a 20-cent hourly basis could be explained as the monthly rural service charge of $3.

C. R. Phenicie, Green Bay, chairman of the Electric Section, divided the farmer classes into two groups—those who were not willing to build their own private plants but were willing to pay a high rate for energy and those who preferred to sink their money in a private plant rather than pay a high rate for energy. Mr. Phenicie felt that here was an excellent opportunity for earnest publicity explaining the advantages of the service before the reasons were given for the extra service charges. The discussion following indicated that sales on appliances to farmers would be one means of increasing the energy consumed, which in turn would lower and eventually wipe out the rural-service charge. The problem of how to charge customers added after the line is built was held to be best handled by keeping the investment equal between the group members.

President J. P. Pulliam's address to the joint convention Thursday morning emphasized the absolute necessity of keeping the utility story before the public, especially because $25,000,000 will be spent this year by Wisconsin public service companies. Since a large portion of this will come direct from customers, he urged that more time be spent in presenting the industry's problems to the people of the state.

In considering a utility man's place in the community, Fred E. Schornstein, Eau Claire, insisted that unless such a man was at the heart of all community affairs he was not serving his community as he ought.

In the afternoon session of the Electric Section George E. Wagner, Madison, presented a review of the courses given at the University of Wisconsin to sixty-five metermen last January.

C. W. Place Chicago, then spoke on automatic stations and their applications. He considered them from the viewpoint of service improvement over manual control. With about 500 installations now operating or being constructed, Mr. Place asserted their value in giving good service far outweighed their cost. C. V. Seastone, Madison, stated that the installation of an automatic hydro-electric plant on Pine River had saved his company $7,000.

### Inductive Co-ordination

The round-table discussion on inductive co-ordination was led by L. N. Boisen, Chicago, and A. J. Goedjen, Milwaukee, who explained the third report of the joint general committee of the N. E. L. A. and the Bell System. Local supply lines can be placed upon joint poles when conditions are satisfactory, but long transmission lines on opposite sides of the road are preferable unless a large number of service-wire crossings are required, said the report.

The importance of "selling" the commercial department to the employees was emphasized by W. T. Bracken, Beloit, at the Sales Section meeting. Since service was a commodity as salable as other goods, he saw no reason why an effective sales department could not be built up as in other industries. Thomas Casey, Chicago, speaking on electrical merchandising, felt that the biggest factor was knowledge of the product itself.

On Friday morning there were two-minute reports on the year's activities of the various sections.

James P. Barnes, president Louisville Railway Company, maintained that one of the reasons why utilities had sometimes failed in trying to bring about good relations was failure to present their case in understandable language. Too often they spoke a technical jargon that was not comprehended. Mr. Barnes characterized publicity as a two-edged sword, which, powerful when under steady control, would turn ruthlessly upon its holder once this control was lost.

At the afternoon session a round-table discussion was held on the Wisconsin State Electrical Code. G. G. Post, Milwaukee, explained portions of the code affecting central stations by stating that the code's purpose was to improve service by requiring good construction. However, he felt that barriers for 7,500-volt oil circuit breakers were unnecessary on circuits carrying light loads.

The effect of the code on the fire insurance rates of electric utilities was considered by Frank R. Daniels, Milwaukee, who said that in 1921 Wisconsin had the lowest fire loss in the country. While he felt that the code did not cover all subjects as well as possible, he did consider barriers an important item in reducing fire losses.

Charles B. Hayden, Railroad Commission of Wisconsin, failed to see how a utility could legally lock a service entrance switch which is owned by a customer, but he saw no reason why a seal wouldn't work as well. The question of installing two grounds at the service entrance was answered by Mr. Hayden, who said that the neutral should be grounded to the cabinet and then a ground be run direct to the water pipe.

The value of painted numbers for poles versus aluminum markers was discussed by E. J. Kallevang, C. R. Phenicie and R. G. Walter. The uniformity of aluminum markers and their ease of placement were overbalanced, it was considered, by their causing a climbing hazard to linemen and by their inconspicuousness, which necessitated a pole checker's leaving the road to read numbers.

### New Officers

This convention drew an attendance of 400 delegates. The officers elected for the ensuing year are: President, Harold L. Geisse, Wisconsin Valley Electric Company, Wausau; vice-president, Bruno Rahn, Milwaukee Gas Light Company, Milwaukee; treasurer, G. C. Neff, Wisconsin Power, Light & Heat Company, Madison; executive secretary, John N. Cadby, Madison. For the Electric Section the officers are: Chairman, G. A. Mills, Wisconsin-Minnesota Light & Power Company, Eau Claire; vice-chairman, M. H. Frank. A constitutional amendment added two sections—a sales and an accounting section. This gives the association a total of five sections.

## Engineering Council to Investigate Coal Storage

Decision to undertake a nation-wide coal-storage investigation was reached by the executive board of the American Engineering Council of the Federated American Engineering Societies at its meeting in Cincinnati on March 23-24. General indorsement of the plan for government reorganization submitted to Congress with the approval of President Harding and his Cabinet and continuance of the committee on transportation, headed by Max Toltz of St. Paul, were other outstanding features of the meeting, which was called by President Mortimer E. Cooley the most successful since the federation was organized.

The personnel of the committee to conduct the coal inquiry, which is to be made unless there is objection from the constituent societies, will be announced later by President Cooley. Both the Coal Commission and the Department of Commerce look with favor upon the proposed survey. Each of these agencies is making studies of certain features of the coal industry, but neither agency will be in a position to give sufficient consideration to the engineering and economic phases of coal storage. The work of the three agencies can, the executive committee holds, be so coordinated as to avoid all duplication, confusion and conflict. The specific object of the survey is to determine the facts relating to the engineering, chemical and economic factors involved in storage at the mine and elsewhere.

The executive board voted to cooperate in the movement to bring about uniform safety legislation, to broaden the program of its reforestation committee, to study the question of constituting the American Engineering Council a clearing house on elimination of waste, to further American participation in the proposed world power conference in London in 1924, and to work with the National Safety Council in plans for conservation week. It was voted to hold the next meeting of the board in St. Paul on June 8-9.

## Ferguson Attacks Institutional Power Plants

Declaring that many thousands of dollars of the public money are wasted by permitting state institutions to generate their own electricity instead of purchasing it from central-station lines, Vice-president Samuel Ferguson of the Hartford (Conn.) Electric Light Company recently discussed the fundamental economies of utility service before the appropriations committee of the Connecticut Legislature. It was pointed out that seven of the major institutions of Connecticut were asking for $377,000 for revamping old power plants. Mr. Ferguson stated that no private corporation could afford to maintain these little "two-for-a-cent power houses" and that every industry in Hartford with one exception has for the sake of economy scrapped its private power plant and become a central-station customer. In reply to an inquiry by Chairman Rogers of the committee whether the institutions were not utilizing steam in connection with heating in their power production, Mr. Ferguson said that the maximum demands for heating and for illumination are about fourteen hours apart.

## Middle West Utilities Has Prosperous Year

Along with its annual report showing combined surplus earnings for the year of $1,500,077, the Middle West Utilities Company has published photographs and tabulations of its holdings in 633 communities in fifteen states of the Union that give a comprehensive idea of the company's rapid growth. The gross earnings for the year 1922 totaled $29,870,702. After deducting operating expenses, interest on bonded indebtedness and other fixed charges, total earnings accruing to the company were $4,048,438. The gross earnings of the subsidiary companies were greater by $3,522,458 than for the year 1921. Of this increase $1,336,278 was contributed by new properties and the remainder came from the properties that were included in the 1921 report. A most remarkable showing is in the progress the company has made toward the distribution of securities, as shown by the number of stockholders, which stood at 6,063 in 1918, 6,902 in 1919, 10,491 in 1920, 23,621 in 1921 and 40,032 at the end of 1922.

## San Francisco to Have Testing Laboratory

A Pacific Coast testing laboratory similar to those already established in New York and Chicago will be opened in San Francisco about April 1 by the Underwriters' Laboratories, Inc., according to an announcement made by A. R. Small, vice-president of the organization at a recent meeting of the San Francisco Electrical Development League. The visit made by Mr. Small to the Pacific Coast, together with the announcement of the establishment of the Pacific Coast Laboratory, marks the culmination of a movement that had its inception previous to the world war. So important has the electrical industry become on the Pacific Coast that it was felt even then that Western manufacturers who desired to have their products passed by the Underwriters' Laboratories should not be compelled to undergo the expense and time involved in sending specimens to Chicago.

The laboratory will be installed at 615 Commercial Street. It will contain the latest equipment for testing electrical devices, appliances and materials and will be on a par with the New York establishment. R. J. Larrabee, resident electrical engineer for the Underwriters' Laboratories, will be in charge of the staff of experts to be employed. Charles Lum will act as district agent for the organization, with headquarters in San Francisco.

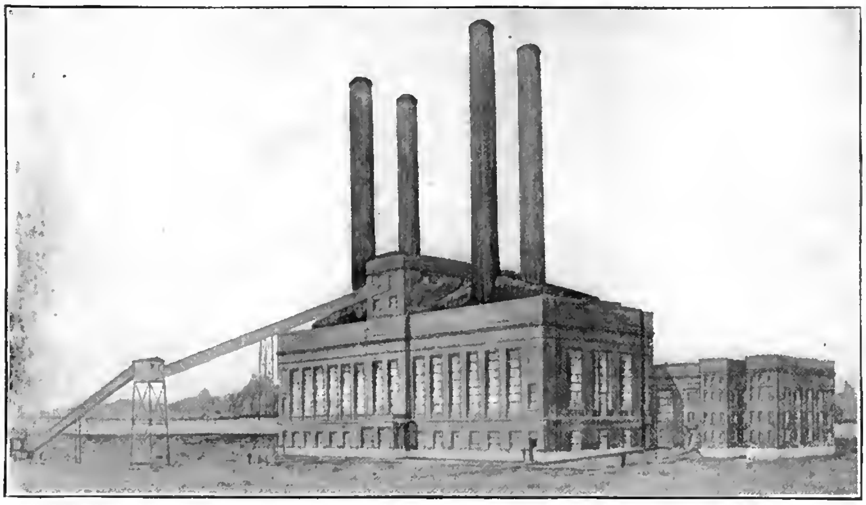
## Governor of Tennessee for Abolishing Commission

Asserting that the Tennessee Railroad and Public Utilities Commission as set up in 1919 has failed to please the people of the state and that there is an overwhelming public sentiment against it in the large cities, Governor Austin Peay of Tennessee has called on the Legislature to abolish the commission, saying last week in an official message:

"It is my own judgment that you should repeal the act of 1919 creating the utilities commission in this state without delay. I think you should not substitute any involved machinery for local regulation to which blame might be laid by the people if they become dissatisfied with the repeal of the present act, in event unexpected consequences result and they do not obtain the expected relief from such repeal. A simple statute should follow conferring power upon all municipalities to contract with their utilities both for public and private rates and service and such power as may be necessary to relieve orders which have been imposed on them by the State Commissioners since the act of 1919; such action reviewing increased charges through such orders, of course, to be subject to review in the courts to prevent any unreasonable or confiscatory action."

Governor Peay admits that among the smaller municipalities there is a sentiment for continuing the commission with some alteration of its powers and functions. Proposed changes in the law were stated in the ELECTRICAL WORLD in the issue for March 17, page 650.

## Wabash River Station, Indiana Electric Corporation



As already announced in the ELECTRICAL WORLD, Stone & Webster are to build this power house at Maxville, Ind., on the Wabash River, not far from Terre Haute and in the heart of the Indiana coal fields. It will have an initial rating of 40,000 kw. and an ultimate capacity of 100,000 kw. It will be connected with Indianapolis, 75 miles distant, by 133,000-volt, two-circuit, steel-tower lines and will be a very important unit in the system of the Central Indiana Power Company, serving seventy Indiana cities.

The two 20,000-kw. Westinghouse generating units to be first installed will be three-phase, operating at 60 cycles and 13,200 volts, and they will work under 300 lb. steam pressure, 650 deg. total temperature and 29 inches vacuum. Each of these turbines will be served by a 40,000-sq.ft. Westinghouse radial-flow, two-compartment surface condenser that is rigidly connected to the turbine exhaust and supported by springs. Circulating water to each condenser will be supplied by two 20,000-gal.-per-minute motor-driven circulating pumps. Two condensate pumps will be supplied for each condenser, one of which will be a spare. The air-removal apparatus will consist of Westinghouse two-stage air ejectors with surface intermediate and after condensers. There will be three air-ejector units, one of which is to be used as a common spare for the two condensers.

The entire feed-water heating will be accomplished by the use of a closed primary and secondary heater receiving steam bled from the main turbines. The approximate temperature of the condensate leaving the low-pressure heater will be 150 deg., and the final temperature from the high-pressure heater will be 208 deg. Evaporators will be used for purifying the make-up water.

A 2,000-kw., three-phase, 60-cycle, 2,300-volt non-condensing house turbogenerator will float on the line as a synchronous motor, the steam end running idly under a partial vacuum, which will be made by a small connection to the main condensers. The governor mechanism will be so designed that on any small reduction in the speed of the synchronous motor, caused by a reduced voltage or a complete loss of power on the main bus line, the steam end of the house turbine will immediately take the load and furnish the necessary auxiliary power. Excitation will be taken from directly connected exciters on each main turbine, and in addition a 150 kw. dual-drive exciter set will be installed.

## Brief News Notes

**Better Industrial Lighting Sought in Colorado.**—A bill is now before the Legislature of Colorado to bring about better lighting in industrial plants. It is patterned after the Oregon law.

**University of Michigan's Meter Course.**—An electric meter course will be held in the University of Michigan, Ann Arbor, during the week beginning April 9. On the opening day W. L. Wadsworth of Minneapolis, chairman of the meter committee of the National Electric Light Association, will address the students.

**The Supreme Court Ben Avon Decision.**—A noteworthy pamphlet on this important judicial utterance has been brought out for distribution by H. C. Hopson of 61 Broadway, New York City. It contains the series of decisions in this case covering questions of utility valuation and fair return, together with a "foreword" setting forth the salient points involved.

**Neola, Iowa, Splits Almost Even on Retaining Municipal Plant.** — Neola, Iowa, has decided by a majority of twenty-nine to retain its municipal electric lighting system, 241 voters being for it and 212 against. Just before the election the Town Council lowered the lighting rates to meet those of the Iowa Service Company, which had been seeking to purchase the plant.

**Cold Weather Interferes with Newfoundland's Power.**—Five feet of ice on the interior lakes of Newfoundland this month caused serious interruption in the supply of electricity generated on these lakes and carried to St. Johns, the capital of the island. Street cars were unable to run, factories shut down, newspapers had to suspend issue and the city lighting system was threatened.

**Construction Work on St. Paul Station Begun.**—Preliminary construction work on the new 100,000-hp. generating plant at St. Paul has been started. This plant will be known as the High Bridge station, the site being a 50-acre tract on the Mississippi River at High Bridge. A large warehouse and a storeroom 350 ft. long have been built. Two railroad trestles are being rushed to completion before the frost is out of the ground.

**Undeveloped Power Sites in Nova Scotia.**—The Nova Scotia Power Commission estimates the water power available in sites actually known and investigated at 300,000 hp. Exploitation of these sites has so far reached a total of only 47,000 hp., or about 16 per cent of the possible development. There is a total of 260,000 hp. in sites

of more than 1,000 hp. capacity, all of which are regarded by the Power Commission as of practical commercial importance.

**Kansas City Power Securities Corporation.**—This company, which owns all the common stock of the Kansas City Power & Light Company, reports for the twelve months ended Dec. 31, 1922, gross earnings of $7,864,817, an increase of $1,054,080 over the preceding year, and, net earnings of $3,683,268, an increase of $643,539. After the deduction of interest and amortization charges and dividends on preferred stock there remained $2,045,077 for depreciation and common-stock dividends, an increase of $484,408.

**General Gas & Electric Corporation to Build Plants at Easton and Middleton, Pa.**—Proceeds from the sale of 10,000 shares of General Gas & Electric Corporation cumulative participating preferred stock, soon to be placed on the market, will be used to expand that company's properties in Pennsylvania, according to announcement by W. S. Barstow, president of the corporation. The company will use a large part of the proceeds to construct two steam generating plants, one on the Delaware River near Easton, Pa., and the other on the Susquehanna at Middleton, Pa.

**St. Louis "Muny" Theater to Have Sound-Amplifying Devices.**—Electrical equipment designed to render speech and singing on the stage audible to persons occupying seats in the furthermost parts of the auditorium will be installed at the St. Louis Open-Air Municipal Theater. This equipment will include a Bell loud speaker and an amplifier. The theater, which is in Forest Park, has a depth of 256 ft. and is 225 ft. wide. The difference in elevation between the orchestra pit and the furthest row of seats is 53 ft. The seating capacity is approximately 10,000.

**Five New England States Interconnected.**—Additional transmission line construction is contemplated by the New England Power Company to interconnect its system with the Hudson River Power Company by a 66,000-volt extension from the Adams-Pittsfield (Mass.) district into eastern New York State. When this is done, with the completion of a tie line now under way between Hartford, Conn., and Agawam, Mass., every New England state except Maine will be interconnected, with lines extending into New York on the west and running to the Atlantic seaboard on the east.

**Project for Cacapon River.**—A declaration of intention filed with the Federal Power Commission by the Cacapon Electric Company of Martinsburg, W. Va., reveals plans for a large development on the Cacapon River at Edes Fort, in Morgan County, W. Va. The Cacapon is a tributary of the Potomac and was relied upon by Major Max Tyler, in his report on the development of the Great Falls of the Potomac, as one of the large reservoir sites to regulate the flow at Great Falls. The proposed development at Edes Fort includes a dam 170 ft. high and the storage of 6,000,000,000 cu. ft., to be drawn upon in the development of 27,000 hp.

**Gifts for Cape Town Electrical Laboratory Solicited.** — Prof. N. C. Woodfin, lecturer in electrotechnics at the Cape Technical College, Cape Town, South Africa, is endeavoring to supplement the electrical laboratory equipment at that institution by gifts from manufacturers of apparatus rated at from about 0.5 kw. up to about 5 kw., such as series dynamos, rotary converters, transformers, frequency indicators, rheostats or circuit breakers. American manufacturers who are willing to supply such apparatus will, he thinks, receive a splendid advertisement from the permanent exhibit that its installation in the laboratory would bring.

**Maine Utilities Consolidate.** — The York County Power Company and the Westbrook Electric Company, which have been controlled by the Cumberland County Power & Light Company, Portland, Me., for several years, have been formally acquired by the last-named company under approval of the Maine Public Utilities Commission. The Cumberland County company has been authorized to issue $1,494,000 in preferred stock to effect the transfer of all assets of these companies to itself. Electric service is now supplied by the Cumberland County system from the territory north and west of Portland to and including many coast resorts lying south of the city as well as to the Portland district proper.

**Curing Pneumonia by Electricity.**—Physicians connected with St. Mary's Hospital, Hoboken, N. J., report remarkable success in treating pneumonia by an electrical process. The method consists of the application of 2½-in. x 5-in. plates to the chest and the back and the passing of an electrical current through the lungs. This increases the temperatures within the lungs, and its beneficial effect in pneumonia is said to be in breaking up congestion. Heat treatments previously in use did not raise the internal lung temperature sufficiently to clear these organs. The treatments, which have been used only in extreme cases, last twenty minutes and are given twice a day, the current being increased gradually and then gradually decreased. There is no electric shock.

**Indiana Utilities Change Hands.**—The purchase of electric lighting and power plants at Martinsville, Spencer and Gosport, Ind., involving about half a million dollars, has been completed, subject to the approval of the commission. A controlling interest in these companies has been held by the Public Service Securities Corporation of Cincinnati, which has operated the properties for several years. The holdings include the Martinsville Gas & Electric Company, the Morgan County Light & Power Company, the Spencer Light, Power, Heat & Water Company and the Gosport Electric Company. The deal apparently is in accord with the program of developing the light and power business in southern and western Indiana started by the Joseph Brewer interests, the properties lying within striking distance of the proposed high-power transmission line of the Central Indiana Power Company, now constructing a superpower station on the Wabash River south of Terre Haute.

# Associations and Societies

**American Electrochemical Society.**—The forty-third semi-annual meeting of this society will be held at the Hotel Commodore, New York City, on May 3 to 5, 1923. The principal attraction of the technical program will be a whole-day session on the general topic "The Production and Application of the Rarer Metals." The arrangements for this session are in charge of Dr. F. M. Becket of the Electrometallurgical Corporation, New York City. Another session will be devoted to a discussion of "Electrode Potentials," led by Dr. William G. Horsch of the Chile Exploration Company, New York.

### Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Middle West Division, N. E. L. A.—St. Louis, April 11-12 H. M. Davis, Bankers' Life Bldg., Lincoln.

American Society of Mechanical Engineers—Pacific Coast meeting, Los Angeles, April 16-18; general convention, Montreal, May 28-31. C. W. Rice, 29 West 39th St., New York.

Tri-State Water and Light Association—Birmingham, April 17-20. W. F. Steiglitz, Columbia, S. C.

American Physical Society—Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

American Institute of Electrical Engineers—Spring convention, Pittsburgh, April 24-26; annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Sept. 25-28. F. L. Hutchinson, 33 West 39th St., New York.

American Welding Society — New York, April 25-28.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

Electrical Supply Jobbers' Association—Executive committee and general meeting, Hot Springs Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

Missouri Association of Public Utilities—River boat from St. Louis to Peoria, May 24-26.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

North Central Division, N. E. L. A.—Minneapolis, June 13-15. H. E. Young, Minneapolis General Electric Company.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

Canadian Electrical Association — Montreal, June 20-23. Louis Kon, 65 McGill College Ave., Montreal.

American Society for Testing Materials—Atlantic City, June 25-29.

National Council Lighting Fixture Manufacturers—Hot Springs, Va., June 26-28.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan. 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13.

## Commission Rulings

**Sinking Fund to Retire Capital Disapproved.** — The establishment of a sinking fund for the retirement of capital, in addition to the regular depreciation allowances, has been disapproved by the Idaho Public Utilities Commission in a case concerning the Kellogg Power & Water Company. The company contemplated an additional investment and upon this investment desired an allowance of 8 per cent annually and in addition wished to set up a sinking fund out of operating expenses to retire the capital. The commission said that this was equivalent to asking the public to buy the plant and also pay interest on its cost.

**Rules Governing Rehearings.** — In granting a rehearing in a case involving the refusal of the Batesville Electric Light & Power Company to extend service, the Indiana Public Service Commission held that a party not an original petitioner in a proceeding which has been started by the commission on its own motion has the right to ask for a rehearing if the petitioner is clearly a person or corporation in interest. A contention that additional service has been given to other citizens since a petitioner's request for service has been refused on the ground that a public utility is overloaded constitutes an allegation of discrimination which calls for a rehearing.

**Doubt Thrown on Theory of Accrued Depreciation.**—In its contested valuation of the Alabama Power Company's property the Public Service Commission of Alabama expressed doubt of the correctness of the theory that public utility property should be valued according to age and probable duration of life of the constituent parts, since what a utility company sells is service, not a pole, a mile of copper wire or a generator. The matter of accrued depreciation, it held, should not enter greatly into consideration by the rate-making body if the utility property is kept in such a state of efficiency and maintenance that the public is furnished an extraordinarily efficient class of service.

**"Free Service" to City in Return for Use of Streets Not Objectionable.**—The North Dakota Board of Railroad Commissioners held that no discrimination inhered in a contract entered into between the Midwest Power Company and the city of Enderlin by which a small amount of electricity was furnished to the city without charge in return for the use of streets and alleys. It also held that consumers of this company located near the generating plant should not be penalized by the excessive line loss incident to transmission to a neighboring town. The total operating revenues and expenses of the steam-heating and electric departments of the company were considered together in view of the fact that the physical property of the two utilities was so interwoven that it was inadvisable to attempt to separate them. Meter rates for street lighting were declared the only fair method, though the present flat-rate basis was not upset, the rates being found not discriminatory.

**Valuing Developed and Undeveloped Water-Power Sites.**—The contested valuation of the property of the Alabama Power Company made by the Alabama Public Service Commission in the case now awaiting rehearing contained, among other pronouncements, decisions to the following effect: Water power should not be valued by determining the original cost of the water-power site since it is the power and not the site which is to be valued and it is beyond the province of the commission to explore into the future to determine what power sites are going to be developed and what the power therefrom will be worth. Developed water power should be valued at an amount equal to the capitalized savings by use of water power instead of steam power generated in the best manner possible. No value should be assigned to the undeveloped water powers. The capitalized saving by the use of water power was divided by the commission, half being assigned to the utility and half to the public.

**North Dakota Board's Change of Valuation Method.**—In establishing rates for the Western Electric Company of Jamestown, N. D., the North Dakota Board of Railroad Commissioners put into effect its changed method of arriving at values, it having, as already reported in this column, abandoned the historical-cost basis on which it had long worked. It will now base its findings on reproduction cost less depreciation. Explaining this departure, which was brought about by a study of court rulings, the chairman of the board said: "It is a matter of common knowledge that prices of materials have greatly increased since the world war and that to date there is no indication that prices will ever return to the pre-war level. There probably has never been a period when it was so difficult to determine with any degree of accuracy what the prices of materials entering into the construction of a utility will cost as of a future date. Prices continue to fluctuate, and though several years have elapsed since the close of the war, neither labor nor materials have declined to anything like pre-war prices. We doubt if they ever will. Until a permanent level has been reached we cannot attempt to find the so-called 'normal results.' Neither can we prophesy as to the range of prices in the future. We must apply reasonable judgment to all the facts before us and find a value which, in our judgment, represents the fair value of the property used and useful as of the time when the inquiry is made regarding rates. By fair value is meant fair both to the utility and to the consumer."

## Recent Court Decisions

**What Constitutes a Reasonably Safe Place to Work?** — The Kansas City Court of Appeals has sustained a verdict of $5,000 damages awarded in Pyle vs. Kansas City Light & Power Company for injury sustained by an employee who fell over a piece of timber and was precipitated down a flight of stairs. The floor where the timber was lying was alleged to have been insufficiently lighted. The court found that "assumed risk" was not in issue and that it could legally be held that the man injured had not had a reasonably safe place to work. (246 S. W. 979.)*

**Rate Must Have Approval of Commission Before Promulgation.** — Until the rate established by the rate-making authority for the service of a public utility has been set aside by a court of competent jurisdiction the utility has no right to promulgate a rate of its own or to make an added charge for the services rendered. So finding, the Supreme Court of Kansas has affirmed judgment for the plaintiffs in two cases brought against the Citizens' Light, Heat & Power Company (by the State ex rel. Hopkins and by Kilworth et al.) relating to the imposition in Lawrence of a service charge for gas in addition to the established rate. (212 Pac. 86.)

**What Constitutes a Competing Company?**—Asserting (in Commonwealth ex rel. Page Milling Company vs. Shenandoah River Light & Power Corporation) that where a milling company organized and its stockholders controlled an electric company, which transferred its assets to a power company, and the power company contracted to furnish the milling company power at a rate less than that fixed by schedules subsequently filed with the Corporation Commission, the relations between the milling company and electric company did not affect the jurisdiction of the Corporation Commission to establish a rate higher than the contract rate, the Supreme Court of Appeals of Virginia declared that the milling company was not a competing company in the sense of being excepted from those to whom a public utility must furnish service. Nor was there any basis for the claim that by an increase in the power company's rates the milling company's property was taken without compensation or without due process of law. Neither of these reasons therefore operated to prevent the commission from raising the contract rates, which, however, could be done only after investigation and a finding of facts and not by a mere failure to suspend a rate filed with it. (115 S. E. 695.)

Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## Fogarty and Doolittle New North American Executives

James F. Fogarty and Frederick W. Doolittle were elected additional vice-presidents of the North American Company at the annual meeting of the board of directors held on March 21. For the past twenty years Mr. Fogarty has been connected with the company in various capacities and during the greater part of his long service he has been intimately in contact with the financing of the company and its subsidiaries. He entered its employ as stenographer in November, 1902. In January, 1910, he became assistant secretary and in March, 1912, was elected secretary and assistant treasurer. He still retains the office of secretary. Mr. Fogarty has for several years been a director of the North American Company. He is also vice-president and director of the North American Edison Company and secretary and director of various subsidiary companies of the North American Company.

For several years Mr. Doolittle has been intimately connected with the activities of the North American Company and its subsidiaries as a special rate and valuation engineer, with his headquarters at Milwaukee. Mr. Doolittle was born in Hopkinton, Iowa, in 1883. He is a graduate of Princeton University and of the University of Colorado. He taught engineering at the University of Colorado and the University of Wisconsin and assisted in the development of the statistical department of the Wisconsin Railroad Commission. From there he went to Springfield, Ill., where he did similar organization work for the first Illinois Public Utilities Commission. Since 1916 Mr. Doolittle has been retained as consulting engineer by the North American Company and its subsidiaries and has handled investigations of new properties and rate and valuation cases for these companies before various commissions. Mr. Doolittle assumes the duties of his new office April 1.

## Dr. Hutchinson with Sanderson & Porter

It is not surprising that when Sanderson & Porter decided to extend their activities to include railroad electrification they should select to direct the newly organized railroad electrification department Dr. Cary T. Hutchinson, who for thirty years has kept in close touch with practice and problems both here and abroad. In 1891 the firm of Sprague, Duncan & Hutchinson built for Henry Villard the first heavy electric locomotive constructed in this country. The Baltimore & Ohio Railroad Company engaged Duncan & Hutchinson as consulting engineers for the first steam railroad electrification in the United States—built through Baltimore in 1895. From 1906 to 1908 Dr. Hutchinson was engaged by the Great Northern Railway to take charge of the design and construction of the electric equipment of its road over the Cascade Mountains, the first three-phase electrification in the United States. Later the Illinois Central Railroad, which had under consideration the difficult problems involved in its Chicago terminals, appointed Dr. Hutchinson a member of its electrification commission. In 1920 he was selected to take charge of the railway electrification division of the Superpower Survey. He initiated and was the chief engineer of the 100,000-hp. hydro-electric development on the Susquehanna River at Holtwood, Pa., and he has since been connected as consulting engineer with important hydro-electric developments in California, Canada and Mexico. In addition to these activities, Dr. Hutchinson was for a time in charge of the department of electrical engineering at Johns Hopkins University and has written a variety of engineering papers on mathematical and physical topics.

## H. B. Flowers Leaves Baltimore

Herbert Baker Flowers has resigned as vice-president and general manager of the United Railways & Electric Company, Baltimore, to become president of the New Orleans Public Service Company, the successor to the New Orleans Railway & Light Company. For the present Mr. Flowers' duties at Baltimore will be performed by the assistant general managers. Mr. Flowers became general manager of the United company in 1919, when he was promoted from assistant general manager to succeed J. R. Pratt, made vice-president.

Graduated from the law school of the University of Michigan in 1903 and from the engineering school of that university in 1905, Mr. Flowers entered the operating department of the Detroit United Railway. About ten years ago he went to Baltimore to take a position with the United Railways & Electric Company as assistant superintendent of transportation. In 1917 he became assistant general manager. Mr. Flowers is the representative of the American Electric Railway Association on the sectional committee of the American Engineering Standards Committee appointed to formulate a uniform code of colors for traffic signals.

R. S. Hecht, whom Mr. Flowers is succeeding, will retain the chairmanship of the board and continue his supervision of the financial affairs of the New Orleans Company. Mr. Hecht is a prominent figure in the financial and banking activities of New Orleans, and it was largely through him that a workable reorganization plan was effected. A. L. Kempster has been re-elected vice-president and general manager.

# Manufacturing and Markets

**Devoted to the Discussion of Business and Economic Problems of the Producer and Distributor, with Market Reports, Trade Activities, Foreign and Construction News**

## Discrimination Between Customers

**A Wholesaler Is Determined Not by the Quantity He Buys, but by How He Sells**

GREAT interest has been aroused in manufacturing and trade circles over the decision of the United States Circuit Court of Appeals in the Mennen case. If the decision, which is adverse to the Federal Trade Commision, is upheld by the Supreme Court, it will affect not only the matter of price maintenance but also the continuance of the jobber as a factor in distribution. It will also make it easier for independent retailers to meet the competition of chain stores and other combinations. A wholesaler is, according to this finding, determined not by the quantity he buys, but by how he sells.

Commenting on the decision and its effect on the electrical supply business, Franz Neilson of New York City, general counsel of the Association of Electragists International, said:

The Federal Trade Commission has met with a setback in its effort to stop the Mennen Company from taking action in pursuance of its own notion as to who should receive wholesalers' prices on Mennen goods and who should not.

It was the aim of the commission in this case to shape matters so that the only basis upon which there could be any discrimination in prices for goods of the same quality would be the quantity basis. In other words, the commission in its order directed the Mennen Company not to sell its products, when of a uniform quality, at other than absolutely the same price in the same quantity to all purchasers, whether they are retailers, wholesalers, consumers, chain stores or co-operative purchasing associations.

The order was issued by the commission in March, 1922, but this month it was set aside by the United States Circuit Court of Appeals.

The decision of the Circuit Court and the robust language used in the opinion by Judge Rogers are refreshing to business men, not only to the manufacturers, wholesalers and jobbers, but also to that great body of retailers who are frankly retailers and who do not attempt to absorb the profits of both the middleman and the jobber.

The decision means that nothing in the anti-trust laws is to be construed to prevent any business house from following the practices upon which business in the past has been developed and maintained. That is, the following practices may be continued: Payment of a differential discount to middlemen to compensate for their distribution service; refusing at will to sell to any one; selling at will to wholesalers at the same price as to retailers.

In fine, the individual manufacturer, wholesaler or retailer may sell to whom he please at what price he chooses to fix. He may decline to sell to any one for any reason, even if it may be because he does not like the color of the customer's eyebrows. He may give his goods away. But he must not attempt to bind the person to whom he sells. The purchaser must have no more chains on him after he becomes the possessor of the goods than the seller had when they were in his possession.

Apparently, the only limitation on this right of free sale is the very proper one (as set forth in the Clayton act) that the seller should not "discriminate in price between different purchasers where the effect of such discrimination may be to lessen competition or tend to create a monopoly in any line of commerce."

An example of the sort of discrimination prohibited by the Clayton act would be the action of a gasoline producer in picking out a particular territory in which to sell his product below his cost for the purpose and with the result of driving out a competitor.

Making a distinction between a wholesaler and a retailer is *not* the discrimination which is condemned.

All this refers to individual action. It does not mean that any group or association in any trade may determine who are and who are not wholesalers or jobbers in that particular trade. Whether one is a wholesaler or a retailer is a question of fact, not dependent upon the quantities purchased, and the individual seller must determine that question of fact for himself and act accordingly.

## Failures Among Jobbers—A Warning

**Facts About the Mortality Among Electrical Jobbers During the Last Bad Times—Why They Failed**

By E. W. Rockafellow

Assistant General Sales Manager Western Electric Company

E. W. Rockafellow

LAST November, with the assistance of the managers of our branch houses, I endeavored to compile a list of the jobbers of electrical supplies who had succumbed to the bad times during 1921 and the first half of 1922. I knew that there had been a large number who had gone to the wall. Some few were houses of prominence. Most of them were "semi-jobbers," who had come in on the tide of inflation during the war and after war booms and when the pinch grew too severe for them went into bankruptcy, sold out to some older and established jobbing concern, or got out of the business in some other way. But the greater number, of course, were out-and-out failures.

My list was not complete. It was impossible to run down the name of every little "fly-by-night jobber" who sprang up as a parasite on the prosperous era and then faded away before the first adversity, but there were finally fifty names in line, and the geographical distribution of these firms is interesting evidence of how general was the condition. The greater number were in the East. But there were many in the Middle West and some in the South. The Far West was not affected to a like extent by the stresses of this economic upheaval and does not appear on the list.

Two were in Boston, fifteen in New York City, three in Philadelphia, four in Pittsburgh, one in

## Are We Running Into Another 1920?

AFTER the accompanying article by Mr. Rockafellow was in type one of the editors took a proof to him for his final approval and while discussing the unusually heavy buying in the market during the last few weeks, he said:

"Is the electrical industry again running into the same inflated condition as in 1920? Is this abnormal buying to continue until we have passed the highest prices of that most difficult year? Consumers are pyramiding orders—placing them for far more than normal requirements by ordering for months ahead on the more important materials and commodities—copper, porcelain, iron conduit, schedule material, hardware, poles, transformers and power cables.

"This buying is all very fine for the time being. Optimism in bunches. Order books crowded with many millions of dollars of new business. What good is it if not paid for with real money? And what use are these heavy orders if in a few months these consumers become frightened and start tearing up their contracts? What is to become of the goods now being produced to fill these contracts? Does the electrical industry wish to go through another period of readjustment, and do the manufacturers and jobbers wish to lose all that they make this year?

"More confidence in the business of the industry is evident, but this must not be allowed to develop into overconfidence. With increased buying of copper have come higher wages for labor in the mines, which will be paid for by the consumer. If production in this field continues at an abnormal rate, wages and the prices of raw material will advance and excessive competition will result for both."

Richmond, three in Atlanta, three in Chicago, one in Davenport, one in Cleveland, one in Louisville, two in Evansville, one in Cincinnati, four in Detroit, one in Omaha, one in Norfolk, Neb., one in Rapid City, S. D., two in Minneapolis, one in St. Paul, one in Duluth, two in St. Louis and one in San Antonio, Tex.

### TOO MANY JOBBERS

The fundamental reason why there were so many failures of electrical jobbers through this period of stress is easy to state. There were too many jobbers. There were too many real and so-called semi-jobbers in existence at the end of the war boom to make it possible for them all to survive long when business once settled down to normal volume. And they were doomed to early death just as soon as any real condition of business depression developed.

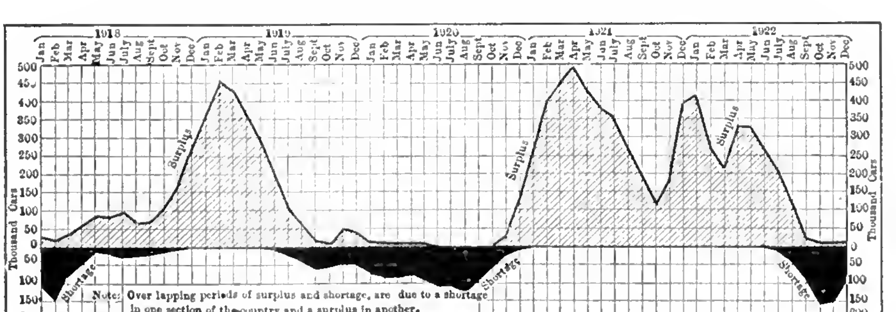
Why were there too many jobbers? There were too many because during the fat years of plenty there seemed to be an unlimited amount of electrical business to be had. Every contractor-dealer whose business grew to proportions where he was using or selling a considerable amount of electrical materials began to get the ambition to be a jobber and make some of the "easy money" that the wholesaler was supposed to be hauling in. But what was far worse, a very large number of manufacturers who should have known better were carried away by their enthusiasm to recognize these aspirants as jobbers.

They were eager to establish more and more outlets, feeling that they would thus obtain a greater proportion of the business. They forgot that the amount of possible consumption of a commodity in a community is not materially affected by the appointment of more wholesale distributors. If it was a case of appointing more retailers who would advertise and sell the commodity or contractors who would install it, thus creating more demand for the line, the sales might be affected. But doubling the number of jobbers can accomplish very little more than to reduce the volume of the business that each can do and thus pare down profit and increase selling cost on that line.

Moreover, a very large percentage of these jobbers who were imposed upon the distributing machinery of the electrical industry by the misplaced zeal of men overexcited by the prosperity of boom times were in no way qualified to be jobbers. They lacked the financial resources. They lacked the experience. They lacked the character and good name by which credit must be supported. They lacked the stock, the catalog, the organization, the ability to serve —yes, and they lacked the customers necessary to a jobbing house that is to do an economic job. They could go ahead during the boom when all that was necessary was to take orders, but when they ran into a buyers' market and were compelled to sell and serve, they were not able to compete with the real jobbers and so they died.

All this is history. But it is experience that is of very vital import right now. For we are again experiencing a period of expansion. The spirit of inflation once more is in the air. Factories are receiving so many orders that it appears as if buyers were already forgetting the evils that inevitably follow "pyramiding." But the lesson of this list of bankrupt jobbers must not and cannot be ignored. It is a warning that every contractor and dealer should keep in mind whenever he feels a hankering for wholesale business. It is a warning to every manufacturer. They were the ones who unmeaningly caused the death of very many of these jobbers by permitting and enabling them to go into a business for which they were neither fitted nor equipped, and they were the ones who suffered the greater part of the losses incurred.

## Five-Year Record of Car Surplus and Shortage



THE chart above, prepared from records of the American Railway Association, shows the trend of surpluses and shortages in freight-car equipment for the five-year period 1918 to 1923.

Attention is directed to the large available surplus of equipment during the fall of 1918, the first seven months of 1919, the entire year of 1921 and the first eight months of 1922. Subsequent to August, 1922, car shortage throughout the country existed to a marked degree, yet it will be noted that when freight-car shortage was at its peak in October, 1922, this figure did not in any way approach the volume of surplus cars during the preceding periods of less demand.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## Wiring Device Production Is Active with Rising Prices

Upward tendencies in the prices of wiring devices combined with heavy absorption of these products into building jobs throughout the country have put severe pressure upon manufacturers of this class of materials since the first of the year. Jobbers' stocks had been sharply reduced prior to Jan. 1 by the fall demand and desire to show a low inventory at the turn of the year. Widespread buying has resulted, and this has been quickened as factory prices have stiffened until at present it is difficult for the manufacturer to accumulate more than a moderate stock. Policies vary considerably as to factory stocking in this branch of the trade, but there is a general feeling among manufacturers that this is the jobber's function rather than the wiring-device maker's, and it is a satisfaction in production circles to be again filling orders for distributors' shelves as well as to meet the current demands of the market.

Representative opinion in manufacturing circles seems to preclude any serious danger of a runaway market for wiring devices at this time. Jobbers are buying with conservatism, delivery conditions within reasonable radius of the factories are improving, and the requirements of the coming spring and summer construction programs are pretty well realized. Little evidence of pyramiding orders is in sight, and the wiring-device makers are so far able to keep pretty well up with the demand without operating their plants to any extent overtime or at night. Considerable satisfaction is being expressed in jobbing circles relative to the price schedules now in effect on such material as sockets. In typical cases, for example, jobbers are distributing pull sockets in case lots at about 37.5 cents net, whereas in the not distant past these were moving to the contractor-dealer at 30 cents or even lower under acute competition. One prominent producer stated last week that too many jobbers have been trying in the past to sell such items as sockets on the basis of a 5 per cent profit, and this, he held, is utterly inadequate to cover costs and overhead. There has unquestionably been a growing feeling on the part of not a few jobbers that the spread between the factory price and the price paid by the ultimate consumer might fairly be divided so that the jobber will obtain a larger proportion of this without injustice to the contractor-dealer.

Transportation conditions constitute a primary difficulty in this branch of trade, but manufacturers are meeting customers' requirements reasonably well by recourse to selected rail shipment, water and motor-truck service. Railroad embargoes have been on in some districts for many weeks, but by roundabout routing the more troublesome situations are being relieved. Stocks of raw material are being built up as fast as possible, and no serious shortages are reported in Eastern manufacturing circles. One house, however, had over $100,000 worth of porcelain on hand a few days ago, and considerable money is for the time being tied up in brass and other material.

## Instrument Business Reported Excellent

Conditions are unusually favorable at present in the electrical instrument field for an excellent business. While industrial plant expansion has been greatly restricted since the war, changes in production methods and modifications in the use of plant have led to a large amount of electrical material and apparatus buying which has been reflected in the instrument trade as well as elsewhere. This is particularly apparent in industrial electric heating installations, where the requirements of accurate control of processes and energy measurement bearing upon rates and plant economies have led to the more extensive use of both indicating and recording equipment.

The higher-grade radio sets are utilizing a considerable quantity of small indicating instruments, and the requirements of the automobile industry continue to grow, the sale of panel-type voltmeters and ammeters being commensurate with the volume of car production. The continued rapid expansion of the central station is also absorbing a large quantity of measuring apparatus. Skilled labor is none too plentiful, but raw materials are being secured with reasonable success by instrument makers, and prices are firm without much reported change from month to month.

## Delinquent Accounts Are Much Lower

Reports from the National Electrical Credit Association show that the number of delinquent accounts reported for January and February, 1923, were much lower than for the same period in 1922. This was especially true in the Central Division, where the number of accounts in February, 1923, was 635 as against 838 in February, 1922, with respective total amounts of $69,996.47 and $97,311.30. The average account for February, 1923, was lower than either that of February, 1922, or that of January, 1923.

In the New York territory the February, 1923, report totaled only 283, valued at $36,045, as against 393 with a value of $63,082 in February, 1922. For the same period the average amount was $127 against $160. The February accounts for Philadelphia were increased by fifty, raising the total average amount to $152.73. In New England the February, 1923, accounts were only forty-eight, with a value of $51.99—a decrease over the same period in 1922 of eleven accounts and a difference in the average value of $36.40. The February, 1923, delinquent accounts for the Pacific Coast numbered sixteen, with a total value of $283.04. The tabulated list of accounts for January and February is as shown in table above.

DELINQUENT ACCOUNTS IN JANUARY AND FEBRUARY

| Branch and Month | Number of Delinquent Accounts Reported | Total Amount | Average Amount |
|---|---|---|---|
| Central Division: | | | |
| January 1922.. | 820 | $93,956.53 | $118.24 |
| January 1923.. | 809 | 88,811.52 | 109.78 |
| February 1922.. | 838 | 97,311.30 | 116.12 |
| February 1923.. | 635 | 69,996.47 | 107.49 |
| New York: | | | |
| January 1922.. | 325 | 48,429.00 | 150.00 |
| January 1923.. | 392 | 54,452.00 | 139.00 |
| February 1922.. | 393 | 63,082.00 | 160.00 |
| February 1923.. | 283 | 36,045.00 | 127.00 |
| Philadelphia: | | | |
| January 1922.. | 216 | 32,449.17 | 150.23 |
| January 1923.. | 212 | 30,786.13 | 145.22 |
| February 1922.. | 126 | 16,878.00 | 133.95 |
| February 1923.. | 176 | 26,881.67 | 152.73 |
| New England: | | | |
| January 1922.. | 3 | 454.48 | 151.49 |
| January 1923.. | 66 | 7,805.66 | 118.27 |
| February 1922.. | 59 | 5,214.64 | 88.39 |
| February 1923. | 48 | 2,495.35 | 51.99 |
| Pacific Coast: | | | |
| January 1922.. | 16 | 2,002.00 | 125.12 |
| January 1923.. | 12 | 1,087.20 | 90.60 |
| February 1922.. | 14 | 806.45 | 57.63 |
| February 1923.. | 15 | 4,245.63 | 283.04 |

## Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | $0.0322 | $0.0303 | $0.0239 |
| Cold finished shafting, per lb. | 0.0406 | 0.0397 | 0.0333 |
| Brass rods, per lb. | 0.1870 | 0.1804 | 0.15 |
| Solder (half and half), per lb. | 0.2887 | 0.2617 | 0.20 |
| Cotton waste, per lb. | 0.1181 | 0.1181 | 0.109 |
| Washers, cast iron (½-in.), per 100 lb. | 4.33 | 4.33 | 3.83 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 2.96 | 2.96 | 3.11 |
| Machine oil, per gal. | 0.349 | 0.349 | 0.40 |
| Belting, leather, medium, off list | 49% | 49% | 46¼% |
| Machine bolts, up to 1-in. x 30-in., off list | 51⅓% | 51⅓% | 64½% |

## The Metal Market

**Prices Show No Tendency to Weaken—Copper Quoted at Highest Price Since October, 1920**

Prices in the metal market show no tendency to weaken owing to the continued excellent business of metal consumers in most parts of the country and the large amount of metal they are taking on a contract basis.

With practically all producers asking 17⅜ cents delivered, copper is quoted at the highest price since October, 1920, when it passed that level on its downward movement. It is interesting to note that until last week the resumption of the advance was not inspired so much by the demands of domestic consumers as by speculative dealings abroad. When the price wavered at 17 cents and was weak in London two or three weeks ago, there was considerable short selling on the London market by international interests who thought a reaction was due. The copper which they sold short was quickly picked up. However, the reaction in price was not so marked nor so long continued as they expected and in seeking to cover at around 16.60 to 16.75 cents they quickly pushed the price back to 17 cents and even beyond.

NEW YORK METAL MARKET PRICES

| | Mar. 21, 1923 Cents per Pound | Mar. 28, 1923 Cents per Pound |
|---|---|---|
| Copper | | |
| Electrolytic | 17.00 | 17.37½ |
| Lead, Am. S. & R. price | 8.25 | 8.25 |
| Antimony | 8.75 | 8.75 |
| Nickel, ingot | 30.00 | 30.00 |
| Zinc, spot | 7.50 | 7.65 |
| Tin, Straits | 47.25 | 48.00 |
| Aluminum, 98 to 99 per cent | 26.00 | 26.00 |

## The Week in Trade

**Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points**

TREND of prices is still upward, with sales somewhat slower than one or two weeks ago. In some sections of the country expressions of fear are heard that the momentum of rising prices and rapid business expansion may bring about depression in the market unless checked within a few weeks. Some reaction is already being felt in the Far West in the delay or abandonment of important investment projects.

**Boston** The trend toward larger volume of business continues. Rail embargoes have been slightly relaxed and short stocks have been to some extent relieved during the week. The trend of prices is still upward. Building contracts let have decreased somewhat. Central-station buying of line material is more active and pole replacements due to flood conditions are imminent in the interior valleys. Money is easy, and, despite the growth of trade, little evidence appears of inflation. There is a shortage of radio equipment and insulating material.

**New York** A slight falling off in sales to the dealers and contractors is noted in jobbing circles following the unusually heavy buying during the last three weeks with the rising market for copper, porcelain and other raw materials. This decrease in activity seems to be well taken by most of the distributors, as they are of the opinion that overstocked shelves in face of present prospects will result in depression in later months. Central-station orders to the manufacturers are increasing gradually. Much improvement in radio business is evident with no signs of a let-up in demand during the next few weeks. Collections are gradually improving.

**Baltimore** Market conditions are very bright at the present time. The price trend of practically every article is on the increase. Conduit boxes are remarkably active and motors show quite a decided activity. The market on wire in all forms is very active with prices very much on the increase at the present time. The past week has been most encouraging to the jobbers, while the prospects for the future are excellent.

**Atlanta** The electrical business as a whole continues good. Jobbers report that vacuum cleaners are growing more popular every day and sales are considerably in excess of those for this time last year. With the opening up of spring and the launching of proposed sales campaigns the demand should pick up even more. Good stocks are in the territory. Electric sign sales are being pushed and good results are reported. The movement of electric ranges is reported satisfactory, particularly in the small towns where sales campaigns are under way. General price increases are reported in cable, bare copper and weatherproof wire, but these have served in no way to check the demand for these articles.

**Pittsburgh** Prices during the week to a great extent remain firm with slight increases in wire and cable, although there is a tendency for quite an increase in pole-line material. Business generally is good and increasing every day. A slight spirit of pessimism is seen among the electrical interests, due to the steady increase of prices, as these continued increases have a tendency to cause an unsettled condition. Business among the contractor-dealers is fairly good, although not in proportion to the home building that is being done. Investigation shows that a good many of the small homes that at being built in the suburban districts are not being wired.

**Cleveland** Electrical sales keep pace with general business, improvement being more pronounced in industrial equipment, with central-station business showing much stability. Construction of apartment houses and single dwellings has accelerated appliance sales to a fair degree, and the market for meters is reported to be more active. Poles, pole-line hardware, porcelain and wiring devices are in good demand with the advent of the repairing season. Conduit stocks have recovered in a small way, and the demand is quite brisk. Farm-lighting plant sales are slow.

**Chicago** Buying is steady and prices generally are firm, with the exception of conduit. Difficulty is experienced in obtaining satisfactory shipping dates since deliveries are promised from four to twelve weeks. Pipe advanced two to three points this week. Pole-line hardware demand has been active despite the recent advance of about 10 per cent. Jobbers and manufacturers report exceptionally good sales, although stocks are somewhat depleted. Fiber prices have advanced 16 per cent and stocks are still low.

**St. Louis** Business conditions in electrical lines, according to manufacturers and jobbers, are very satisfactory. There is an exceptional demand for motors and transformers for industrial purposes, and deliveries from the manufacturers are slowing up. Owing to freight congestion considerable difficulty is being encountered in getting shipments through. Stocks of wire and conduit are still low with deliveries promised for sixty days or longer and shipments uncertain. Many prospects are reported for industrial heating equipment for a variety of different uses. Exceptionally large sales of vacuum cleaners and washing machines are reported.

**St. Paul-Minneapolis** Jobbers say dealers believe the peak of the price rise has been reached, and buying on the rising market that was started late in February has stopped. Jobbers also say business is normal for this time of the year. Inquiries coming in and other indications point to greatly increased activities next month. The conduit situation is declared serious.

**Denver** Building permits for the first three months of 1923 are in excess of $4,000,000, a 40 per cent advance over the same period of last year. Jobbers' stocks are not overloaded, and few if any contractors have surplus supplies. Even central stations are conservative in placing

# Demand, Supply and Price Trend of Nineteen Commodities as Sold in Sixteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Next Week Reports will include Farm Lighting Plants, Signal Apparatus, and Electric Tools

orders unless for specific improvements. Apparently the experience of several years back is responsible for the caution now being exercised. In the southern part of the state extensive range campaigns have been started, while in Denver an industrial gas movement is imposing several obstacles in the way of electric development.

**Salt Lake City** Building activity will be in full swing within several weeks. The market for mining machinery and equipment has not been so active in several years, indicating a rapid return to capacity production as well as much new development of new mineral projects. Coal mines are producing on a large scale.

**Portland-Seattle** Shipping is once more in the ascendency and the employment situation is good. Weather conditions in the wheat country are favorable for a large crop this summer, and building construction is very active. The price trend in material as well as wages is upward. While present reports generally are good, there is a fear expressed in certain sections that the momentum of rising prices and business expansion may carry the movement beyond the point where this prosperous condition can be maintained, resulting in depression. In some sections a reaction against rising costs is already being felt in the delay or in the abandonment of important investment projects. The building activity of the Northwest creates an ever-increasing demand for meters. Deliveries are improving and at present are very satisfactory. Precision instruments are reported in active demand by the schools and colleges throughout the territory.

**San Francisco** Business continues good with well-assorted orders, adequate stocks and fair prospects. Collections show very slow improvement, running close to seventy days. A flexible-cord shortage threatens because of the oversold condition of factories and there now exist in some quarters very low prices. Several appliance manufacturers are supplementing their standard flatirons, pads, toasters and the like by cheaper lines.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Chile Copper to Sell Production Through Subsidiary

The Chile Copper Company, control of which was recently acquired by the Anaconda Copper Mining Company, will in the future sell its own production through its subsidiary and operating company, the Chile Exploration Company. The sales will be handled by Edward Mosehauer, who until recently was sales manager of the United Metals Selling Company. The Chile Copper Company, it is said, is producing 18,000,000 lb. of copper monthly, and it is pointed out that with this amount of copper to sell the Chile Exploration Company will rank among the five largest sellers of the red metal in this country.

## To Hold Power Show April 2-7

The Power Show, one of the series of specialized electrical shows being held this spring by the New York Edison Company for manufacturers, is scheduled for the week of April 2-7. It will be held in the Irving Place Showroom, Irving Place and Fifteenth Street, and the exhibits will include industrial power equipment, ventilating apparatus, electrically operated refrigerating machinery and electric elevator equipment.

## Knox Porcelain Will Soon Start Erection of $75,000 Plant

The Knox Porcelain Company, Knoxville, Tenn., recently organized with a capital of $370,000, has acquired about five acres and will soon commence the erection of the first unit of its proposed plant to manufacture electrical porcelain products. It will include a power house, machine shop and other buildings, estimated to cost $75,000. Later two additional units will be built. J. N. House is president.

## Radio Corporation May Show Income of $3,000,000

The Radio Corporation of America is expected to show income after depreciation, charges, etc., for the year ended Dec. 31, 1922, of approximately $3,000,000. This compares with $426,799 balance after charges applied to amortization of patents in the year 1921. The capital stock of the company as of Dec. 31, 1921, consisted of 3,955,974 shares (par $5) preferred and 5,732,000 shares (no par) common, against which the balance sheet showed an equity of $2.11 a common share. No dividends have been declared on either class, but a preferred dividend becomes cumulative at the close of 1923.

Gross sales booked during the year 1921 totaled $1,468,919. Sales in January, 1923, are said to have reached about $1,500,000, and in February, 1923, approximately $2,000,000. Since October, when the slump in demand for radio apparatus terminated upon absorption of jobbers' and dealers' surplus stocks, there has been a steady increase in the sales of radio products.

## Westinghouse Makes Changes in Los Angeles Office

A number of changes in the Los Angeles office of the Westinghouse Electric & Manufacturing Company have been announced by W. S. Rugg, general sales manager of the company. The power division has been changed to the central station division and J. C. Jones has been appointed manager. Mr. Jones is also in charge of the sale of supply apparatus in that territory. The railway division has been changed to the transportation division and G. B. Kirker has been appointed manager. A merchandising division has been established with J. H. Jamison as manager, and an engineering division has also been established with R. A. Hopkins as manager.

## Establishes Second Branch in South America

The A. H. Keleher Company, 44 Whitehall Street, New York City, direct factory representative for electrical exporting, announces the establishment of a branch office in Rio de Janeiro, Brazil, which is in charge of Burton W. Peabody. Another branch of the Keleher company, under the name of Keleher & Libert, is in Buenos Aires.

## To Manufacture and Sell Heating Apparatus

The Electric Furnace and Equipment Company, Kansas City, recently incorporated with a capital of $300,000, announces that it will develop, produce, manufacture, sell and dispose of heating apparatus and all equipment and appurtenances thereto. Incorporators: H. J. Plagens, H. N. Olsen, F. H. Longacre, F. R. Andrews and Mrs. F. H. Longacre.

## Tubular Woven Fabric Expands

Increasing business at the factory of the Tubular Woven Fabric Company, Pawtucket, R. I., will necessitate the early building of additional storehouse and shipping department facilities. The company reports marked activity in the demand for non-metallic flexible conduit, notwithstanding adverse transportation conditions. Northern New England is absorbing large quantities of this class of material, and the factory is running full time.

## U. S. Steel Net Income for 1922 Amounted to $58,840,801

The twenty-first annual report of the United States Steel Corporation and subsidiary companies as issued on March 21 shows a net income for the year 1922 of $58,840,801.60. The total earnings were, after deducting all expenses incident to operations, including ordinary repairs and maintenance (approximately $88,000,000) and taxes (including reserve for federal income taxes), $109,788,916.32. The balance of earnings after deducting interest on outstanding bonds and mortages of the subsidiary companies, which amounted to $8,259,605.93, was $101,529,310.39. Charges and allowances for depletion and depreciation were applied as follows, viz.: To depreciation and replacement reserves and sinking funds on bonds of subsidiary companies, $33,382,624.09; to sinking funds and bonds of the United States Steel Corporation, $9,305,884.70.

## Merger of Dayton Jobbers

Merger of the M. D. Larkin Supply Company and the William Hall Electric Company, electrical supply jobbers, Dayton, Ohio, with an authorized capital stock of $1,200,000, has been announced by Maurice D. Larkin, president of the new company, which is now being operated under the name of the M. D. Larkin Company.

With the announcement of the consolidation, President Larkin also stated the company will later erect a modern six-story office and mercantile building that will meet the needs of the new company. This structure will house the offices as well as the various departments and will provide 85,000 additional square feet of floor space.

Through the merger, the M. D. Larkin Supply Company and the William Hall Electric Company are absorbed. Although the latter firm will operate its electrical division of the new company under its present name, it will be owned and supervised by the M. D. Larkin Company.

## General Electric Completes Atlanta Warehouse

The General Electric Company has announced the completion in Atlanta of a four-story reinforced-concrete warehouse, equipped with all facilities for prompt and efficient handling of orders. The initial building has a floor space of 64,000 sq.ft., and provision is made for later increase to 100,000 sq.ft. as conditions warrant. The warehouse is located on the Southern Railroad with an inside car siding and inside motor truck pits with electric cranes operating over the pits.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase and agency is desired in Egypt (No. 5,830) of general electrical appliances, motors, generators and engines.

Purchase and agency is desired in Switzerland (No. 5,831) of radio telegraph and telephone apparatus.

Purchase is desired in Norway (No. 5,832) of radio receiving outfits.

Agency and purchase is desired in France (No. 5,838) for trucks and automobiles (electric vehicles).

ELECTRICAL EQUIPMENT FOR RAILWAY, BOMBAY, INDIA. — Bids will be received by the directors of the Great Indian Peninsula Railway Company, 48 Copthall Avenue, E. C. W., London, England, until April 24 for equipment for electrification of Bombay suburban lines as follows: (1) Transformers; (2) cables; (3) switchgear and accessories; (4) converter sets. Further information may be obtained from Merz & McLellan, 32 Victoria Street, Westminster, S. W. 1, consulting engineers.

CONCESSION GRANTED TO UTILIZE WATER POWER OF THE DANUBE RIVER, AUSTRIA. — The Oberösterreichische Wasserkraft und Elektricitäts Gesellschaft of Linz has been granted a concession to use a maximum of 10,000 hp. from the Danube River to generate electricity.

PROPOSED DISTRIBUTION SYSTEM FOR SEINE DEPARTMENT, FRANCE.—The Ouest-Lumière Company has applied for a concession to build a distribution system to supply electricity in twenty-four communes in the Seine Department.

INCREASE IN ELECTRICAL DEVELOPMENT FOR RAILWAY PURPOSES IN FRANCE.—At present about 2,000,000 hp. is being used in French industries, and the energy to be employed in railway electrification, according to *Commerce Reports*, is expected to increase this to 3,000,000 hp. within the next two years. Expenditures proposed for 1923 on the Midi Railroad include 124,000,000 francs for the electrification of 1,500 km. (932 miles) of line. The Paris-Orleans line plans to spend 90,000,000 francs this year, part of which will be for power-plant construction. The state railroad electrification program calls for an expenditure of 45,000,000 francs principally in the Paris district, and the Paris-Lyons-Mediterranean Railway calls for an expenditure of 11,000,000 francs, which is to be used on the line between Culoz and Modane.

## New Apparatus and Publications

TOOLS FOR HIGH-VOLTAGE WORK.—Bulletin No. 2, entitled "Hot Line Tools," issued by the W. T. Safety Tool Company, Inc., Decatur, Ill., covers the company's line of tools for high-voltage work.

GRAPHIC INSTRUMENTS. — Bulletin No. 223 issued by the Esterline-Angus Company, Indianapolis, describes several unusual uses to which its graphic instruments have been successfully applied.

OUTDOOR BUS SUPPORTS.—Schweitzer & Conrad, Inc., 4,435 Ravenswood Avenue, Chicago, is distributing bulletin No. 203, covering its "S. & C." outdoor bus supports.

FARM-LIGHTING PLANTS, BATTERY-CHARGING APPARATUS, ETC. — The Main Electric Company, Cleveland, is distributing bulletin No. 175, describing its farm-lighting plants, battery-charging apparatus, radiophone receiving sets, automobile batteries, etc.

LIGHTING FIXTURES.—The St. Louis Brass Manufacturing Company has brought out a line of residence lighting fixtures, known as "Polycraft."

TIME SWITCH.—A new electric time switch for controlling lamps in show windows, electric signs, etc., has been developed by the United States Time Switch Company, Denver.

ELECTRIC BLOWER.—An electric hand blower for removing dust from electrical apparatus has been developed by the United States Electrical Tool Company, Cincinnati, Ohio.

WASHING MACHINE. — An electric washer of the oscillating type, "Greyhound," has been developed by the Meadows Manufacturing Company, Bloomington, Ill.

PRESSURE AND VACUUM GAGES.—Catalog No. 1,006 issued by the Bristol Company, Waterbury, Conn., covers its various types of "Bristol" pressure and vacuum recording gages. The catalog also gives a great variety of charts showing the adaptability of the gages to practically every application where pressure of liquids, gases, steam or air is required to be measured.

MOTOR-GENERATORS, DYNAMOTORS AND ROTARY CONVERTERS. — Bulletin No. 242 issued by the Electric Specialty Company, Stamford, Conn., describes the "Esco" motor-generator sets, dynamotors and rotary converters.

STEAM TURBINES. — The De Laval Steam Turbine Company, Trenton, N. J., is distributing a leaflet entitled "De Laval Equipment in a By-Product Plant," in which it advocates the use of steam turbines for driving heavy machinery exposed to carbon dust and grit.

ELECTRIC VACUUM CLEANER.—The Hurley Machine Company, 24 East Jackson Boulevard, Chicago, has recently placed on the market a new vacuum cleaner, known as the "Hurley Thor No. 77 electric brush-type cleaner."

THEATER LIGHTING.—"The Control of Lighting in Theaters" is the title of bulletin No. 28 issued by the Frank Adam Electric Company, St. Louis, the purpose of which is to give some standardized practice for lighting theaters.

## New Incorporations

THE MARIANNA (FLA.) LIGHT & POWER COMPANY has been incorporated with a capital stock of $250,000. The officers are: G. M. Thomas, president, and F. M. Golson, secretary and treasurer.

THE BARBOURSVILLE (WEST VA.) WATER & LIGHT COMPANY has been chartered with a capital stock of $50,000 by H. E. and P. E. Love.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

CAMBRIDGE, MASS. — The Cambridge Electric Light Company is planning to place its wires underground in the congested districts during the coming year. Welles E. Holmes is treasurer and manager.

CONCORD, MASS. — Plans are under consideration for utilizing fuel oil in the municipal electric plant; also for the installation of a new steam end on the Westinghouse-Parsons turbine. Everett E. Pierce is business manager.

HOLYOKE, MASS.—The American Writing Paper Company plans to equip its mills for electrical operation to replace present water-power service.

HOLYOKE, MASS.—The remodeling of the entire electric plant is under consideration by the Municipal Gas and Electric Department. A. W. Darby is superintendent.

PRINCETON, MASS.—The transmission and distribution lines of the municipal electric lighting system are to be extended about 6 miles this spring. F. W. Bryant is manager.

SPRINGFIELD, MASS.—Electric power equipment will be installed in the proposed new ice and refrigerating plant to be erected by the Eastern States Refrigerating Company, to cost about $200,000.

WAKEFIELD, MASS.—The commissioners of the municipal electric light plant will erect a 13,000-volt transmission line from Woburn to the new substation and will install an ornamental lighting system in the business district, covering about ½ mile. S. H. Brooks is manager.

HARTFORD, CONN.—The Veeder Manufacturing Company will make extensions to its power house in connection with extensions in its mechanical counter manufacturing plant. Buck & Sheldon, 60 Prospect Street, are architects and engineers.

## Middle Atlantic States

BROCKPORT, N. Y.—Plans for the proposed addition to the plant of the Moore-Shafer Shoe Company include a power plant of about 200 hp. capacity.

CAZENOVIA, N. Y.—The construction of a single-phase, 2,200-volt rural line, 2 miles long, and several underground extensions are under consideration by the Cazenovia Electric Company. R. Philip Hart is manager.

CHELSEA, N. Y.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until April 16 for an ice-making and refrigerating plant at the United States Veterans' Hospital, Chelsea.

CHURCHVILLE, N. Y. — At a recent election the voters authorized the construction of a new power house and the purchase of new pumping equipment. R. E. Gaskin Company, Cutler Building, Rochester, is engineer.

LOCKPORT, N. Y.—The Council has authorized preliminary estimates to be secured of cost of a municipal power plant. Donald S. Moore is city engineer.

MONTICELLO, N. Y.—The Murray Electric Light & Power Company is planning to erect a 33,000-volt transmission line to Liberty, a distance of 12 miles.

NEW YORK, N. Y.—The Huasteca Petroleum Company, 120 Broadway, has plans for a power plant at its oil refinery at Tampico, Mexico, to cost about $5,000,000. Work has been started on the second refining plant unit.

POTSDAM, N. Y. — The St. Lawrence Transmission Company contemplates extending its high-tension system in the towns of Fowler, Rossie and Macomb. The cost is estimated at $100,000.

WATERTOWN, N. Y. — The Northern New York Utilities Company will build a two-story machine and service works, to cost $100,000.

ALLENTOWN, PA. — Electric power equipment will be installed in the proposed cold-storage plant to be built by John L. Lordan, Allentown, and associates in connection with a warehouse, to cost about $400,000.

CLEARFIELD, PA. — The Penn Public Service Company has arranged a merger with the Erie (Pa.) Lighting Company, Erie, to construct plants and system to operate in eight counties in Western Pennsylvania.

HARRISBURG, PA. — The North Penn Power Company, recently organized, has acquired and will merge the following power companies: Blossburg Electric Light & Power, Morris Run Electric, Mansfield Electric, Bloss, Ward, Tioga, Nelson, Richmon, Osceola, Lawrence, Westfield, Elkland, Deerfield and Duncan Township Electric companies; Knoxville, Elkland, Westfield and Lawrenceville Interborough Electric companies. Plans are being made for the erection of additional transmission lines. Samuel W. Fleming, Jr., is president.

MEDIA, PA.—Improvements are contemplated to the municipal electric light and water plant, including the installation of a new boiler and waterwheel. P. E. Ahern is superintendent.

NEWPORT, PA.—Frank Warren, Y. M. C. A. Building, Harrisburg, is at the head of a project to construct and operate a hydro-electric power plant in Newport, to cost about $525,000.

PHILADELPHIA, PA. — The Philadelphia Electric Company has filed plans for an addition to its power plant at Beach and Palmer Streets, to cost about $2,300,000. John T. Windrim, Commonwealth Building, is architect.

RINGTOWN, PA.—The Ringtown Electric Light, Heat & Power Company contemplates extending its lines into the rural districts. J. A. Yost is secretary and manager.

TATAMY, PA.—The Tatamy Light, Heat & Power Company contemplates the erection of 3 miles of transmission and distribution lines, opening up new territory, and establishing a wholesale salesroom for electric devices, including motors, electric ranges, heaters, fixtures, house wiring and material. A. C. Messenger is general manager.

ANNAPOLIS, MD.—Bids will be received by the Bureau of Supplies and Accounts, Washington, D. C., until April 3, for a 50-kw. generating set, oil-engine-driven (Schedule 637).

BALTIMORE, MD.—The H. E. Crook Company, Inc., 28 Light Street, plans to build a power house in connection with its proposed drydock and ship repair works at the foot of McComas Street. The cost of the project is estimated at $1,000,000.

PRINCESS ANNE, MD.—Improvements are contemplated to the local electric plant, owned by Everett C. Carman, during 1923, including the installation of one 50-hp. oil engine directly connected to a 40-kva. alternator and one 100-hp. oil engine directly connected to a 75-kva. alternator.

WILLIAMSPORT, MD. — The Potomac Public Service Company contemplates the construction of an additional unit at its local hydro-electric power plant.

FREDERICKSBURG, VA.—The Rappahannock Electric Light & Power Company, it is reported, contemplates extensions to its electric power plant to increase the capacity by 400 hp.

MARTINSVILLE, VA. — The American Dining Room Furniture Company will build a power house in connection with its proposed local factory, to cost about $90,000.

RICHMOND, VA.—Bids will be received at the office of the Director of Public Utilities, City Hall, Richmond, until April 18 for construction of a mechanical filter plant, including six electrically driven centrifugal pumps. Fuller & McClintock, 170 Broadway, New York City, are engineers. E. W. Trafford is director of public utilities.

WASHINGTON, D. C.—Bids will be received by the Commissioners of the District of Columbia, District Building, until April 13 for electric lighting fixtures for public schools.

## North Central States

GRAND HAVEN, MICH.—Improvements are contemplated to the municipal electric light plant, including an addition to building, installation of an additional turbo-generator of 1,500 kw. to 2,000 kw. capacity, a 200-hp. boiler, new piping, etc. Paul R. Taylor is city manager.

KALAMAZOO, MICH.—The Kalamazoo Vegetable Parchment Company has issued $1,700,000 in bonds, part of the proceeds to be used for the completion of a power plant and addition to the mill.

L'ANSE, MICH. — The officials of the L'Anse hydro-electric plant plan to erect about 2 miles of transmission lines this year. F. H. Monson is superintendent.

MONROE, MICH.—The Monroe Board & Lining Company, First National Bank Building, contemplates the construction of a power house in connection with its proposed paper mill.

PORTLAND, MICH.—The installation of a 200-hp. Diesel engine and generator in the municipal electric plant is under consideration. E. L. Jenkins is manager.

SHEPHERD, MICH. — The Municipal Electric Light & Power Company contemplates rebuilding its distribution lines and street-lighting system, the latter to be a series system, to be operated from a tub transformer already installed. Harry L. Post is superintendent.

CLEVELAND, OHIO.—Bids will be received at the office of the Commissioner of Purchases and Supplies, City Hall, until April 6 for a transformer house for the division of light and power.

CLEVELAND, OHIO.—Bids will be received at the office of the Commissioner of Purchases and Supplies, City Hall, until April 6 for furnishing "Mazda" lamps to the various departments of the city, board of education and public library, all the lamps required for a period of one year, in the amount of approximately $50,000.

EAST PALESTINE, OHIO.—The installation of a 500-kw. generator in the municipal electric plant is under consideration. F. W. Reese is clerk.

MARYSVILLE, OHIO. — The Marysville Light & Water Company is planning to install a new street-lighting system, using series "Mazda" lamps, and to make extensive repairs and rebuild system in Marysville and Milford Center. G. C. Wilkins is superintendent.

MARTINS FERRY, OHIO.—Bonds to the amount of $400,000 have been authorized for the construction of a combined electric light and water plant. The lighting plant to have a capacity of 2,000 kw. Surveys have been made for the proposed plant, but as yet an engineer has not been engaged. J. W. Tush is superintendent.

TORONTO, OHIO.—Bids will be received by the board of trustees of public affairs of the village of Toronto until April 10 for furnishing one 2,000,000-gal.-per-day motor-driven centrifugal high-lift pump and one 2,000,000-gal. per-day motor-driven centrifugal low-lift pump, with necessary electrical installations, pipings, etc. Hudson & Myron, Wabash Building, Pittsburgh, Pa., are engineers.

GARY, IND.—The Gary Street Railway Company plans to build a substation in the Glen Park district.

PEORIA, ILL. — The Illinois Electric Power Company, successor to the Illinois-Edison Company, has issued $3,500,000 in bonds, the proceeds to be used for the construction of a steam-driven power plant on the Illinois River near Peoria, to have a capacity of 53,000 hp.

CAMERON, WIS. — Agitation has been started by local business men relative to the construction of a dam and hydro-electric plant, for which surveys already have been made. Capital to carry out the project, it is understood, will be available as soon as flowage rights have been secured.

IRON RIVER, WIS. — The Iron River Light, Water & Telegraph Company has applied to the Railroad Commission for permission to replace its dam in the Iron River with a larger one in order to secure more power for its system.

PARK FALLS, WIS. — The Flambeau Power Company has petitioned the Railroad Commission for permission to raise and enlarge its Lower Park Falls Dam.

PORT WASHINGTON, WIS.—The Council contemplates installing a central heating plant in the water and light plant, also new boilers, etc., and an addition to the power house. The cost is estimated at about $125,000.

THREE LAKES, WIS.—Bids are being received by H. M. Olkowski, town clerk, for the erection of a 10-mile high-tension transmission line and a street-lighting system.

MIZPAH, MINN.—The Northern Light & Power Company is planning to extend its transmission line to Gemmel, a distance of 5½ miles. G. J. Holt is owner and manager.

CEDAR FALLS, IOWA.—The installation of new boilers in the municipal electric and water plant is under consideration. C. H. Streeter is superintendent.

EDDYVILLE, IOWA.—A multiple single-lamp electrolier system, consisting of twenty-four posts and fittings and about 2,000 ft. of three-wire underground cable, will be installed. The rebuilding of some distribution lines is under consideration. C. E. Chord is superintendent of the municipal electric plant.

IDA GROVE, IOWA. — The Ida Grove Electric Light Company is planning to replace its present boilers with three 150-hp. Frost boilers. William J. Fawcett is manager.

MAQUOKETA, IOWA.—Bonds have been voted for $70,000 for a municipal power plant and system. Burns & McDonnell, Interstate Building, Kansas City, Mo., are consulting engineers.

MUSCATINE, IOWA.—Bids will be received by the board of electric light trustees of the city of Muscatine until April 18 for construction of an electric light plant, distribution system, substation and ornamental lighting system. Plans and specifications may be obtained from Arthur L. Mullergren, Gates Building, Kansas City, Mo., consulting engineer. B. C. Benham is clerk of board.

WATERLOO, IOWA.—The installation of a 12,500-kva. turbo-generator with surface condenser and auxiliaries is under consideration by the Citizens' Gas & Electric Company.

PALMYRA, MO.—The Light and Water Department is considering the installation of a directly connected oil-engine unit of 100 hp. or 150 hp. in the municipal electric light plant. H. M. Howard is superintendent.

ST. LOUIS, MO.—Bids will be received by the Board of Public Service, City Hall, until April 10 for 500 concrete electric lamp standards, to cost about $17,000. Glassware for same, to cost about $17,500, will be purchased at a later date.

TRENTON, MO.—Bids will be received by Burns & McDonnell, Interstate Building, Kansas City, Mo., engineers, until April 3 for improvements to the waterworks and filtration plant, including seven new motor-driven pumps. The cost is estimated at $175,000.

CHANUTE, KAN. — Improvements are contemplated to the municipal electric light plant, including the installation of an additional 1,000-kw. turbine generating unit and accessories. C. F. Stout is superintendent.

COTTONWOOD FALLS, KAN. — The Inter County Electric Company contemplates extending its transmission lines to Elmdale. W. W. Austin is president and manager.

SALINA, KAN.—The Salina Light, Power & Gas Company has issued $950,000 in bonds, part of the proceeds to be used for extensions and improvements.

## Southern States

FAYETTEVILLE, N. C.—Bids will be received by the Public Works Commission until April 5 for electrically operated pumping machinery for the municipal waterworks and sewerage plants. W. C. Olsen, Kinston, is consulting engineer.

NEWBERN, N. C.—The installation of two additional boilers in the municipal electric water and light plant is under consideration. F. G. Godfrey is manager.

ROANOKE RAPIDS, N. C.—Preliminary plans are being prepared by the Roanoke Rapids Power Company for the construction of a hydro-electric power plant, to cost $200,000.

WARSAW, N. C.—Extensions are contemplated to the municipal electric light and power plant, including the installation of a 150-kva. alternator with exciter and uniflow engine. Line extensions are now being made. William P. Kennedy is superintendent.

WESTFIELD, N. C. — Plans are being considered to establish an electric power plant for commercial service. T. T. Joyce is interested in the project.

WORTHVILLE, N. C. — The Leonard Cotton Mills, Inc., contemplates doubling the capacity of its mills, now 5,000 spindles, and installing electric equipment in the present power plant.

CONWAY, S. C.—The Quattlebaum Light & Ice Company contemplates the installation of a 500-kw. turbine or engine-driven generating unit. Paul Quattlebaum is president and manager.

GREENWOOD, S. C.—The Grendel Cotton Mill Company contemplates the construction of a power house in connection with proposed extension to its mill, to cost about $500,000.

PAMPLICO, S. C.—The Wagoner Lumber Company plans to rebuild its power house and mill, recently destroyed by fire, with loss of about $55,000.

WADLEY, GA.—The city officials are considering the purchase of equipment for a municipal electric power plant, to include a 90-kw. generator, 100-hp. steam engine and auxiliary apparatus. F. T. McElreath is deputy clerk.

TARRANT CITY, ALA. — The Creher Shipbuilding Company, Tampa, Fla., plans to build a power house in connection with a local steel fabricating plant.

CHARLESTON, MISS.—The commissioners of the municipal electric plant are considering the purchase of one 60-hp. to 80-hp. oil engine or oil burners for the municipal electric plant. J. M. O'Neal is clerk.

NEWARK, ARK.—Plans are under consideration for the rebuilding of the electric light and power plant, recently destroyed by fire.

BASTROP, LA.—The Yellow Pine Lumber & Paper Company, Orange, Tex., will build a power house in connection with its proposed paper and pulp mill at Morehouse Parish, near Bastrop, to cost about $1,500,000.

LEESVILLE, LA.—The Leesville Light & Waterworks Company, Ltd., contemplates the installation of a 50-kw., 230-volt, direct-current generator directly connected to a simple or uniflow steam engine. W. K. Ferguson is manager.

MELVILLE, LA. — Arrangements are being made to install a complete new electric generating unit in the municipal electric plant and to overhaul the old unit. V. O. Jackson is superintendent.

PONCA CITY, OKLA.—Plans are being prepared for extensions to the municipal power plant, including the installation of additional machinery. A. M. Stalnaker is engineer.

CUERO, TEX.—The Cuero Light & Power Company has appropriated $120,000 for the installation of a 1,500-hp. power plant.

## Pacific and Mountain States

KETTLE FALLS, WASH. — The White Pine Sash Company, Spokane, will build a power plant in connection with its proposed local mill. G. W. Horstkotte, Mohawk Building, Spokane, is engineer.

PASCO, WASH.—Surveys are being made by the Pacific Power & Light Company for the erection of a high-tension transmission line from Pasco through Umatilla to Pendleton, Ore., to cost about $300,000.

H. H. Schoolfield, Portland, is chief engineer of the company.

SEATTLE, WASH.—Bids have been received by the Board of Public Works for the purchase of sites for two new substations for the distribution of energy from the hydro-electric plant at Cedar River and a portion of the Skagit plant.

TACOMA, WASH. — An ordinance has been introduced in the City Council for the purchase of the following electrical supplies: For transformers, $112,000; electric light meters, $75,000, and for ornamental street lamps and posts, $12,000.

FLORENCE, ORE.—The Florence Electric Company is planning to build a hydro-electric plant on Sweet Creek. Extensions of its transmission lines to Mapleton and in other directions are also under consideration.

PORTLAND, ORE.—Contract has been awarded by the Northwestern Electric Company to Parker & Banfield for the construction of the second unit of its steam generating station at the foot of Lincoln Street, which will double the capacity of the plant. In addition the 66,000-volt transmission line will be extended into Vancouver, Wash., to connect with the 11,000-volt line on the Oregon side of the river. The company will also build new substations and will erect additional distribution lines. The cost of the work is estimated at about $500,000.

CARPINTERIA, CAL. — The Southern California Edison Company plans to construct a local substation, to cost about $60,000.

FULLERTON, CAL.—The Southern California Edison Company has arranged an appropriation of $300,000 for extensions and improvements to its system in this section.

INDIO, CAL.—The Interlocking Tile & Sewer Pipe Company, Ontario, Cal., contemplates the construction of a power house in connection with a local plant.

LONG BEACH, CAL.—The Southern California Edison Company contemplates extensions to its system in the Long Beach-San Pedro district involving an expenditure of $1,708,000. Of this amount $1,000,000 will be expended in the High Sierras and for transmission lines to bring energy into this district; the remainder will be used for extensions to transmission lines, erection of new feeder lines, underground construction, improvements to street-lighting system, etc.

LOS ANGELES, CAL.—The Pan-American Petroleum & Transport Company, 120 Broadway, New York, is preparing plans for a power plant at its proposed oil refinery at San Pedro Harbor, to cost about $1,500,000.

MARE ISLAND, CAL.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until April 17 for 104,000 ft. of electric wire for use at the Mare Island Navy Yard (Schedule 645).

MODESTO, CAL.—The Modesto Irrigation District has appropriated $298,400 for the construction of an electric transmission system.

PORTERVILLE, CAL.—The Pacific Gas & Electric Company has appropriated $690,000 for the construction of substations and transmission lines in this section.

SACRAMENTO, CAL.—At an election to be held July 2 the proposal to establish a municipal hydro-electric plant for the city of Sacramento will be submitted to the voters. The cost is estimated at about $8,000,000.

SALIDA, CAL. — Plans are being considered by the Salida Welfare Association for the installation of a lighting system.

SALINAS, CAL. — Extensions and improvements are contemplated by the Coast Valleys Gas & Electric Company, including changing 20 miles of 30-kv. volt line from Soledad to King City to 55 kv., replacement of thirteen 30-kv. station transformers with 55-kv. transformers of 500 kva. each., installation of a new substation at Salinas and the erection of approximately 25 miles of 4-kv. feeder lines. T. W. Snell is superintendent.

SAN BERNARDINA, CAL. — The San Gorgonio Power Company has appropriated $450,000 for the construction of two hydro-electric power plants at Banning and Beaumont respectively.

SOLVANG, CAL.—Plans are being considered for the installation of a municipal power plant and system.

TEHAMA, CAL.—Plans are being prepared by Ralph W. Van Orden, Mills Building, San Francisco, engineer, for a local hydro-electric power plant with capacity of 18,600 hp., to cost about $2,500,000. A company is being organized by P. B. Cross and associates to construct and operate the plant.

TORRANCE, CAL. — The Union Tool Company will build an addition to its power plant in connection with factory extensions.

UKIAH, CAL.—Steps have been taken by the Chamber of Commerce for the installation of an ornamental lighting system in the business district.

GRANGEVILLE, IDAHO.—Surveys are being made by the Grangeville Electric Light & Power Company for a hydro-electric plant on the North Fork of Clearwater River to develop about 4,000 hp., and the erection of a transmission line to Orofino.

PHOENIX, ARIZ.—The Riverside (Cal.) Portland Cement Company plans to build a power house in connection with its proposed cement mill, to cost about $1,000,000.

## Canada

WINNIPEG, MAN.—B. W. Parker, Winnipeg, has applied to the City Council for a franchise to construct and operate a central heating plant in Fort Rouge. Mr. Parker proposes to install a heating plant equipped with an electrical steam generator and also to form a company to operate the proposed plant.

ST. JOHN, N. B.—The Federal Light & Traction Company, 52 William Street, New York, it is reported, contemplates extensions and improvements to the system of the New Brunswick Power Company, recently acquired.

RIDEAU, ONT. — The Hydro-Electric Power Commission of Ontario, Toronto, contemplates improvements in the Rideau system, to cost about $20,000.

MONTREAL, QUE.—The Electric Commission contemplates the installation of conduits in district No. 10, bounded by Craig, Bleury, St. Catherine and St. Lawrence Streets. The cost is estimated at about $150,000. A. Larivière is chief engineer.

MONTREAL, QUE.—H. Morgan & Company contemplate erecting an addition to their store on St. Catherine Street, to cost about $1,500,000, and building a power house at Aylmer and Mayor Streets, to cost $200,000. Barrett & Blackard, Canada Cement Building, are architects.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued March 6, 1923)

1,447,773. RADIO TRANSMISSION CONTROL SYSTEM; L. Espenschied, Queens, N. Y., and R. Brown, East Orange, N. J. App. filed Sept. 15, 1921. Uniform transmitting level maintained.

1,447,779. SYSTEM OF ETHER-WAVE CONTROL; J. H. Hammond, Jr., Gloucester, Mass. App. filed April 10, 1920. Radio transmitting and receiving apparatus.

1,447,785. HIGH-FREQUENCY ELECTRICAL APPLIANCE; E. S. Humphreys, Cleveland, Ohio. App. filed Dec. 27, 1920. For therapeutical treatment.

1,447,792. METHOD OF WELDING WIRES OR RODS ON INTERSECTING LINES; L. S. Lachman and E. Fulda, New York, N. Y. App. filed Feb. 28, 1922. Overlapping end of rod upon edge of opposite member, the rods being assembled between a pair of welding dies.

1,447,793. RADIO RECEIVING SYSTEM; M. Latour, Paris, France. App. filed Aug. 19, 1921. Applies heterodyne action in receiving Hertzian waves.

1,447,797. RELIEF MECHANISM FOR STORAGE BATTERIES; W. P. Loudon, Springfield, Mass. App. filed April 20, 1918. Device for storage batteries used in aëroplanes or the like that allows escape only of gases.

1,447,886. PERMANENT HAIR WAVER; S. S. Rand, New York, N. Y. App. filed Aug. 10, 1920. Operated by electricity.

1,447,892. SMELTING AND ELECTROLYTIC PROCESS; R. Rodrian, New York, N. Y. App. filed March 30, 1921. For making alloys.

1,447,917. ELECTRIC SWITCH; E. M. Wilson, Sandpoint, Idaho. App. filed July 20, 1921. Electromagnetic switch for heating devices.

1,447,952. ELECTRIC RADIATOR; C. A. Head, Royal Oak, Mich. App. filed Feb. 25, 1922. Reservoir of water acts as heating element.

(Issued March 13, 1923)

15,560 (reissue). ELECTRIC DEVICE FOR TREATING AIR; E. R. Case, Toronto, Ontario, Can. App. filed March 22, 1920. Medical appliance to treat air inhaled by sick people.

1,447,969. TELEPHONE HEAD SET; F. Dietrich, Flushing, N. Y. App. filed May 12, 1922. Padded holder for receivers.

1,447,993. METHOD OF CONSTRUCTING ELECTRODYNAMIC ARMATURES; A. T. D. Libby, East Orange, N. J. App. filed Sept. 22, 1919. Method of connecting windings of automobile starter to commutator.

1,448,009. CASING FOR ELECTRICAL APPARATUS; H. O. Stephens, Pittsfield, Mass. App. filed Oct. 2, 1920. For heating apparatus submerged in liquid.

1,448,010. ARTIFICIAL MAGNESIA SPINEL AND PROCESS OF MANUFACTURE; F. J. Tone, Niagara Falls, N. Y. App. filed April 5, 1921. Magnesite and bauxite fused together in electric furnace.

1,448,036. REDUCTION OF OXIDES OF METALS OF THE CHROMIUM GROUP; R. E. Pearson and E. N. Craig, London, England. App. filed July 12, 1921. By passing direct current through mixture.

1,448,037. ELECTROLYSIS OF WATER; R. Pechkranz, Geneva, Switzerland. App. filed July 12, 1922. Water decomposer built on filter-press principle with electrodes of thin sheet metal.

1,448,040. STREET INDICATING AND ADVERTISING DEVICE FOR MOTION VEHICLES; P. Radoccia, Providence, R. I. App. filed Sept. 24, 1921.

1,448,096. STRAIN INSULATOR; L. Steinberger, Brooklyn, N. Y. App. filed Feb. 21, 1919. Single-unit type.

1,448,116. CONNECTOR FOR ELECTRICAL CONDUCTORS; R. A. Haislip, Montclair, N. J. App. filed May 7, 1920. For making a tap on a wire.

1,448,141. SUPPORT FOR CONDUCTORS; M. W. Manz and S. S. Mathews, Mansfield, Ohio. App. filed March 21, 1922. Supporting trolley wires from catenary or messenger cables.

1,448,142. BATTERY-TESTING DEVICE; J. W. Martin, San Ardo, Cal. App. filed Jan. 10, 1922. Apparatus for testing specific gravity of electrolyte in automobile batteries.

1,448,143. CONDUCTOR SUPPORT; S. S. Matthes, Mansfield, Ohio. App. filed March 25, 1922. Removable conductor support for trolley frogs, switches, etc.

1,448,190. AUTOMATIC ELECTRIC LIGHTING UNIT; W. W. Bucher, Chicago, Ill. App. filed March 2, 1916. Automatic gas-engine generator set.

1,448,195. SUPPORT FOR TROLLEY CONDUCTORS; H. P. Chandler, Mansfield, Ohio. App. filed June 3, 1922. Clamping trolley-wire ear.

1,448,207. WIRELESS-TELEPHONE RECEIVING APPARATUS; W. F. Gehrig, Newark, N. J. App. filed May 11, 1922. Mounting of tuning coil and detector devices for wireless-telephone receiving sets.

1,448,208. ELECTRODE FOR ELECTROLYTIC CELLS; J. Gerstle, Dayton, Ohio. App. filed July 15, 1922. Cathode of insulating material strung with silver wire.

1,448,216. SIGNALING SYSTEM; R. A. Heising, Millburn, N. J. App. filed July 6, 1918. Modulating and amplifying arrangement of the vacuum-tube-type transmitter.

1,448,219. SYSTEM FOR THE GENERATION AND DISTRIBUTION OF ELECTRICAL ENERGY; C. L. Hommel, Detroit, Mich. App. filed Oct. 14, 1915. Automatic gas-engine generator set.

1,448,279. ELECTRODYNAMIC RECEIVER; E. S. Pridham and P. L. Jensen, Oakland, Cal. App. filed April 28, 1920. Moving-coil type of telephone receiver.

1,448,350. TROLLEY-POLE SAFETY APPLIANCE FOR ELECTRIC TRAMS AND THE LIKE; P. M. De C. Ireland, Heidelberg, Victoria, Australia. App. filed April 9, 1921. When pole disengages from wire it automatically lowers to car roof.

1,448,353. FLASHLIGHT; E. R. Barany, Brooklyn, N. Y. App. filed Dec. 21, 1921. Several lamps and reflectors held in one case and focused at same point.

1,448,354. FLASHLIGHT; E. R. Barany, New York, N. Y. App. filed Dec. 21, 1921. Arrangement to locate reflector properly.

1,448,367. FITTING FOR ELECTRICAL CONDUITS, CABLES AND THE LIKE; G. C. Thomas, Jr., Elizabeth, N. J. App. filed May 11, 1922. For protecting wires entering outlet box.

1,448,377. CURRENT-COLLECTING DEVICE; C. Bethel, Wilkinsburg, and T. S. Scott, Pittsburgh, Pa. App. filed July 5, 1922. Brush holder for electric railway motors.

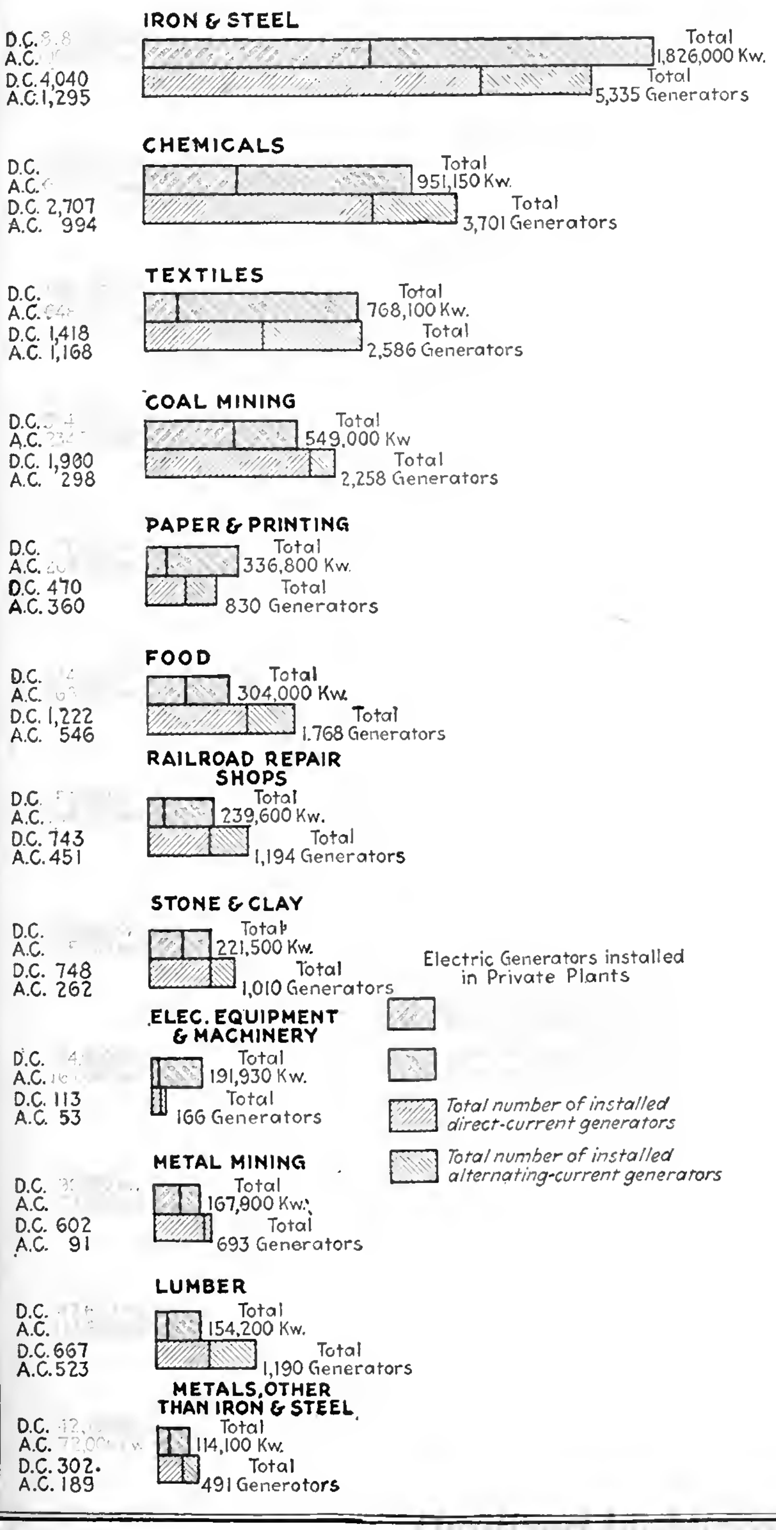
1,448,378. CURRENT-COLLECTING DEVICE; C. Bethel, Wilkinsburg, and T. S. Scott, Pittsburgh, Pa. App. filed July 5, 1922. Brush holders for electric railway motors.

1,448,380. REGULATOR FOR REGENERATIVE CONTROL SYSTEMS; C. A. Boddie, Wilkinsburg, Pa. App. filed Sept. 11, 1920. Railway-motor regeneration.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for the Use of All Interested in Analyzing the Trend of the Electrical Business

### Installed Electric Generators in Private Plants Total 6,130,710 Kw.



## The Breadth of the Field for Future Electrification

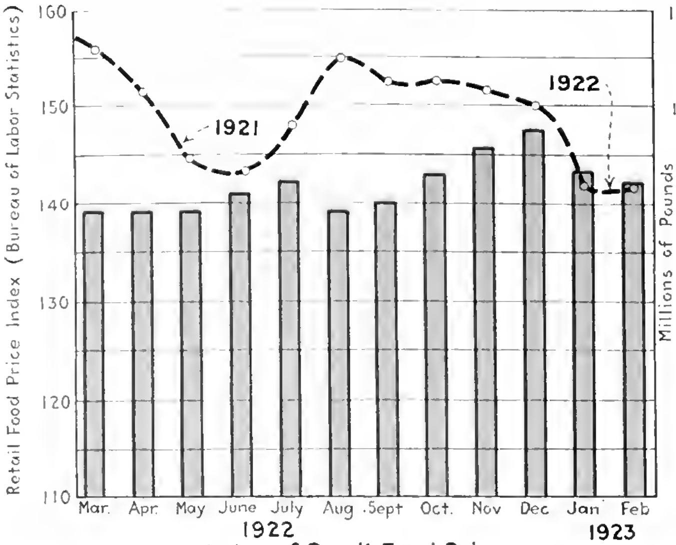
THE electrical industry as a whole is, perhaps, most interested not so much in the past growth and present status of the electrification of industry as in the length and breadth of the field for future electrification. The growth of the lighting load is, of course, dependent largely upon the new residential and office-building construction, although the wiring of old residences will continue to serve as a reservoir for new load for several years to come.

Turning to the future increase in power load, we find two sources of growth. First is the conversion of steam drive to electric drive. The present unelectrified industrial power in the United States totals about 16,000,000 hp. It is probable that as regards a large portion of this primary power electrification is impracticable, but the portion for which future electrification is practicable is of such proportions as to attract the new-business departments of the central-station companies.

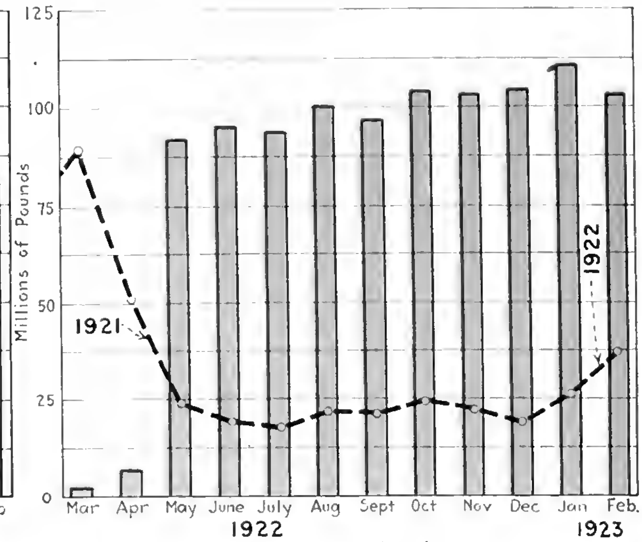
The second source of future growth in the central-station industrial load lies in the factories and mines which are at present electrified from generating plants owned by the manufacturing and mining companies. Low cost, dependability and freedom from responsibility are the arguments which will cause the private generating plants to cease operations and central-station power to be substituted.

It is, of course, too much to assume that in course of time all industry will be electrified, but, notwithstanding this fact, a large field for future industrial power growth is open to the central station.

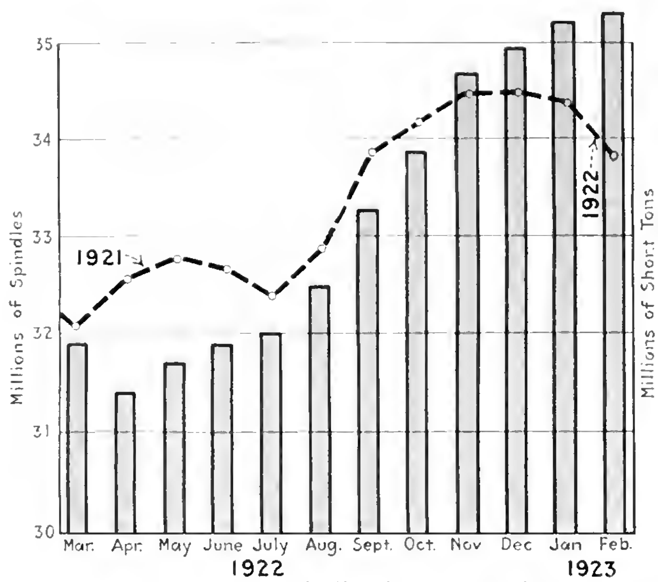
## How the Primary Industries Are Trending



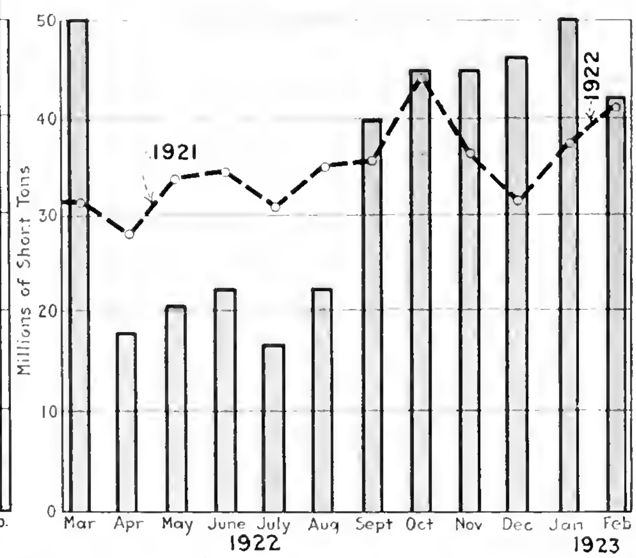
Index of Retail Food Prices



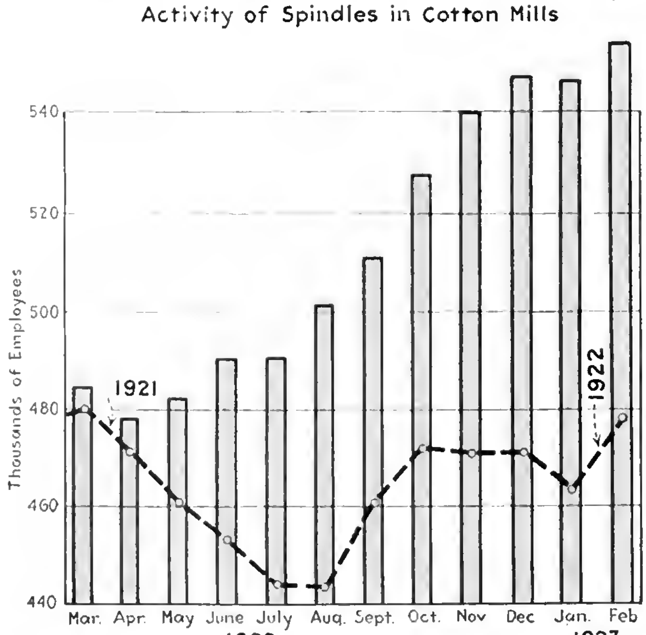
Copper Production



Activity of Spindles in Cotton Mills



Bituminous Coal Production



Employees in Factories of New York State

## A Conservative Attitude Dominates General Business

PRODUCTIVE activity was maintained in February at the high levels reached during January. The Harvard University Committee on Economic Research sums up the present situation as follows: "The prospect of higher prices and expanding business has, strange to say, generated not a little pessimism, a circumstance which indicates that business men have not yet forgotten the lessons of 1919 and 1920. Fear of a 'buyers' strike' is holding down prices of consumers' goods, and inventories of industrial concerns are being examined with care. Doubtless there is not a little hesitation on the part of business men to make commitments at the higher level of prices, but this is not a bad sign in the present phase of the business cycle. So long as a conservative attitude dominates the general business community, the prospect of continued healthy advance remains."

# Keep the Public Thinking Constructively

PEOPLE think and people talk. Opinions are formed and opinions are exchanged. And among the subjects in the public mind today public utilities and engineering in general are both prominent. This being the case, it is essential to the advancement of utility service to the public and it is invaluable to the general usefulness of engineering that the public be provided with proper facts so that thoughts and words may be based on truth and not conjecture.

Too often are public utilities and too often are engineers ineffective, hesitant or even backward in telling the truth about their services to the public. The wily and knowing politician is not so hampered and often rides to office on arguments accepted by a misinformed public to its own ultimate detriment. Yet there lies within the power of the utility the same strong weapon used by the politician —publicity—and it should prove the more effective when it is used to tell the truth.

The utility story fairly, fully and frequently told is the best preventive political medicine known. It is worth while telling all the time, continuously and consistently. A public which thinks correctly is much more likely to act correctly when the time to act arrives than one which is either uninformed or misinformed. The human mind is constantly at work, and it is both useful and legitimate to feed it facts upon which to chew.

# Henry Duvall James

*An executive engineer who has contributed largely to the development of industrial control apparatus.*

IN THE industrial applications of electricity a necessity arises so to control the energy or the electrical machines that maximum speed in production and safety to operators will result. One of the younger engineers of the industry who has attained leadership in this type of work and who devotes his energies enthusiastically to further developments in all lines of control is H. D. James. He organized the control engineering department of the Westinghouse Electric & Manufacturing Company and has been and is the first and only manager of this department. He has received about one hundred patents on control systems and has been a prolific, authoritative writer on phases of control, both in the technical magazines and as the author of a book entitled "Controllers for Electric Motors."

Mr. James was born in Baltimore on Sept. 21, 1874, and was graduated from the University of Pennsylvania in 1895, receiving the degree of bachelor of science and a year later the post-graduate degree of mechanical engineer. Soon after his graduation Mr. James entered the employ of the Otis Elevator Company, working at times in Yonkers, N. Y., New York City and Pittsburgh. In this service he received some of his first training and experience with control apparatus. He entered the employ of the Westinghouse Electric & Manufacturing Company on Feb. 1, 1904, and has been with it continuously since. In 1909 he assisted in the organization of the general engineering department of the company and seven years later in the organization of the control engineering department, which up to that time had been a division of the general engineering department. He was appointed manager of the new department in recognition of his efforts and his qualities of leadership. In 1919 he also assisted in the reorganization of the entire sales department of the Westinghouse company.

Mr. James' ability has been recognized by his associates in the electrical industry, as has been evidenced by the fact that he was elected last winter to the presidency of the Engineering Society of Western Pennsylvania, this honor coming to him after he had spent three years as a director and two years as vice-president of this organization. He was also chairman of the sub-committee of the Electric Safety Conference that drew up the safety standards for control apparatus, is chairman of the Control Section of the Electric Power Club and chairman of the industrial power committee of the A. I. E. E. He is secretary of the Westinghouse Club and one of the original fellows of the A. I. E. E.

## What Can the Consumer Afford to Pay for Electric Service?

SCANT sales of electrical energy will be made to residential customers so long as electric service is sold as a necessity. But there is no definable limit to the individual's expenditure for those things which tend to make life more livable and enjoyable; and the more the sale of electric service for the convenience and pleasure of the customer can be made the guiding principle in central-station residence sales, the more valuable will the residence consumer become as a customer.

It is only in recent days that the residential customer has been considered much more than a user of some light and some appliances; and it is rare to find a central-station commercial organization that visualizes its residential customers as customers are visualized by the automobile industry and by many other commercial concerns that emphasize convenience, style, comfort and luxury as well as utility and necessity. That lighting is still considered the principal home use of electricity is shown by the fact that the average residential bill is still under $30 per annum! Two central-station managers recently even declared their customers extravagant, though there were no abnormal bills—there was merely a rather unusual number of appliances and large-sized lamps were used! The consumer realized the comfort and luxury value of electric service whether the central-station man did or not. These customers had their automobiles and other modern comforts and considered electric service in the same class.

Naturally no definite answer can be made as to what proportion of his income the average consumer should pay for electric service. But a careful analysis of what most consumers can afford to spend with the central station for the improvement of their living conditions will reveal surprising possibilities. A little more imagination on the part of the central-station commercial man will lead both to better business and to better good will toward electric service.

## Keeping Contact with Power Customers

EVERY time a new power customer is obtained a potential source for good or bad public relations is created. Servicing central-station power supply is just as essential as servicing appliances, but there are some critical dissimilarities in the personnel and methods needed for obtaining the same results in the two cases.

In general some high-grade sales engineer has convinced the power customer that he is following a path pointed to by both economic and engineering considerations when he signs a contract for central-station service. Too frequently the existing operating force of the power customer's installation of engines and boilers has not been "sold," and in such cases it remains to oppose and obstruct or is summarily dispensed with, leaving the power customer with no engineering staff. In other instances, even when the existing power engineering staff is "sold" on central-station service, the type of engineering work necessitated under new operating conditions imposes on it a handicap which often leads to trouble and ill feeling.

To offset and prevent such conditions the central-station power salesmen are finding it necessary to act as advisory engineers to the large power customers and to afford them "standby" engineering service. As an organization efficiency move and to bring sufficient technical skill to bear, several companies maintain a small sales engineering force to keep and maintain specialized contact with power customers. One man will handle steel mills, another machine shops, still another large elevator apartments. Many direct advantages result from this practice in the way of obtaining more power load, better power factor and better operating practice, but the indirect advantages of the practice are even more valuable. No surer way exists for maintaining good relations with influential industrial groups and with the engineering personnel outside the central-station organizations. So evident has this become that the practice adopted by some central-station organizations is being widely accepted by others. If the maximum results are to be obtained, the personnel of the advisory staff must be of a high grade and technically competent.

## Electrical Contractors to Be Guided by a Commissioner

THERE are times in the affairs of nations as well as of men when it becomes expedient to place the destinies of the nation or of men in the hands of a single individual. Cabinets or boards are not so expeditious or so efficient, and in not a few instances experience has shown them to be long and narrow and to be composed of wood. A competent individual clothed with the requisite authority and power can bring order out of chaos more quickly, and if he be wise and prudent can couple satisfaction with order and sometimes do much to insure contentment and happiness for a nation or a people.

Taking a leaf out of history, modern business, too, when faced with crises, schisms or dilemmas, now turns to a single individual for guidance or chastisement. Thus baseball has its Landis, the motion-picture industry its Hays, the stage its Thomas, the garment center its Mosessohn, and now the electrical contractors of Greater New York are to have their Eidlitz. For causes too numerous to record, reputable contractors of the metropolis doing an annual business of approximately fifty million dollars have found their occupation becoming unprofitable and rapidly losing every vestige of good will. It will be Mr. Eidlitz's job to rectify this situation. There is no doubt of his competency;

he was the organizer and the first president of the National Electrical Contractors' Association and has been singularly successful in the electrical contracting field. His colleagues have certainly shown great confidence and faith in his ability by voluntarily asking him to serve as the commissioner for them and agreeing to place all their records before him and abide by his decisions. All who are acquainted with the electrical contracting conditions in the Greater City and who know Charles L. Eidlitz will commend the choice. The only way in which he can enforce his decisions is by moral suasion, and while time and experience alone can reveal how successful Mr. Eidlitz will be in exercising his functions as commissioner, he at least begins his labors with the confidence and well wishes of the industry. If the arrangement does not work out well, the fault will not be his. He possesses courage, initiative and an intimate and practical knowledge of the business, and he has reached the age when passion and prejudice will not sway him and where he can be influenced only by what is right and just.

## Take Steps to Give Code Changes Status of American Standard

THE National Electrical Code, changes in which were recently adopted by the electrical committee of the National Fire Protection Association, is essentially a standard of electrical construction, installation and operation, according to which insurance companies judge the insurability of electrical equipment or of buildings in which electricity is used. It has been compiled by the electrical committee and is administered by insurance inspectors, municipal and state inspectors.

In the past the electrical committee has revised the code biennially, after suitable public hearing, and the recent revision was made in this way. But meanwhile the code itself was adopted, by due procedure, as an American standard by the American Engineering Standards Committee, which has a very definite procedure for revisions of its standards. There is now therefore the anomalous, though in this case natural, condition of an American standard code containing revisions which are not American standards. It surely appears that it would be most advantageous to take immediate steps to give the new revisions official status. This could be done practicably, it seems, by some action which would in effect make the present electrical committee, with slight modification, serve as the necessary sectional committee under appropriate sponsorship. The present electrical committee is composed of representatives of the following associations: American Electric Railway Association, American Institute of Electrical Engineers, Associated Factory Mutual Fire Insurance Companies, Association of Electragists International, National Association of Electrical Inspectors, National Board of Fire Underwriters, National Electric Light Association and the United States Bureau of Standards, and representatives of the inspection bureaus of some of the large cities of the country and of certain other interested bodies. This looks like a good foundation for building a sectional committee, and if modifications are made permitting better balance between men who represent electrical associations and insurance men, so that it will be more apparent that the electrical industry itself bears the principal burden of the preparation of the code, such a committee should be fully qualified and should have the full confidence of the industry. In short order the latest changes would be made changes in the American standard and present and future code work would receive an even higher status both legally or strategically and in the estimation of those who conduct their operations according to its precepts. It is to be hoped that some organization will immediately take proper steps to bring this officially to the attention of the American Engineering Standards Committee.

## One-Million-Volt Laboratories

PROGRESS in any art is dependent on discovery, which in turn is dependent on experiment and scientific investigation. This is particularly true of the art of electrical engineering, in which the underlying laws are not visible in their operation, but only in their results, and in which new laws are being uncovered almost daily. The promise of results from study and investigation in such a field is therefore immediately obvious. But this promise has not always been generally recognized. The early history of the development of electrical machinery reveals clearly the intimate relation between improvement and foregoing experiment. There followed, however, a long period in which investigation was practically limited to the technical development of machinery embodying a few great underlying principles, such as the generation of electromotive force by electromagnetic induction, leading to the continuous and alternating current generators and motors and their extension into the simpler problems of transmission. Investigation in this period was generally of the cut-and-try type, the finding of some new material or method of design that would work a little better. In fact, nothing more was needed. The field opened by the successful production of generators, motors and the incandescent lamp was so wide that manufacturers had all they could do to supply the market and improve the efficiency and reliability of existing types.

The change came with the wider demand for the benefits of electric service and the necessity for long-distance transmission. This immediately emphasized the limitations of our knowledge of the number and variety of electrical laws and of the phenomena involved in the transmission of both intelligence and power. At first the tendency was to stick to the old method of empirical effort in solving these new problems. As time went on, however, the inadequacy of this policy was seen, and the importance—in fact, the necessity—of calling upon the best type of scientific investigation was recognized. Laws must be understood before the properties of materials in relation to these laws can be intelligently studied and utilized.

This truth once realized has spread apace, so that now the most elaborate research laboratories are to be found in the manufactories rather than in the universities, their original homes. The industries are voicing the importance of research with great emphasis and are expending large amounts not only in equipping laboratories but in maintaining them in active operation under experts in various fields. In one electrical laboratory of this type the number of employees engaged solely in research reaches well up into the hundreds. The magnitude of the investment placed in these undertakings, which is evidence of the importance attached to scientific research by the management, is indicated by the description of the new high-voltage laboratory of the Westinghouse Electric & Manufactur-

ing Company printed in the ELECTRICAL WORLD this week. This is only one phase of the research work of this company, yet its importance evidently justifies a separate laboratory, covering considerable ground area, special railroad connection and loading facilities, elaborate protective and control devices for the electrical equipment, independent motor-driven generators entailing a total substation capacity of 3,000 kva., liberal provision in the way of clearances, oil tanks, piping, driers, etc., for all types of high-voltage testing, and finally two testing transformers for 1,000,000 volts and 500,000 volts respectively. Of special interest are the several methods provided for the accurate measurement of these high values of voltage and the principles followed in designing the high-tension insulation of the transformers.

At first thought one wonders what, with transmission voltages at a temporary standstill at 220 kv., are the special purposes of these elaborate preparations for study in a field so far beyond the apparent maximum of present practice. The answer is that provision is being made not merely for the testing of insulators, but for the study of laws and the properties of materials in ranges well beyond those of practice, so that reliability against unknown dangers may be provided, efficiency of operation improved and new laws uncovered, and possibly even in anticipation of transmission voltages still higher than any yet mentioned.

## The Graphic Design of Illumination

SINCE scientific lighting became familiar, numberless efforts have been made to reduce the design of illumination in any given working space to the simplest possible terms. The methods of attack on this problem have in general been two—one the method based on the flux of light within the space as a whole and with the introduction of such modifying factors as might be necessary, the other a simplification of the old point-by-point reckoning with the intensity and polar graph of the source as a base. The experience of engineers has long ago shown that each of these methods has merits in particular cases. It has disclosed further the fact that both methods must in a good many instances be supplemented by intelligent judgment or computation. The concrete problem which the illuminating engineer has to face is not the illumination of a space of given dimensions but the illumination of a space of given dimensions devoted to particular specified uses—a final requirement which alters the situation very materially.

A good example is found in the report on the lighting of post offices which we published March 24. Here it has to be taken as one of the fixed conditions of the problem that the illumination must be at a sufficient working intensity for both horizontal and vertical planes and for conditions of visibility by no means normal in other clerical work. This matter aside, it is certainly convenient to have both the flux and the intensity method developed in the simplest feasible way, and the charts devised and explained by Emil Kun, which we publish this week, will afford for certain cases relief from serious computations. The object of the method is to take a short cut to the long series of the point-by-point method through the introduction of a primary plane of lighting determined in the conventional way from the polar curve or actual performance of a typical lighting unit, and then to pass graphically in a way that is clearly explained to the lighting on other and secondary planes that may be necessary for reckoning the whole equivalent illumination. As the reckoning starts from the polar curve of a typical luminaire, or the actual results obtained from it, and then passes to the illumination on one or more planes, the graphic method may be reversed to determine the height of fixture or necessary intensity from the illumination at the primary and secondary planes concerned. Methods of this sort are not infrequently convenient and furnish a useful check on computations made in other ways.

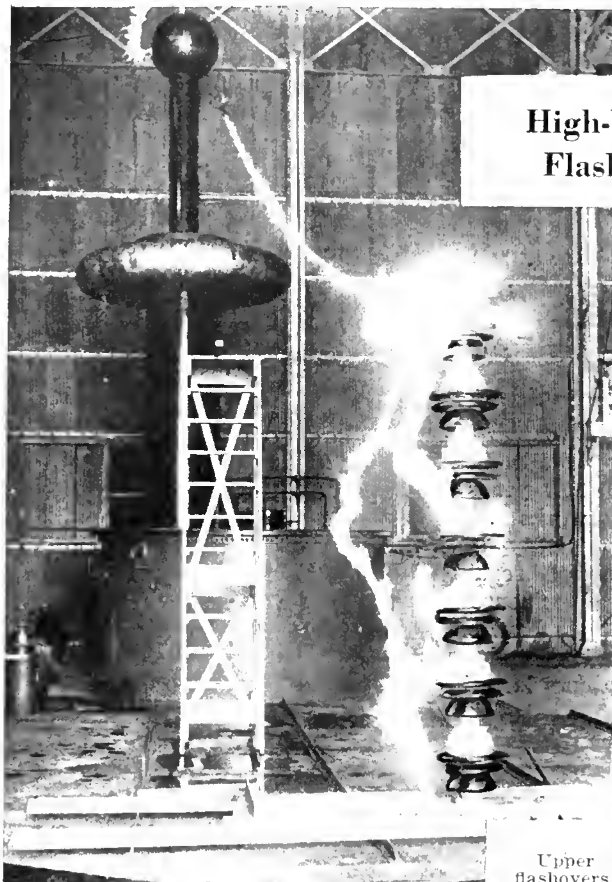
## Making the Most of the Calculating Table

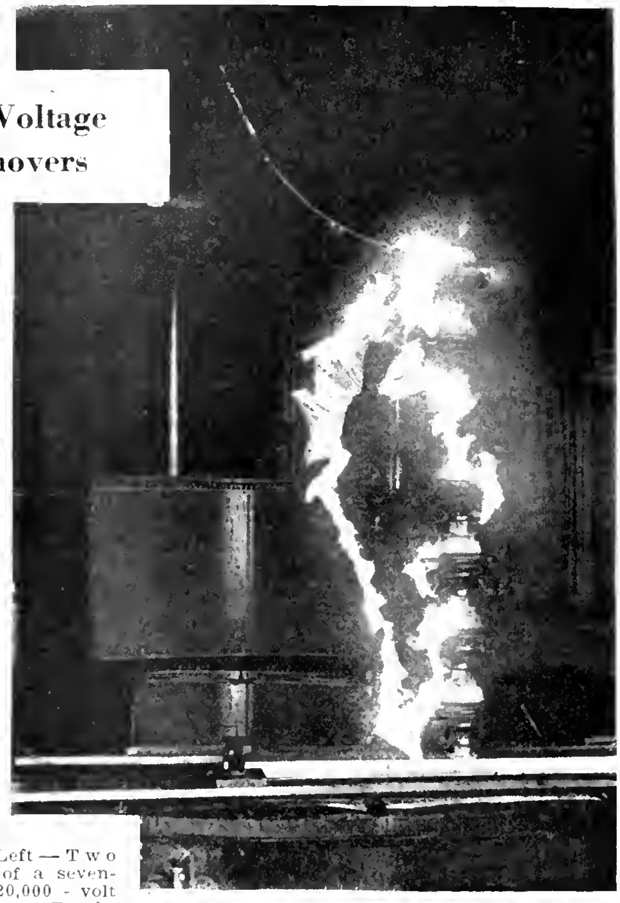
FEW devices have contributed more during the last few years to operating refinement in transmission networks than has the calculating table. Through its use relay settings have been made more accurate, circuit-breaker duties have been more closely defined, and immense labors in the computation of short-circuit values have been reduced to comparatively easy manipulations and tests of electrical system models. These results have been attained at relatively low cost where "home-made" tables have been designed for a particular system, and this is a strong argument for the wider application of this method of analyzing transmission problems.

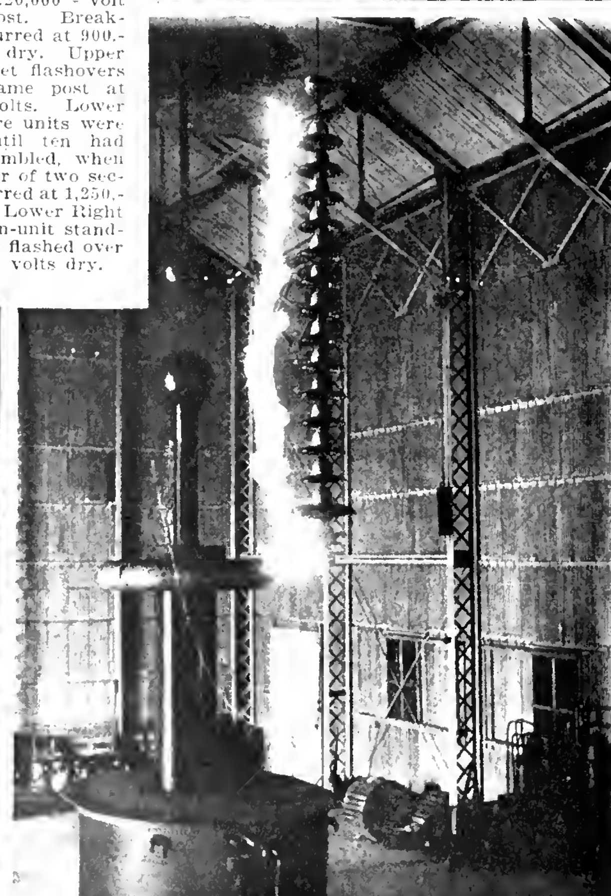
Elsewhere in this issue E. W. Dillard describes the use of a calculating table on the system of the New England Power Company. In this case the table was designed for the particular system using it, so that the flexibility that is characteristic of tables adaptable to any system layout was omitted to save unnecessary expense. Structural simplicity marks the Worcester table and accessories, but these are sufficient to enable careful studies to be made of proposed extensions or changes in lines, transformers and generating stations in relation to the existing network. The company's engineers are to be congratulated upon their solution of the problem of providing an outfit so well combining compactness and simplicity with adequacy for determining short-circuit currents and the requirements of relay operation at any desired point on the system.

Interesting as such devices are to the engineer, there remains the natural query of the executive, "What have they actually accomplished?" Mr. Dillard shows that the solution of the important problem of relay setting has been made much easier by this means and that, as a result of the analysis, the amount of energy to be handled by various circuit breakers has been decreased, thereby contributing to more reliable service and postponing the replacement of earlier installed designs of oil switches. During low-water conditions the company is sometimes obliged to shut down a large part of its hydro-electric equipment, but since this shutting down must be limited by the number of machines required to furnish sufficient energy for relay operation, accurate information as to relay settings is most valuable. More satisfactory knowledge of circuit-breaker requirements in extensions and changes is also available through table tests. All this spells economy of plant investment and efficiency in operation and suggests the value of this method of investigation to far less complex systems than that of the New England Power Company and its interconnected lines.

# High-Voltage Flashovers







Upper Left — Two flashovers of a seven-unit 220,000 - volt switch post. Breakdown occurred at 900,000 volts dry. Upper Right—Wet flashovers of the same post at 650,000 volts. Lower Left—More units were added until ten had been assembled, when a flashover of two seconds occurred at 1,250,000 volts. Lower Right—A fifteen-unit standard string flashed over at 850,000 volts dry.

# Complete Million-Volt Laboratory—Part I

A Thoroughly Equipped Experimental Station Devoted Exclusively to Research Problems in the Use of Very High Voltages and Which Includes a Single-Unit 1,000,000-Volt Transformer

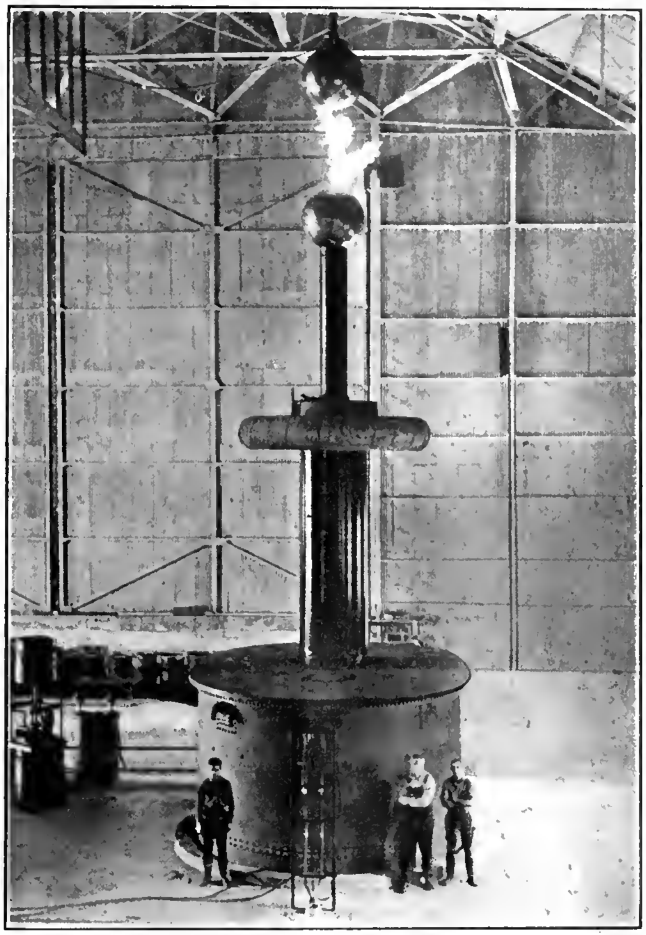
By J. F. PETERS and D. F. MINER
*Engineering Department, Westinghouse Electric & Manufacturing Company*

INDUSTRIAL progress of towns, states and whole nations has become largely dependent upon electric power made low in cost and instantly available. In the United States, because of its great natural resources, large electric systems have grown in capacity and territory served, making available enormous power for electric transportation and development of industries.

Apparatus built for these systems, the voltage of which has climbed higher and higher as economy in transmission of the greater blocks of power has dictated, must be made far more reliable than was necessary when small isolated systems dotted the country. Test voltages for existing apparatus must be provided up to approximately 700,000 volts. Suspension insulator strings, which have sufficient insulation under severe storm conditions for the present 220,000-volt systems, will have a dry flashover voltage around this value. While there is no immediate prospect of need of transmission-line voltages much in excess of 220,000 volts (127,000 volts to grounded neutral), testing facilities for research studies must always be kept far in advance of actual practice.

There is urgent need of thorough investigation of high-voltage problems to obtain data upon which engineers may with confidence design apparatus for installations the magnitude and voltage of which may exceed our present upper limit. These may be demanded sooner than we anticipate. Furthermore, we need information which will help in the solution of difficulties which arise at times in the operation of the present systems.

Because of the expense involved in providing necessary special equipment and maintaining a competent corps of experts, the larger electrical corporations are at present the only ones especially fitted for carrying on this work. Without the expectation of immediate returns, they may spend large sums for these investigations, knowing that the results will ultimately be applied to future equipment to be manufactured. The Westinghouse Electric & Manufacturing Company, early identified with research in high voltage engineering, has, in line with this policy, built and equipped a large laboratory exclusively devoted to high-voltage research and development.



COMPLETE MILLION-VOLT TRANSFORMER, BUSHING AND SPARK GAP WITH A FLASH OVER THE GAP AT 1,200,000 VOLTS

The main laboratory, having a floor space of 110 ft. x 120 ft. and isolated from near-by shop buildings, is equipped with two testing transformers, one for 1,000,000 volts and the other for 500,000 volts. In addition, two large oil tanks with auxiliaries are provided, one for tests of insulation under oil and the other for rain tests of bushings and similar apparatus. The building is so constructed that a clear space of 50 ft. exists from the floor to the lower chords of the truss, giving an unobstructed volume (110 ft. x 120 ft. x 50 ft.) and affording plenty of clearance for the very high potentials used.

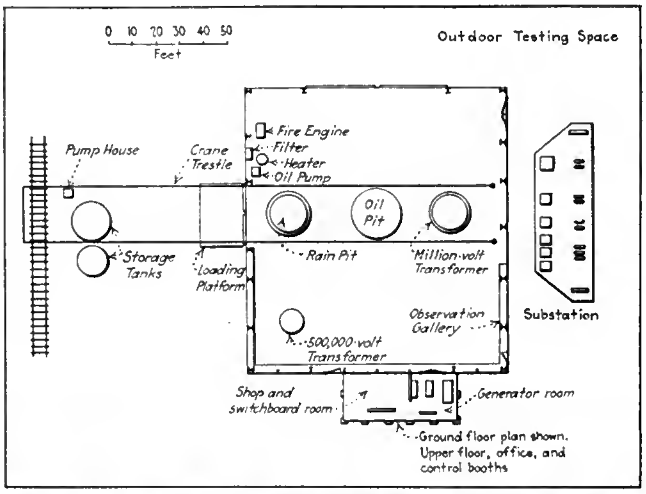
Attached to one side of the main building and partly separated from it by a glass partition is the operating and control building. On the ground floor of this structure the generating equipment, low-voltage switchboards and work shop are installed. On the upper floor are the two transformer operating booths, remote breaker control bench and the office.

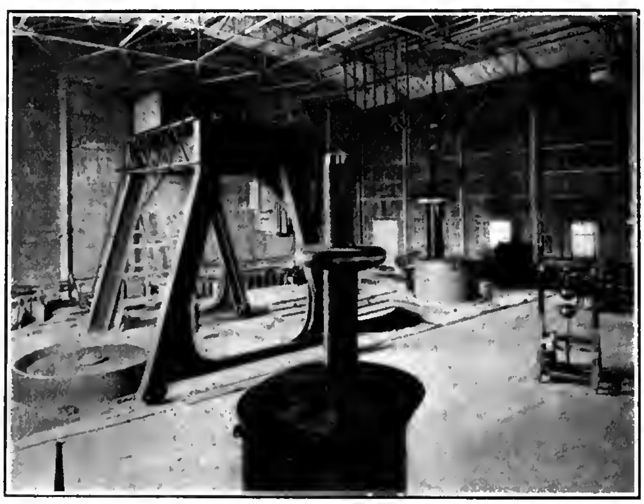
Adjacent to the building, a substation, with the necessary circuit breakers and supply transformers, has been constructed.

On the side of the building opposite the control room two sliding doors may be opened, giving a space 45 ft. x 60 ft., through which high-voltage lines may be taken for outdoor tests.

The question of material handling, so important in industrial plants, offered special problems in this laboratory, for it was desirable that proper facilities be provided for bringing in and setting up apparatus under test, which is usually of considerable size, and for re-

pairs or additions to permanent equipment. For this reason the two large tanks and the million-volt transformer were placed in pits sunk in the floor on a line through the middle of the building. These pits are straddled by a gantry crane of 35 tons capacity with a 5-ton auxiliary. The crane track passes out of the building through a double door, 25 ft. x 45 ft., to a concrete loading platform, and from there out on a trestle over a siding of the Pennsylvania Railroad





INTERIOR VIEW OF THE LABORATORY AND GENERAL LAYOUT; 500,000-VOLT UNIT IN FOREGROUND

tracks. Inside the building transfer at right angles to the crane track is accomplished by means of an electric monorail trolley hoist.

The history of high-voltage testing transformer development shows a progress by steps, keeping pace with improvements in insulation. When the limit of voltage capable of being produced in a single unit was reached the next step was to use two or more transformers in series. When further progress in insulating structures came a return to the single unit was made. This cycle has been traversed several times. In 1891, when potential transformers had reached a limit, a set using several units in connection with an insulating transformer was constructed by C. E. Skinner and C. F. Scott. The next cycle was completed in 1913 by the Westinghouse company, when two 500,000-volt transformers were connected with the common point grounded to produce 1,000,000 volts. During recent years the use of several units in cascade has been advocated, and now again a single unit has been possible.

The present million-volt transformer built by the Westinghouse company represents a real advance in the art brought about by the construction of a single unit for the total voltage. The advantages gained by this construction, involving as it did the solution of serious problems of insulation efficiency and careful stress distribution, are saving of space, convenience of operation and accuracy of voltage measurement.

The new million-volt single unit utilizes insulating space at such efficiency that the whole transformer is not materially larger than an older unit for half the voltage. The new principle, in a word, is the adoption of coils increasing in size and voltage radially instead of axially. The first high-voltage coil starts at ground potential and need not be heavily insulated from the core. Each succeeding coil is at a higher potential and requires greater insulating distance. However, the difference of potential between any two coils is not great and the necessary insulation is small. All these factors lead naturally to the construction used. The high-voltage (secondary) coils are wound on insulating tubes of increasing diameters and decreasing length so that each coil fits inside the next high-voltage tube. The outermost micarta tubes were larger than any previously made and required special mandrels for rolling. The coils are divided into two groups on the two legs of the iron core. Each group consists of seventeen of these nested coils. This arrangement automatically places the coil with the highest voltage furthest from the grounded core. The primary winding, as would be expected, is placed also on a tube immediately surrounding the core.

### STRESS IS UNIFORMLY DISTRIBUTED

Such an ingenious design, a noteworthy achievement by Westinghouse transformer engineers, accomplishes another purpose just as important—the distribution of stress uniformly throughout the winding. To illustrate: If a number of sheets of insulating material were stacked together and a high voltage applied to the top and the bottom connected to ground, the top sheets would assume the greater part of the stress and might indeed fail. The inner portions would not be doing full duty at all. In other words, the stress is not uniformly distributed to all parts throughout the thickness. The most severely stressed material is in danger of failing and that lightly stressed is used inefficiently. Now, if we place metal sheets between the insulating sheets, forming a pile of electrostatic condensers, we find that the stress load is nicely distributed. This condenser principle was discovered by the Westinghouse company and incorporated in transformer terminals known as condenser bushings many years ago. These bushings consist of rolled layers of paper and foil.

The use of the same arrangement has been accomplished in the design of the million-volt transformer and makes possible the construction of a single unit for this voltage with reasonable dimensions. Instead of the metal sheets as in the analogy or foil as in the bushing, the windings themselves form the metal condenser plates. The two ends of each coil (equivalent to a metal cylinder) are not far different in potential, and the tapering difference is exactly matched by similar conditions in the next coil both inside and outside. In order to provide perfect distribution, the area of the condenser elements must be nearly equal. There-

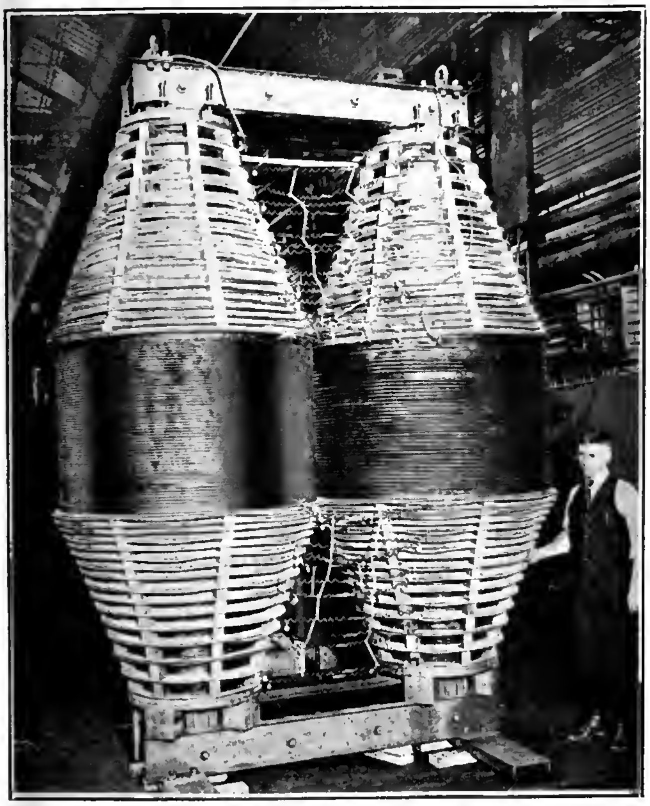
fore, as the diameter increases, the length of cylinders is made correspondingly less.

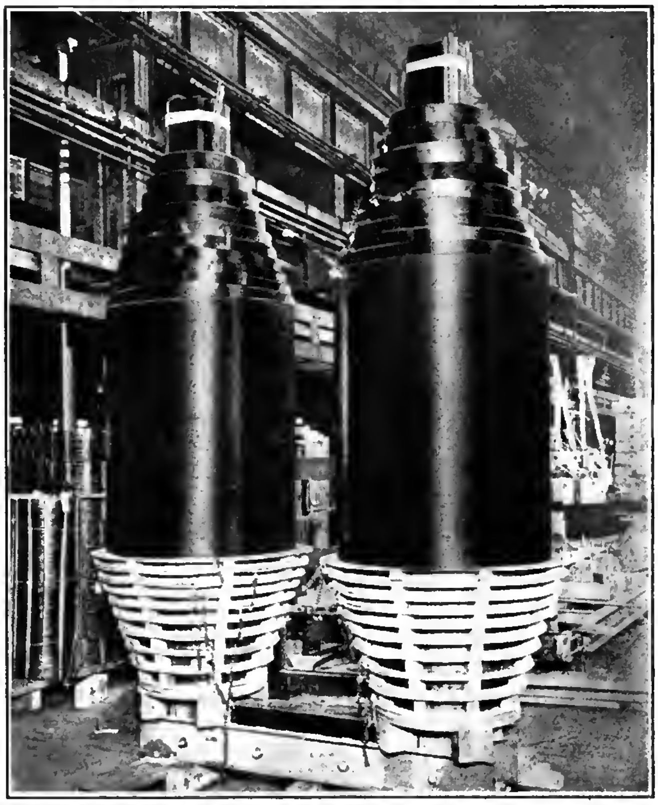
### SAFEGUARDED AGAINST FAILURE

Spacing strips are placed between the cylinders to maintain a concentric position and preserve rigidity. There are two paths by which failure might take place between two parts of a transformer, one by direct puncture of the intervening insulation and the other by creepage along surfaces and over edges. In this transformer the insulating tubes and space filled with oil between tubes protect against puncture. Creepage is prevented by the addition of fullerboard barriers in the form of angle rings which are placed over the ends of the tubes. The use of these offers such a long insulating path that creepage over the edge is prevented.

to the beginning of No. 3, which is on the same leg as No. 1, and so on, alternating back and forth until all the coils on both legs have been connected in series. The end of the thirty-fourth coil is then attached to the wire going to the terminal bushing and thus to the outside.

The transformer tank, which is 13 ft. in diameter by 15 ft. high, is equipped with a special barrier to prevent failure from the transformer coils to the tank. The inside of the tank is lined with many layers of $\frac{1}{4}$-in. fullerboard, separated by oil spaces. This provides an effective insulator outside the transformer. It will be recognized that the outer coils, at a potential of a million volts, must be insulated, first, from the transformer core, which is at ground potential, and, second, from the tank, which is also at ground potential.





CONSTRUCTION FEATURES OF TRANSFORMER COILS

Left—The high-voltage secondary coils on the million-volt unit are wound on insulating tubes of increasing diameters and decreasing length so that each coil fits into the next high-voltage tube.

Right—Failure is prevented by filling the insulating tubes and intervening space with oil, and creepage is prevented by placing angle-ring fullerboard barriers in the ends of the tubes.

Another insulating feature which is important is the protection of coils against surges. Severe testing conditions often result in the sudden release of large energy. This impulse or voltage shock may cause these outer coils to break down and flash over from one turn to the next in an attempt to absorb the energy. A great difference of potential is formed between adjacent turns.

For this reason the outer few coils are wound with heavily insulated cable, and coils farther inside are wound with string separating the wires, to offer greater insulation between turns. The line coil is wound with $\frac{1}{8}$-in. copper with treated cloth insulation $\frac{3}{8}$ in. thick. After the coils are placed on the core legs they are connected in series to add the potential of one to that of the next. Thus the end of No. 1 coil, on one leg, is connected by the beginning of No. 2, which is the first on the other leg. The end of No. 2 winding goes

However difficult it may be to produce a potential of a million volts with a single transformer, it is a greater problem to control and direct this voltage at the terminal. It is one problem to induce this high voltage in the coils and another to bring it outside the tank to be put to some useful purpose. In some existing high-voltage transformers this difficulty is met by placing the transformer in a very large tank of oil, omitting the tank cover and providing a bushing emerging from the surface of the insulating oil. This, of course, leaves the oil open to moisture and dirt and is to be avoided if possible. With a metal tank and cover, the bushing must withstand the million-volt stress between the central conductor and the grounded flange.

Any solid or continuous dielectric interposed in this location would be unsatisfactory, for the unequal distribution of electrostatic stress throughout the cross-section would cause progressive failure. A bushing

utilizing the series-condenser principle of potential gradient equalization was adopted as the only feasible means of bringing the terminal through the cover with a proper factor of safety. This bushing, the largest of its type ever built and the highest voltage bushing in existence, is calculated to be capable of withstanding double transformer voltage, or 2,000,000 volts, for short intervals, imposed upon a radial insulation thickness of less than 18 in. In the factory the largest rolling equipment was too small for this bushing and had to be remodeled. Much greater length and radial dimensions had to be provided, as well as greater strength of head and tail stock to support the extra weight.

The methods used in construction were the same as in any condenser bushing, except that weights of material and dimensions broke all records. The central mandrel of the bushing is made of double extra 6-in. steel pipe. This pipe was carefully turned true and when finished weighed over 1,000 lb. On this pipe were wound the insulation and metal foil. The insulation consists of special treated paper about 0.005 in. thick and 3 in. wide, wound in spiral layers the length of the tube. At intervals as the diameter increases a layer of metal foil wound in a 5-in. spiral strip is added. During the rolling the strips, which are under tension, pass over an electrically heated surface which drives out any traces of moisture and liquefies the coating of the paper so that the layers are cemented together.

The next step was to turn off the ends of each of the hundred layers. The area of condenser cylinders in the bushing must be equal for correct potential distribution. Therefore, as the diameter increases the length is made to decrease. With equal thickness of paper layers the length of cylinders should be a logarithmic function. Ordinarily, a straight conical tapering of the bushing ends is so close to the theoretical curve that the difference is inappreciable. In this million-volt bushing, however, the dimensions are so large that a line drawn through the ends of the steps has a decided curvature.

TABLE I—TRANSFORMER STATISTICS

| | |
|---|---|
| Number high-voltage coils | 34 |
| Total number turns in secondary | 36,000 |
| Total length of wire on secondary, miles | 70 |
| Primary voltage | 5,000 |
| Secondary voltage | 1,000,000 |
| Diameter of tank, ft. | 13 |
| Height of tank, ft. | 15 |
| Rating, kva. | 1,000 |

To provide proper creepage distance over the surface, the hundred layers were stepped off gradually on the upper end, which will be in air, and more abruptly on the lower end, which is to be immersed in oil.

After the rolling and turning had been completed, the bushing was ready for the addition of the metal parts. Banding wire was first wound around the portion of largest diameter, and a cast-iron flange, by which the bushing is supported on the tank cover, was cemented on. A few inches below this flange, at the lower end of the straight section, an iron ring was cemented on to provide mechanical protection when the bushing was laid down. Some idea of the size of the whole unit may be obtained when it is noted that this simple protective ring weighs 150 lb. The lower end of the bushing was fitted with a static shield in the shape of a doughnut which serves to produce a proper distribution of stress around the terminal under oil. The upper end of the bushing was finished with a lifting cap. An insulating tube ¼ in. thick was placed over the top end of the bushing, and the space between this tube and the tapering bushing was filled with insulating gum to prevent entrance of moisture. It is essential that a uniform field be produced between the bushing terminal and the tank cover in order to avoid corona formation and possible flashover of the bushing. The static shield on top is built of wood in shape similar to the lower shield and is covered with sheet metal. It is 10 ft. in diameter and 20 in. thick. Inasmuch as the bushing in this type of transformer is necessarily placed off-center, the usual tank cover would not be symmetrical with the static shield. The cover of the million-volt unit, however, was built with a projecting lip so that a grounded surface concentric with the bushing is obtained. As an added refinement, all manholes and attachments to the tank cover are so fastened that no bolts or other objects project above the flat cover. This prevents corona formation. The finished bushing, exclusive of the upper static shield, weighs nearly 7 tons and contains an amount of material far in excess of any bushing previously designed. Table II shows at a glance the principal weights of this extraordinary condenser terminal.

TABLE II—FINISHED WEIGHTS OF MILLION-VOLT BUSHING

| Total | 13,375 |

## Department of Commerce Acts on Radio Recommendations

ACTING upon the recommendations made by the recent radio conference at Washington, printed in the ELECTRICAL WORLD for March 31, page 765, Secretary of Commerce Hoover has made the following classification of wave lengths for internal broadcasting:

Class A stations—that is, stations equipped to use power not exceeding 500 watts. In this class it is proposed that the radio inspectors, in co-operation with the station owners, shall assign distinctive wave lengths to each station so far as is possible in the area from 222 m. to 300 m. No station will be required to change from 360 m. unless it so desires.

Class B stations—that is, stations equipped to use from 500 watts to 1,000 watts. In this class it is proposed similarly to offer to license these stations on special wave lengths from 300 m. to 345 m. and from 375 m. to 545 m., having regard to the maintenance of some ship work on 450 m. as outlined above, and again no station will be required to change from 360 m. unless it so desires.

Class C stations—comprising all stations now licensed for 360 m. In this class no new licenses will be issued for stations on 360 m. until the plan is entirely realized. Stations which do not wish to move under the general plan may remain at 360 m.

Under the plan amateurs are given the whole area from 150 m. to 220 m., instead of being fixed upon 200 m. with special licenses at 375 m. The special licenses hitherto issued for amateurs at 375 m. will now be issued at 220 m.

# Operating Characteristics of Rural Lines*

## Prevalence of Unusual Conditions Long Familiar to Engineers—Data Now Being Accumulated Indicate the Actual Operating Characteristics—Factors Which Affect Loads

By V. L. HEIN
*Engineering Extension Department, Iowa State College*

FOR some time engineers in a position to observe the performance of rural tranmission lines have known that unusual conditions prevail, although the absence of actual data has hitherto prevented them from proving this to be so. Now, however, material is gradually being collected which shows the actual operating characteristics.

Since 1919 the engineering extension department of the Iowa State College of Agriculture and Mechanic Arts has been collecting information relative to the electric service given by rural transmission lines. During the past year and a half additional data have been gathered showing power factor, maximum demand, amperes, volts and losses on these lines. Rural lines in different parts of Iowa on which meters were installed were arbitrarily chosen for these tests.

The lines from which the data herein were collected are all of similar construction with the exception of line No. 1, which contains about 6 miles of No. 4 B.W.G. iron wire. They were operated at 6,600 volts to 110 volts, 60 cycles. The meters in every case were connected at the point where power was supplied to the line, so that the total kilowatt-hour input was recorded, thus including the energy actually delivered as well as transformer and line losses. The metering equipment consisted of a fifteen-minute-interval recording-demand watt-hour meter, a graphic voltmeter, a graphic ammeter and the necessary metering transformers. As the metering was all done on the 110-volt side of the transformer, a potential transformer for reducing the voltage and a current transformer for reducing the value of the current were used. This necessitated the use of constants in all calculations for power factor. The values indicated on the demand charts must be multiplied by thirty to obtain the true kilowatt reading.

The demand chart (Fig. 1) shows the great variation

*Published as Bulletin 53 by the Iowa State College of Agriculture and Mechanic Arts.

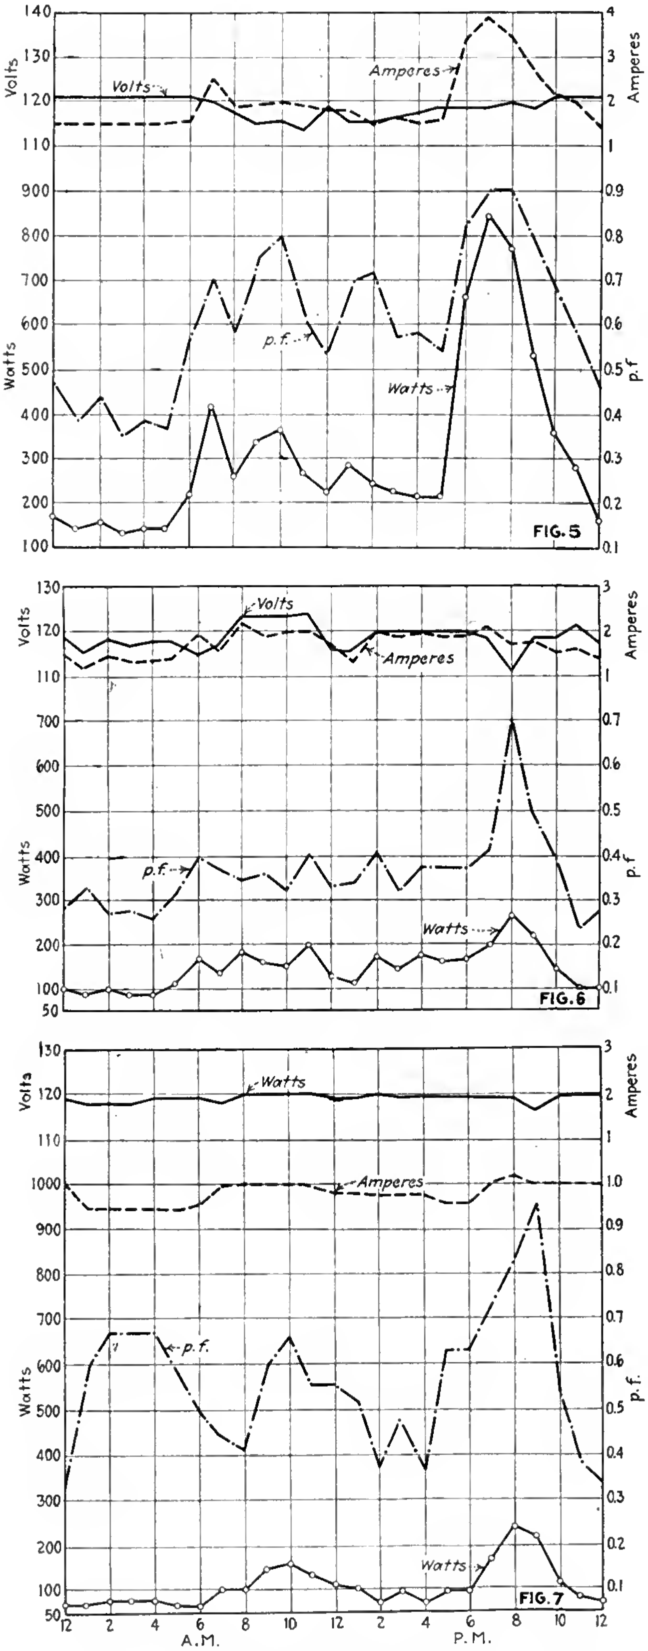

FIGS. 5, 6 AND 7—OPERATING CHARACTERISTICS OF LINES NOS. 1, 2 AND 3 RESPECTIVELY

during the day and night of a line serving thirty-nine rural customers and a small town of four hundred inhabitants at the extreme end of the line. This portion of the chart, which is taken from the record for January, shows a peak considerably above the average but which is one-third less during the summer months.

Particular notice is called to the period between midnight and 5 a.m., which indicates a very nearly constant load. The demand during this period is almost identical every night since it represents the line and core losses of the transformers. The indicated values will be found to check very closely with the total loss of all the transformers connected. Attention is called to the losses as indicated on the following charts over this same period.

The demand chart in Fig. 3 taken from a line having forty customers connected is probably more typical of the demand on existing rural lines. Frequently the evening peak is no greater than peaks occurring during the day. Through the winter months, however, the evening peak is always greater. However, when the weather chart shows that the day was cloudy there would be a greater lighting load of longer duration.

By studying a demand chart of the type shown here a great many things may be detected which will indicate at least some of the characteristics of the load. Weather conditions make an appreciable difference in demand, especially during the evening peak, depending upon whether the day is clear or cloudy. It is also of interest to note that on one day each week the demand is greater than on any other day. Observations so far indicate this day to be Tuesday, probably because of the washing-machine and flatiron load. A study of a series of weekly charts will show also a great deal of similarity for the corresponding days of each week. By knowing the connected load the operating characteristics of the different appliances and motors may be studied from their effect on the demand at the switchboard.

The required current and voltage during an evening peak for line No. 1 are given by the charts in Fig. 2. Readings are for the month of January, so naturally the evening lighting load is high. It should be remembered that this line also serves a small town.

Considerable irregularity of current and voltage is shown for line No. 2 in Fig. 4. The power supply for this line is transmitted a considerable distance at high voltage, which probably accounts for some of the irregularity in voltage. While the average current in this case is low, it does not reach the low limit shown in line No. 3.

A better idea of existing conditions can be obtained from the curves in Figs. 5, 6 and 7, showing operating characteristics for each of the three lines. The charts shown above cover the operation for one day, or portion of a day for each. To obtain data that are characteristic of operating conditions of a line, they should be collected over a twelve-month period in order to show seasonal effects.

Average figures are quoted in the table, which is a brief summary of the data collected during a period of several months.

SUMMARY OF RURAL LINE DATA

| | Line No. 1 | Line No. 2 | Line No. 3 |
|---|---|---|---|
| Miles of line | 22.0 | 30.0 | 27.5 |
| Customers | *39 | 40 | 49 |
| Number of transformers | 32 | 38 | 43 |
| Transformer capacity kva. connected | 165.5 | 128.0 | 87.0 |
| Average transformer capacity kva. per customer | 3.6 | 3.2 | 1.7 |
| Monthly core loss, kw.-hr. | 1,155 | 1,141 | †1,178 |
| Ratio, core loss to energy delivered | 1:54 | ...... | 1:18 |
| Maximum kw. demand (fifteen minutes) | 33.0 | 11.7 | 9.0 |
| Average kw. demand (period of test) | 9.45 | 4.8 | 3.6 |
| Power factor, average | 0.583 | 0.368 | 0.591 |

* County farm included, using 15-hp. motor for grinding and aawing.
† Includes 50 kva. transformer at substation, owned by customers. Master meter on low side of this transformer.

# A Practical Calculating Table

## Resistance Units Take Place of Reactance of Circuits—Sufficiently Accurate for Practical Purposes—Permits Anticipation of Troubles

By E. W. DILLARD

*Assistant Electrical Engineer New England Power Company, Worcester, Mass.*

THERE have been published in several articles various means for estimating mathematically short-circuit current values to be expected from different combinations of electrical apparatus. These calculations can be readily and quickly made for a system with a simple arrangement of equipment, but when applied to an extensive network the calculations are laborious if an exact solution is required. Various approximations have been offered which are, no doubt, reasonably accurate, but the calculations which must be made on an extensive system, involving many networks, require, even with the fastest approximations, prohibitive time, and such a system with its ever-changing conditions, brought about by extensions, developments and variations in load distribution, necessitates a great number of calculations.

The map (Fig. 4) shows the general location of the New England Power System, and the diagram shown in Fig. 2 represents the reactance values of the apparatus in only a part of the system. The entire system must, of course, be considered in short-circuit calculations.

In this diagram the instantaneous reactance of all generators, the reactance of all transformers and the reactance of interconnecting lines are expressed in terms of percentage reactance on a 20,000-kva. base. The diagram has been simplified as much as possible to be concise and yet to contain all the information necessary in estimating a short circuit at any point on the system. It will be appreciated how enormous a task it is to make one calculation, yet operating experience shows that in the course of a single year thousands of calculations are necessary.

In 1917 the New England Power Company constructed a calculating table to expedite this work. This table consists essentially of a representation of each reactance value shown on the diagram (Fig. 2) by a small fixed proportionate resistance unit. The use of variable resistance units was first considered, but as

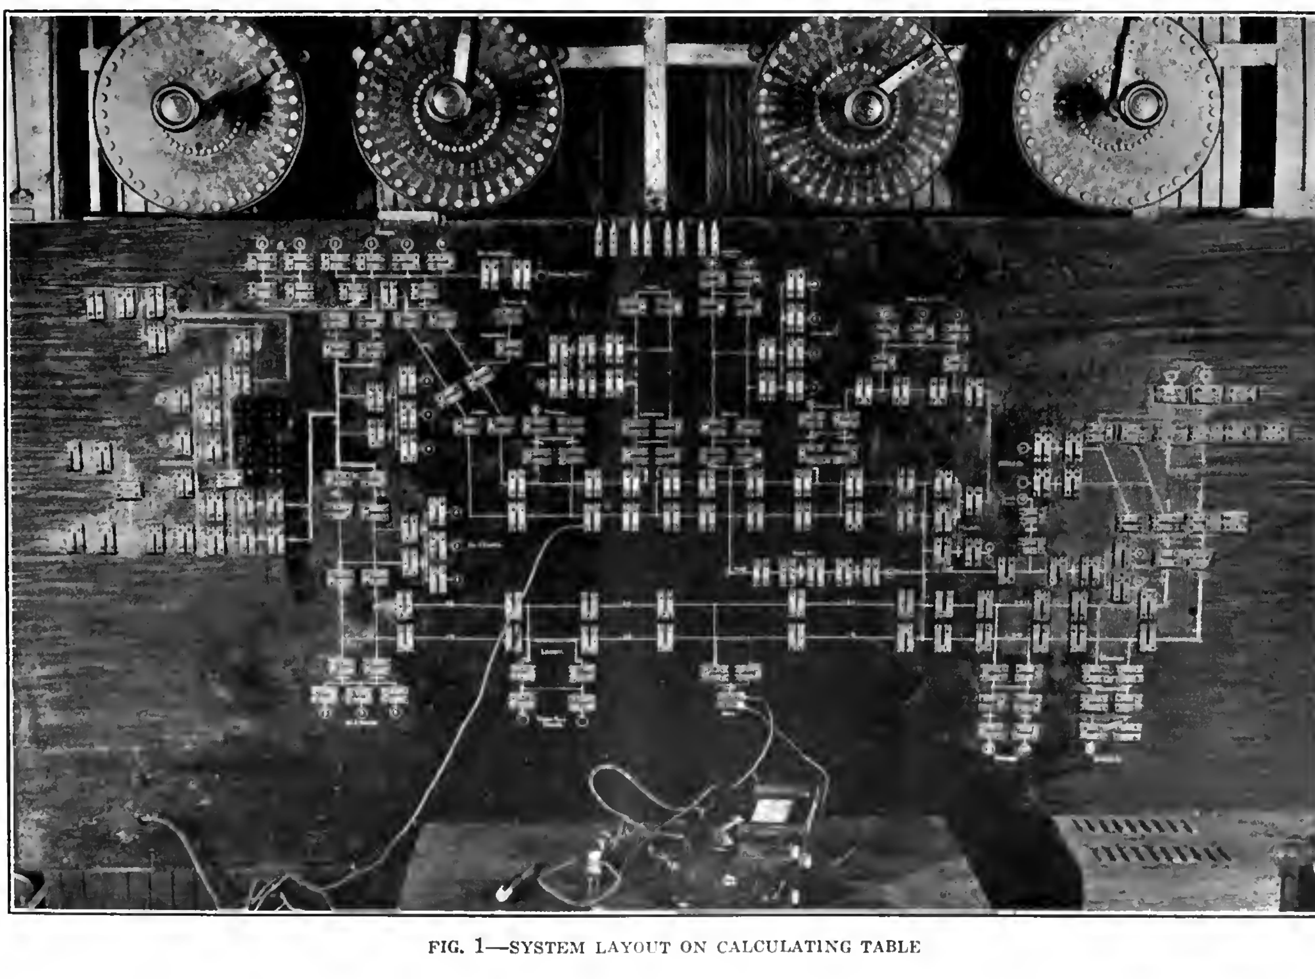

FIG. 1—SYSTEM LAYOUT ON CALCULATING TABLE

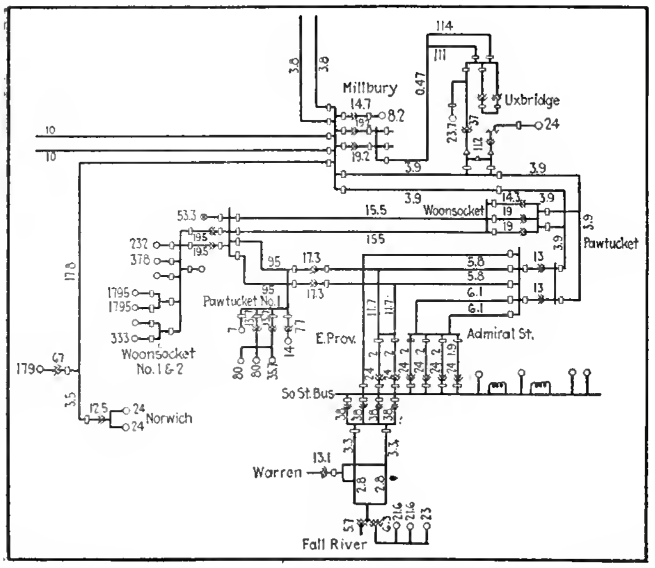

FIG. 2—TO EVERY SECTION OF THE SYSTEM A REACTANCE VALUE HAS HAD TO BE ASSIGNED

This is only one section of the New England Power system, but it serves to indicate the details that must be considered in calculating short-circuit possibilities.

the table was to be designed for calculations on the New England Power Company system only, there seemed to be little justification in abandoning the inexpensive fixed-unit layout for the more expensive, though more flexible, adjustable resistance type.

It was decided to design the table for operation on 110 volts direct current to gain the increased reliability of a moderately high laboratory voltage. The laboratory is equipped with a fifty-cell lead storage battery and a 125-volt direct-current motor-generator set. It was not desirable to use more than about 15 amp. to represent the maximum short circuit to be read on the table, and the resistance units were selected on this basis. The maximum short circuits on the system approximate 750,000 kva., or about 6,600 amp. at 66,000 volts (the primary voltage). For simplicity, it was decided that 1 amp. on the calculating table (110 ohms at 110 volts) should represent 500 amp. at 66,000 volts (57,000 kva.), equivalent to a short circuit of 35.2 per cent on a 20,000-kva. base. Thus, 3.125 ohms becomes the equivalent of 1 per cent reactance on a 20,000-kva. base on the system. Upon this basis resistance tubes were ordered to represent each reactance value shown on the system diagram. These resistance tubes, about $\frac{3}{4}$ in. in diameter and 6 in. long, were mounted compactly under a large office table and wired to test links on the top so arranged as to represent the actual system connections. Fig. 5 shows the arrangement of some units under the table, and Fig. 1 shows the reverse side. For convenience the table was later mounted in the vertical position shown. One side of each resistance unit corresponding to a generator is connected to the positive lead from the direct-current source; the other side is connected to the units representing transformers, these to the units representing lines, etc. A short circuit is established by connecting the negative lead to the point desired. By closing the requisite test links the system condition under consideration can be established at will and varied, if necessary, while the short circuit remains on. By inserting an ammeter in any line or generator upon the system it is possible not only to read the amount of current flowing through this section but to determine also its direction. It is very interesting and also valuable to be able to follow a complete switching operation through in this manner, determining the magnitude of the initial short circuit with its direction through various tie lines, networks, etc., then determining step by step the sequence of operations for a given relay set-up, and determining the duty imposed upon each oil circuit breaker.

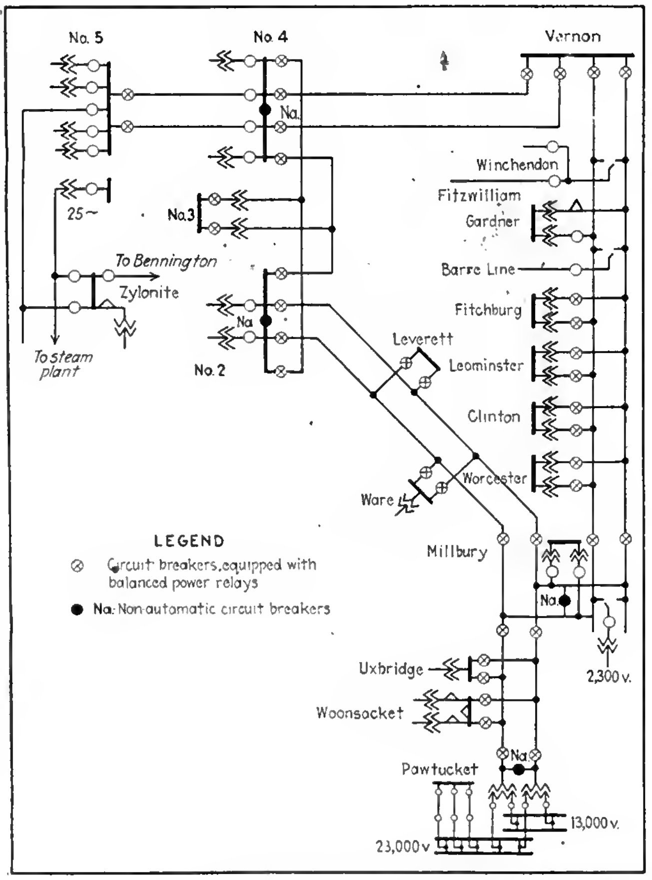

FIG. 3—BALANCED-POWER RELAYS REDUCE CIRCUIT-BREAKER DUTY

### VARIABLE RESISTORS USED IN DEVELOPMENT STUDIES

Immediately above the table are mounted four variable pancake resistance units, which are wired to terminals on the top. Each point of these units is calibrated in ohms and also in per cent reactance. There is also a resistance box from which are brought a number of taps. These five variable units, together with a number of spare resistance tubes, are used to represent proposed developments and extensions to the system on the table when such are required for a particular calculation. A small direct-current motor-generator set is generally used for these tests, and there is mounted on the lower left-hand corner of the board a field rheostat to give voltage control to the generator. Since the original construction there have been numerous changes and additions made to the system, and we have been able to change the table to incorporate these additions with very little work.

In short-circuit calculations reactance values are used instead of impedance values, because a closer approximation is obtained when they are added arithmetically. Fig. 6 illustrates the impedance triangles that might be expected when a simple circuit consisting of a generator, a transformer and a transmission line is short-circuited on the end of the transmission line. The line

$AB$ represents the impedance drop of the generator, the line $BC$ the impedance drop of the transformer, and the line $CD$ the impedance drop of the transmission line, the reactive drops being represented by $X_1$, $X_2$ and $X_3$ respectively. The true short-circuit value would be determined by the line $AD$, but the value of this line cannot be ascertained without a trigonometric calculation. It will be seen that the line $DH$ is virtually the same length as the line $AD$, indicating, therefore, that the error in using $DH$ rather than $AD$ (reactance rather than impedance) is negligible.

### All Important Relay Settings Based on Table Tests

The table is used very extensively in determining the basis for relay settings. No relay setting other than those for unimportant feeder circuits is made unless the values of short-circuit current to be expected under all possible conditions are determined by a series of exhaustive tests. We have found this to be necessary because of the surprisingly wide variation in the extent of short-circuit values during different conditions of load division and plant operation on the system. For instance, during extremely low water conditions it is sometimes desirable to shut down a large part of our hydro-electric capacity, yet this shutting down must be limited to the number of machines required to furnish sufficient energy for the operation of the relays, particularly the switches near the hydro-electric plants. It is, of course, necessary to set the relays high enough to carry the extreme high-load currents of the plants, so we have actually found it necessary to motor machines during low-water periods to give sufficient current to operate these high settings. This fact might have been discovered under rather disastrous conditions had it not been that it was anticipated by exhaustive tests on the short-circuit table.

Each additional generator and each additional transmission line placed in service increases somewhat the short-circuit current through each relay on the system. It is, therefore, necessary, after even minor changes, to calculate the effect of the change upon each individual relay throughout the system.

### Permit Reducing Duty on Breakers

Not only has the short-circuit table been invaluable in relay setting, but it has been equally useful in determining the duty upon oil circuit breakers. Some of our older stations are equipped with earlier types of these breakers whose rupturing capacity is now greatly below the maximum duty that might be imposed upon them. By means of the table we have been able to determine experimentally relay sequences that greatly decrease the amount of energy to be handled by these circuit breakers and have, therefore, postponed, if not prevented, the necessity for replacing them.

For instance, referring to Fig. 3, showing the general scheme of connections of the principal 66,000-volt lines, it was found that the general installation of balanced power relays on these lines would reduce the energy to be handled by the circuit breakers. Thus the double duplicate line extending from No. 2 station to the Millbury substation has been equipped with balanced power relays at No. 2 station, Leverett, Ware and Millbury substations (all of which may be a source of power). If a short circuit occurs just outside the Millbury substation, the total amount of energy flowing into the short circuit will be between 500,000 kva. and 700,000 kva., which is in excess of the rupturing capacity of the Millbury circuit breakers. However, with balanced power relays installed, there is no tendency initially for any circuit breakers to trip other than those at Ware and Millbury. The circuit breaker at Millbury perhaps opens first, but the short circuit, though reduced in value, is not yet interrupted. The circuit breaker at Ware next operates, further reducing the short circuit, and after the Leverett circuit breaker opens the relay at No. 2 station gets its first tendency to operate. It, of course, operates, tripping the last circuit breaker on the bad line, which ruptures the short circuit, but the short circuit is now much lower than it was originally on account of the introduction of the reactance of the line between No. 2 station and Millbury by the selective operation of breakers up

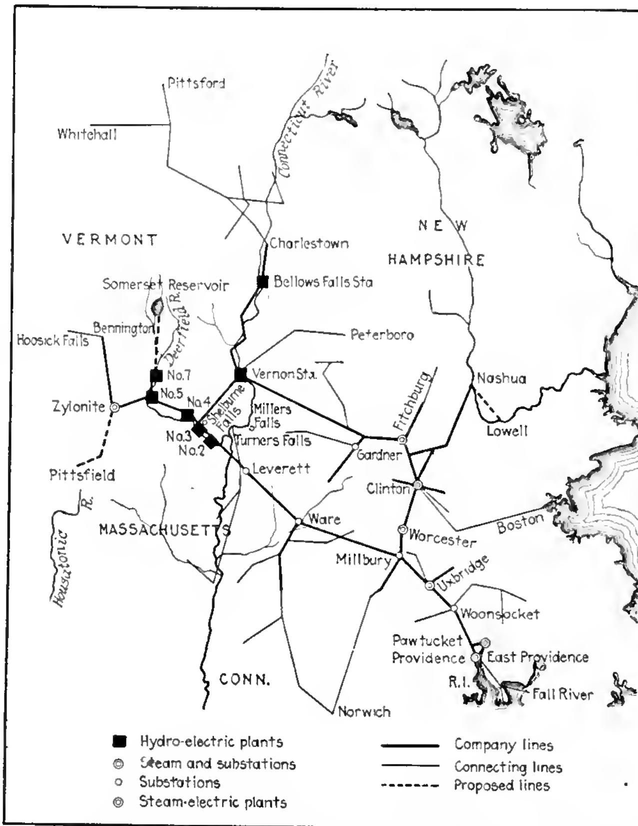

FIG. 4—SYSTEM OF NEW ENGLAND POWER COMPANY, ON WHICH CALCULATING BOARD IS USED WITH GREAT SATISFACTION

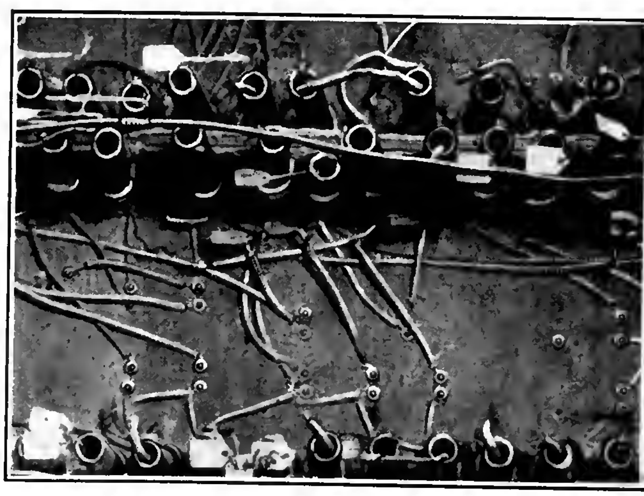

FIG. 5—METHOD OF MOUNTING RESISTORS WHICH TAKES PLACE OF EQUIVALENT REACTANCE OF CIRCUITS

and down the line. In practice it works out that each of these four circuit breakers will open, roughly, about a fourth of the short circuit. (This value, of course, varies somewhat with the location of the short circuit.)

Studies similar to those made for relay settings are made to determine the effect upon circuit breakers of every system extension of any consequence. These studies have at least warned us of the danger points and have been of great value in determining the proper capacity circuit breaker to be used in new installations.

In short-circuit calculations we have not found it practicable to make much use of time-decrement curves. There is connected to the New England Power Company's system somewhat over 500,000 kva. in generator capacity, all of which contributes more or less to any short circuit. Since the maximum short circuit on the high-tension system is within 750,000 kva., this maximum represents a short circuit of a 500,000-kva. system through 66 per cent reactance. There is only a negligible falling off of current after any time value applicable to circuit-breaker operation during a short circuit of such high relative reactance. This statement, of course, does not hold true in regard to the generators in close proximity electrically to the short circuit, for the short circuit of these generators is one of relatively lower reactance. On the other hand, the opposite thing holds true of generators more remote electrically from the short circuit, and it is probably safe to assume that these two factors offset each other.

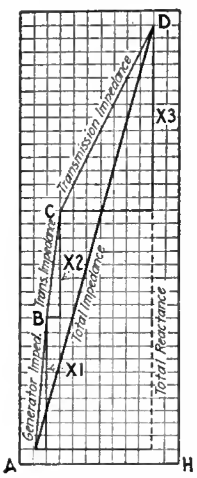

FIG. 6

Small difference between total reactance and total impedance of interconnected system.

Oscillograph tests have been made from time to time, and other data collected, to indicate accurately by an independent means the amount of energy flowing into various short circuits. These data have agreed within reason with those obtained by the calculating table.

# Hydro-Electric Progress in Canada During 1922

FROM data compiled by the Dominion Water Power Branch, Department of the Interior, it is shown that during 1922 the total water-power installation in Canada grew to approximately 3,000,000 hp., of which 240,284 hp. was installed during the year. This figure does not include 190,000 hp. installed during 1922 but only brought into operation after that year had closed. Projects are now under way which will have an ultimate capacity of more than 1,000,000 horsepower.

The details of progress during 1922 are set forth in the accompanying tables. Special attention may be called to the storage development on Stave Lake and Falls Creek, British Columbia, to increase the output of existing plants; the development of the Manitoba Power Company at Great Falls, on the Winnipeg River, where the first unit of 168,000 hp. was put into service in December; the rapid increase of the installation by the Ontario Hydro-Electric Commission at Queenston; the great activity in Quebec, which includes immense developments under way on the Saguenay River and at Gres Falls on the St. Maurice River, and also the steadily maintained progress in the Maritime Provinces.

Note.—In addition to the installations shown in the above table provision has been made in a number of existing plants for extensive additions as the loads increase. In addition also to the projected plants listed there are numerous other projects under study.

# Nomographic Chart for Designing Illumination*

## Applicable to Direct or Indirect Illumination, Using Photometric Curve of Fixture or Intensity Readings in One Plane

BY EMIL KUN
Springfield Gardens, Long Island, N. Y.

A VERY practical method for designing illumination was described in a previous issue of the ELECTRICAL WORLD (October 9, 1920, page 721) by M. M. Samuels and C. O. von Dannenberg. This method is equally and easily applicable to direct and indirect illumination, either by using the photometric curve of the lighting fixture or by obtaining foot-candle intensity readings in one plane with the aid of the foot-candle meter. It involves, however, mathematical calculations, or a graphical solution, which is to be repeated for each point to be determined, in addition to the usual tables containing values of $\cos^3\phi$ or $\cos^3\phi/H^2$ when the photometric curve is used as a starting point.

To simplify the operation and eliminate the use of all tables of coefficients, without sacrificing any of the accuracy of the method, the Nomographic chart shown herewith may be used to determine illumination without the use of any other tables of coefficients or angles. In order to explain the use of the chart the method developed by Messrs. Samuels and von Dannenberg may at first be briefly summarized. When the polar photometric curve of the fixture is used as the basis of calculation, the horizontal intensities are determined in a selected plane, which will be called "primary plane," by the well known formula:

$$I_1 = \frac{\cos^3\phi}{H_1^2}\ \text{cp.}$$

where $\phi$ = angle between the selected light beam and the vertical line,

$H_1$ = height of the focal point of fixture above the primary plane in feet,

cp. = candlepower of the lighting unit at angle from vertical,

$I_1$ = resulting intensity, in foot-candles.

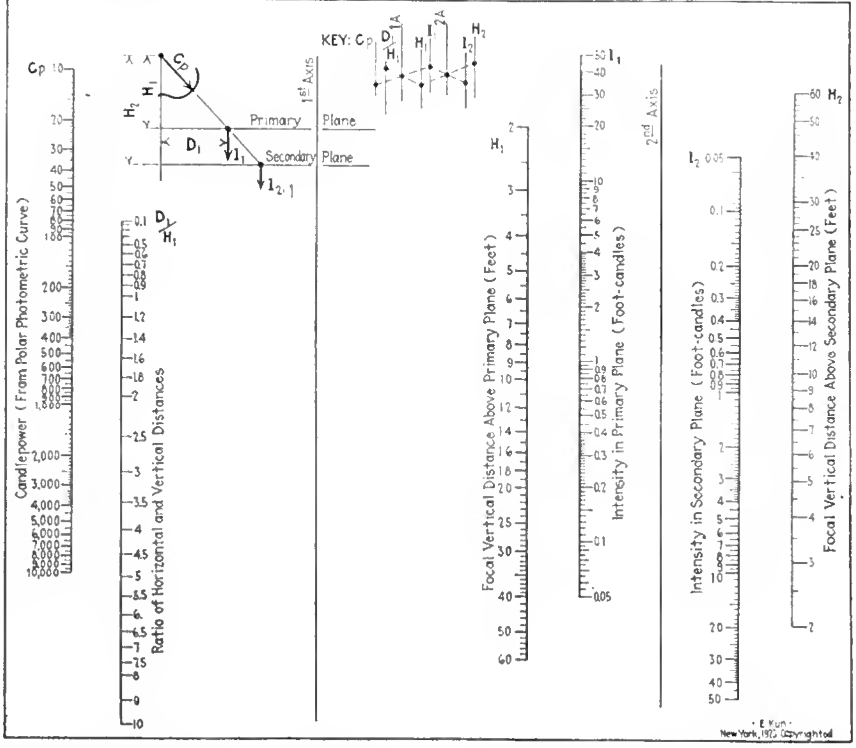
After obtaining a full-intensity curve for this primary plane, intensity curves may be developed from this curve for any other horizontal plane without referring again to the photometric curve. Let $H_2$ be the height of the focal point of fixture above another selected plane, which will be called "secondary plane," and which may be either above or below the primary plane. Then the horizontal intensity of illumination at the intersecting point of this secondary plane and the same light beam will be

$$I_2 = \frac{\cos^3\phi}{H_2^2}\ \text{cp.}$$

But since we are working with the same light beam, this new intensity can be directly determined from the intensity in the primary plane by dividing the above two formulas into each other, and we get:

$$I_2 = \frac{H_1^2}{H_2^2}\ I_1.$$

When using indirect or semi-indirect fixtures the best method is, as Messrs. Samuels and von Dannenberg pointed out, to obtain the intensity curve in one plane by making measurements with the foot-candle meter in a selected "primary plane," and with the fixture stem and ceiling conditions arranged in as close conformity to the conditions under which the fixtures will be used as possible and from this curve to develop intensity curves for other planes. From this intensity curve can also be determined the "fictitious polar curve," which is the polar photometric curve of a hypothetical direct lighting unit producing an illumination equivalent to the illumination on horizontal planes produced by the indirect or semi-indirect fixture under consideration.



CAN SOLVE ILLUMINATION PROBLEMS STARTING WITH CANDLE-POWER OR FOOT-CANDLES

The nomographic chart here reproduced is a combination of the nomographic representations of the two above given formulas, namely:

$$(1)\ I_1 = \frac{\cos^3\phi}{H_1^2}\ \text{cp. and } (2)\ I_2 = \frac{H_1^2}{H_2^2}\ I_1.$$

The first formula is represented by the scales cp., $D_1/H_1$, $H_1$ and $I_1$, and the second by the scales $H_1$, $I_1$, $I_2$ and $H_2$. As noticed, the scales of $H_1$ and $I_1$ are common for both nomographs, and so the problem can be worked out in any direction, starting either with the candlepower of the lighting unit or the measured foot-candle intensity in the primary plane.

To obtain the intensities according to the first formula, points can be selected on the primary plane at distances $D_1$ from the vertical. The values $D_1/H_1$ for each of these points may be easily figured without even a slide rule, especially if the height $H_1$ for this primary plane is selected, for instance 5, 10 or 20 ft., according to the range of the unit. The index line drawn between

# Table I—Data on Output and Peak Load of Largest Generating and Distributing Systems in the United States and Canada

(This table includes all lighting, power and electric railway companies in the United States and Canada having yearly outputs in excess of 100,000,000 kw.-hr.)

| Company | Rank in 1922 | 1922 Peak Load (Kw.) | 1922 Date of Peak Load | 1922 Output for Year (Kw.-Hr.) | 1921 Peak Load (Kw.) | 1921 Date of Peak Load | 1921 Output for Year (Kw.-Hr.) | 1920 Peak Load (Kw.) | 1920 Date of Peak Load | 1920 Output for Year (Kw.-Hr.) | 1919 Peak Load (Kw.) | 1919 Date of Peak Load | 1919 Output for Year (Kw.-Hr.) |

* Purchased by Hydro-Electric Power Commission of Ontario on Nov. 1, 1922. Blank indicates that no report covering year was received.

the values of $D_1$ $H_1$ corresponding to the location of the point under consideration and the point on the $H_1$ scale representing the height of the focal point above this plane will cut the first axis in a point which projected by another index line drawn from the cp. (candlepower) scale will cut the $I_1$ scale at the resulting horizontal intensity.

In order to determine the intensities in the secondary plane, an index line should be drawn between the proper points on the $H_1$ and $H_2$ scales. This index line will cut the second axis line in a point which will be constant for all calculations between the two selected planes. By projecting the values on the $I_1$ scale through this point to the $I_2$ scale, the resulting intensities in the secondary plane may be directly read off. It should, however, be remembered that these corresponding intensities are not above each other on the two planes, but on the same light beam, and for this reason the location of the corresponding points should be determined by drawing up on a piece of paper two horizontal lines representing the two planes, in a suitable scale, and projecting the selected points on the primary plane to the secondary plane from the focal point of the unit.

As may be seen from the above explanation, the chart may be used in either direction. Problems of determining the proper height of the fixture or determining the necessary candlepower values for the unit can be solved almost instantly, without the use of any tables, and with an accuracy which is very close to that of methods involving calculations.

# Eight Systems with Output of 1,000,000,000 Kw. in 1922

### "Electrical World" Survey Indicates, Besides, that Last Year Ninety-two Companies of the United States and Canada Reported Individual Outputs Exceeding 100,000,000 Kw.-Hr.

IN LINE with its policy of keeping in intimate touch with the operations of the central generating plants of the country, the ELECTRICAL WORLD has just completed a survey of the electric generating and distributing companies of the United States and Canada having a total output in excess of a hundred million kilowatt-hours during 1922. A similar survey undertaken during past years indicated that in 1919 there were six companies distributing in excess of a billion kilowatt-hours, in 1920 nine such companies, and in 1921 only five. The present investigation indicates that eight electric light and power companies distributed over a billion kilowatt-hours last year. Of these eight systems, six were operating in the United States and two in Canada. There were also six other systems whose output was very close to the billion mark.

Table I is believed to be a complete list of the electric light and power companies and electric railway companies of the United States and Canada with an output in excess of 100,000,000 kw.-hr. during 1922, giving also their total output and the amount and date of their peak load. Table II lists these companies by sections of the country and gives the proportion of the output which was generated, the proportion purchased and also the distribution of the energy.

Ninety-two electric light and power systems and ten electric railway systems reported an output in excess

## Table II—1922 Detailed Output and Distribution Data for North American Systems

| Section and System | Generated and Purchased Output, in Kilowatt-Hours | | | Distribution of Energy, in Kilowatt-Hours | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Total Output | Generated | Purchased | Light | Power | Light and Power | Electric Railways | Other Public Utilities | Inter-Company Business and Line Losses, Etc. |

(a) Includes also certain affiliated companies known as the "West Penn System." (b) Reported as "Commercial and residential customers." (c) Reported as "industrial customers." (d) Includes power for electric appliances, which is estimated to be 42,509,000 kw.-hr. (e) Includes 8,327,726 kw.-hr. for municipal street lighting. (f) Includes 10,635,307 kw.-hr. for municipal street lighting. (g) Does not include 75,563,710 kw.-hr. generated at Blue Island station and prorated to the Commonwealth Edison Company. (h) Includes 174,475 kw.-hr. for lighting supplied by company in Commonwealth Edison territory. (i) Includes 16,127 kw.-hr. for power supplied by company in Commonwealth Edison territory. (j) Includes intercompany sales. (k) Includes combined light and power. (l) Includes energy sold to municipalities. (m) Includes 1,925,377 kw.-hr. for municipal lighting and 212,425 kw.-hr. for heating and cooking. (n) Includes 9,078,044 kw.-hr. distribution line losses, 13,696,832 transmission line losses, and 1,288,323 kw.-hr. used by company. (o) Included under "lighting." (p) 6,928,030 kw.-hr. generated at plant of Birmingham Light & Power Co., under joint operation. (q) Included under "Other Public Utilities." (r) Included under "Light and Power." (s) Includes Pawtucket and Woonsocket divisions. (t) Output metered at generating station.

of 100,000,000 kw.-hr. in 1922. The total output of these electric light and power companies was in excess of 41,000,000,000 kw.-hr. Deducting the output of the Canadian systems gives 35,577,290,423 kw.-hr. as the total output of the electric light and power companies in the United States having an annual output in excess of 100,000,000 kw.-hr. This would indicate that about 70 per cent of the total output of the central generating and distributing companies of this country is distributed by ninety-two systems.

The Niagara Falls Power Company leads the country, reporting a total output of 2,252,249,000 kw.-hr., all of which was generated at its own plants. The Commonwealth Edison Company of Chicago, which took the lead in 1921, is a close second, reporting as its output 2,225,442,875 kw.-hr., of which 99.25 per cent was generated in its own plants. The New York Edison Company and the United Electric Light & Power Company, combined, were third, displacing the Pacific Gas & Electric Company. The Hydro-Electric Power Commission of Ontario, however, reported the largest output of all systems in the world, with 2,392,092,267 kw.-hr.

The largest peak load was reported by the Commonwealth Edison Company of Chicago, with 600,000 kw. The New York Edison Company and the United Electric Light & Power Company combined had the second largest peak load, with 497,577 kw.

The larger electric generating and distributing companies are fairly well scattered over the country, although, of course, most numerous in the industrial sections. It is rather surprising that during the past two years only one system in the Mountain and Pacific States has entered the 100,000,000-kw.-hr. class as against thirteen Eastern companies. Also the intensely industrial New England section reports no company with an output in excess of 500,000,000 kw.-hr.

# Unusually High Operations During January

### Output for the First Month of the Year Totaled 5,245,000,000 Kw.-Hr., an Increase of 28.5 per Cent for the Twelve-Month Period

FOUR new records were hung up by the electric light and power industry during January. Reports for the month received by the ELECTRICAL WORLD from electric generating and distributing companies representing 78 per cent of the installed generator rating of the country indicate that the average daily output was 169,290,000 kw.-hr. This exceeded the previous record, made during December, by 1,232,000 kw.-hr. In addition, the total output for the month of January was 5,245,000,000 kw.-hr., which exceeded the former high monthly figure, set during December,

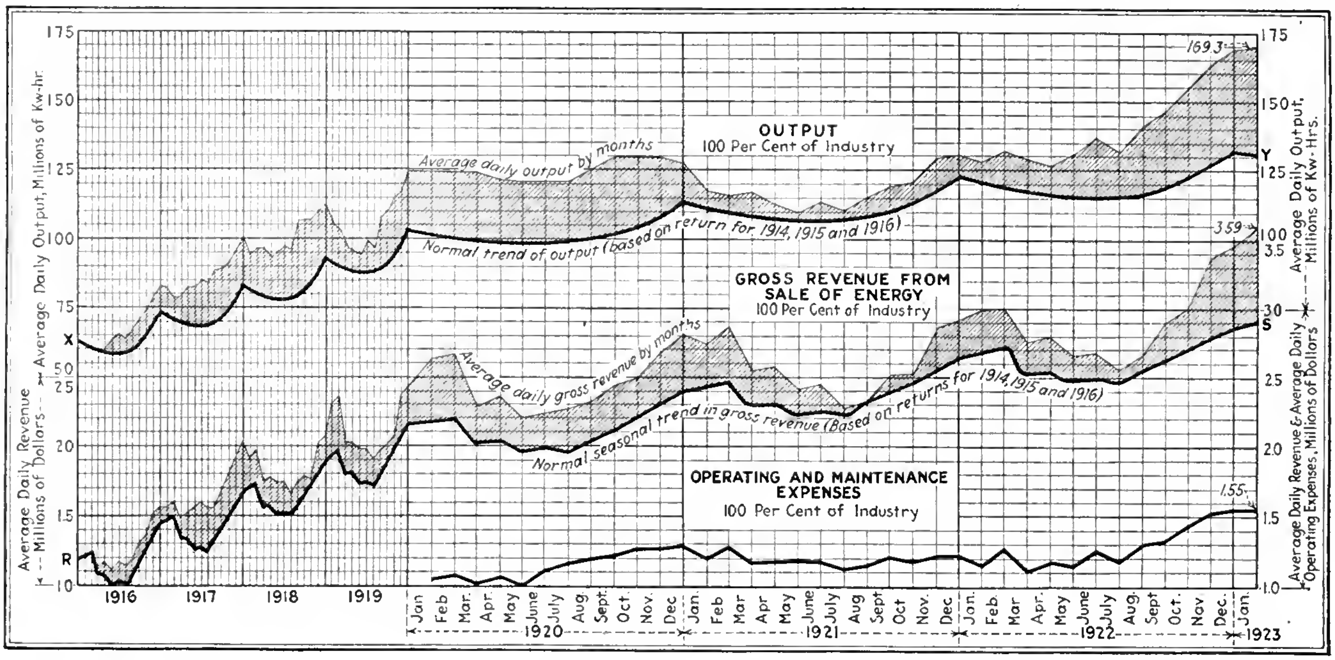
| | | 1923 | 1922 | | 1923 | 1922 | 1923 | 1922 | 1923 | 1922 |
| Jan... | 59 | 28,486 | 23,050 | 23.6 | 47.3 | 45.3 | 23.8 | 23.4 | 45.3 | 43.1 |



by 45,000,000 kw.-hr. and the output reported for January, 1922, by 28.5 per cent. The second set of record figures reported by the central stations for the month of January is to be found in the revenue received from the sale of energy. The average daily revenue from the sale of energy during January was $3,590,000, which exceeded the previous record, made during December, by $123,000. In addition, the total gross revenue for the month of January totaled $111,300,000, which exceeded the previous record, made during December, by $3,800,000.

Expressing the financial phase of the returns in terms of the operating ratio, or ratio of operating expenses to the gross revenue from the sale of energy, shows that the industry is not in quite so good a position financially as it was this time last year. The operating ratio reported for January by companies having steam plants only, taken in the aggregate, was 47.3 per cent against 45.3 per cent for January of last year. It is encouraging to notice that the operating ratio has decreased from 56.6 per cent in August, or by about 9.3 per cent. Such a decrease in the operating ratio between winter and summer months is to be expected, however, on account of the relatively higher percentage of low-revenue industrial energy sold during the summer months. If the normal trend of past years is followed, the operating ratio should commence to increase with February on account of the decreasing high-revenue lighting load, but if the price of coal decreases during the spring months, it may be that the operating ratio will decrease to a lower point than that reached during January, nothwithstanding the decreased lighting requirements.

## Study of Street-Lighting Practice

THE study of street-lighting service undertaken by the Bureau of Standards several years ago but suspended in war time has been actively resumed. This study will cover street lighting in all its phases—gas, electric and other special types. The problems of design of street-lighting systems from the illuminating standpoint, the distribution of gas and electricity for street lighting, methods of operation and maintenance and the technical and engineering features of contracts for street-lighting service will be included. The results of this and other studies on the subject will be presented, if possible, in the form of a publication.

# Letters from Our Readers

A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute

## Rating of Electrical Apparatus

*To the Editors of the* ELECTRICAL WORLD:

In answer to your request for a commentary on the new British standard specifications, referred to in your issue of March 24, I would say that, in my opinion, they are a step forward in giving proper recognition to the requirements of the user. These requirements I shall attempt to cover in their essentials in the following notes.

The fundamental reason that eventually will make the double rating of electrical apparatus the accepted engineering and commercial standard is one which in the ultimate analysis directly affects only the user.*

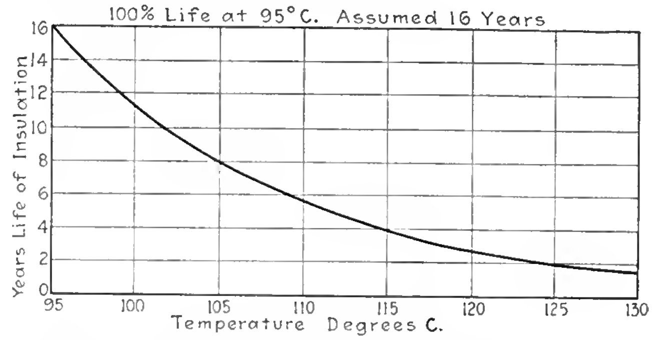
The maximum power capacity of an electrical machine is not a definite quantity representable by a single value, such as is the cubic-feet flow of water per second in a water-power plant. As a matter of fact, the power of most electrical apparatus may vary widely. It is therefore obvious that to make an intelligent application of the apparatus the user must know the limits of power which he may expect to obtain from a machine when unusual or unforeseen conditions are encountered. To illustrate with a few simple cases, the power engineer who is equipping a machine for sawing 2-in. planks will inform his client that if in an emergency he must saw a 3-in. plank the motor will have sufficient power to do his work safely. A distribution engineer planning a customer's service connection will provide not only transformers and cable connections capable of carrying continuously the estimated maximum load of the building, but also a liberal margin to meet unexpected larger demands, or even to carry the customer's load with a portion of the transformers and cable connections temporarily disconnected on account of failures of apparatus or other emergencies affecting the distributing system. The designer of a substation will similarly have to reckon that if he loses one of the transforming sets those remaining must have the capacity needed to carry the maximum load even if they should, for the time being, operate in excess of their normal load. These conditions are not the exception; they are the general rule for the great majority of power applications, since there are relatively very few applications where the maximum possible demand of power is strictly limited to a definite amount, as would be the case with a water-pumping set where the load was limited by both the speed and the head of water. If there should be no elasticity whatever beyond the rated capacity of the electrical apparatus in a substation, let us say, to meet emergencies or limited demands of short duration, it would in regular operation be equivalent to actually reducing the substation's capacity. It is evident that the operators would refrain from approaching the loading of the apparatus to the full rated capacity, as they would then have no safety margin left at all, and to provide for such margin on which they might be compelled to fall back at any time, they would actually reduce the maximum load which they would allow the station to carry to a certain amount below the rated capacity, thus providing at a sacrifice of operating capacity the necessary flexibility. There is, therefore, no question that the user must recognize those conditions of service which occasionally demand an increase in power over that nominally required. On this vital point rests the difficulty of the single rating.

If we choose to give a piece of apparatus only one rating, we are confronted with two alternatives:

(1) The rating may be conservative, but we then fail to inform the user of the extra capacity available for the occasional heavier load demands that are mentioned above.

(2) The rating we choose may approach the maximum capacity of which the apparatus is capable, but then the user, to provide the margin for the occasional heavier loads, must "derate" the apparatus; that is, he must select equipment of larger size in order to secure the margin of capacity required for his occasional heavier load demands.

Many will perhaps say that all apparatus will carry considerable overloads without breaking down, and that engineers of course figure in the back of their heads on such margins of capacity in motors, cables, transformers, etc. On the other hand, it seems that such haphazard procedure in figuring a margin of capacity to meet unavoidable temporary overloads is apt to be uneconomical and to lead to unsatisfactory or wasteful results.



CHARACTERISTIC LIFE OF ELECTRICAL INSULATION AS AFFECTED BY OPERATING TEMPERATURE

This curve indicates graphically that, other things being equal, a machine operating at 105 deg. C. will have a life only 50 per cent of that of a similar machine operating at 95 deg. C. From the curve we can calculate that if we operate a machine 90 per cent of the time at 95 deg. C. and the remaining 10 per cent of the time at 115 deg. C., the life of the machine will be 77 per cent of the virtual life at 95 deg. C. for 100 per cent of the time, and similarly that this 77 per cent of the virtual life would be more than 50 per cent longer than the life of machines operating 105 deg. C. for 100 per cent of the time.

The double rating undoubtedly gives the user a more satisfactory means of selecting his electrical apparatus to meet most economically both the normal and abnormal conditions of service.

The double rating was used the world over up to a few years ago. In this country it was largely abandoned during the period of the war, perhaps without any bestowal of the careful consideration which the importance of the change would have justified. Abroad somewhat similar steps were taken, but at least one large country—Great Britain—has recently arrived at the conclusion that the single rating is commercially impracticable, the users having definitely refused to adopt it.

*The present discussion specifically excludes steam and hydro turbo-alternators of large sizes, for which single rating was generally adopted long before the A. I. E. E. or the International Electrotechnical Commission adopted the single rating for any machines. The special reasons which led to that practice for turbo-alternators are still valid and the practice should be continued.

The original proponents of the single rating had in mind establishing a simple method of rating which would avoid the complications of measurements of temperature rise for two loads, i.e., normal load continuous and two-hour overload. They compromised by selecting the single rating at a point slightly lower than the overload limit of the double rating.

In selecting this compromise value they in effect boosted the old normal rating 15 per cent to 20 per cent and entirely dropped the overload rating. This naturally raised a strong protest from many consulting engineers, users and manufacturers who were dissatisfied with the lack of conservatism shown in the innovation.

The principal objection to the "normal and overload rating" arose from the fact that the percentage of overload and the period of its duration had never been standardized. In practice 25 per cent and sometimes 50 per cent overload was specified for periods of one, two or three hours, without stating the time intervals between overloads, so that it was very difficult to make comparisons between machines of different makes or from different countries. Hence it followed that the single rating as an international standard based on a uniform rise of temperature, which avoided all these complications, suddenly met with the favor of many, except for the criticism that the rise allowed for the single rating was too great and therefore not sufficiently conservative.

Returning now to the time when the double rating was universally practiced and having in mind the objections which made it unpopular, it is desirable to review afresh the whole problem and attempt to arrive at a new solution that may combine the advantages of both systems of rating.

This desirable solution can be reached readily if in our double rating we will omit the period in which the given overload will produce a specific temperature rise, but will prescribe that the overload rating shall refer to the ultimate temperature to be reached by the machine, regardless of whether it shall require one hour, or two or more, with the overload kept constant.

By this expedient the determination of temperature rise for overloads becomes exactly the same as for the normal load or, as a matter of fact, for the single-rating machine. To simplify the matter, the standard rules might specify for acceptance tests that only the overload tests should be required. This plan would overcome the original objections of the double rating. The plan is practicable and feasible for all classes of machines like motors, transformers, etc., and it is obviously proper to say that a motor having an overload rating of 25 hp. with an ultimate temperature rise of 55 deg. C. will not have to be of radically different design from a 20-hp., 40-deg. C. motor with two-hour overload at 25 hp. with 55 deg. C. There will be practically no differences for any rotating machine of any size where the time overload is two hours or more, for experience shows that within that period rotating machines in general reach within two or three degrees of the ultimate temperature, even in the case of the largest size units. For oil-cooled apparatus the time required to reach ultimate temperatures is more than two hours, but this fact will not handicap the plan suggested.

The suggestion of substituting the ultimate temperature rise for the overload rating is also justifiable from the advanced knowledge we have now of the relation between temperature and life of fibrous insulation. We know that treated fibrous insulation can withstand safely for short periods of time temperatures as high as 150 deg. and 160 deg. C., and that it can sustain continuously temperatures of 120 deg. C. for over two years without being destroyed. The characteristic life of a machine as affected by operating temperature of its insulation is represented by the curve reproduced. (See *A. I. E. E. Journal*, June, 1922, at page 446.)

This new knowledge of the properties of insulation gives us a new guide for the interpretation of the double rating of electrical machinery. It gives us the basis to rate the machines for normal load with a rise of temperature that will produce the longest and most economical life and for overloads with a rise that will not endanger the safe operation of the machine when carrying the occasional heavier load demands of the service as the demands arise. The meanings of the two ratings of normal load and overload are logically correlated to the practical requirements of the great majority of services of power application. With this clear understanding that in practice there exists a marked distinction between average or normal load of a service and the occasional maximum or overload requirements of power, the designer will direct his efforts to obtain the highest efficiency and highest power factor possible for the conditions of normal load and will tolerate relatively reduced efficiency for overloads, for which reduction in efficiency he will be allowed, without increased cost, to put into the machine more capacity for overloads than he would be able to obtain from the same amount of materials if used to produce a single-rating machine having the highest efficiency at that rating.

I think that the suggested plan will eliminate the enormous misunderstanding that has arisen from the hopeless attempt to consolidate in one compromise rating two things which are economically inconsistent with each other; that is, the capacity for normal load and the capacity for maximum load, each of which has a definite practical significance in application and service and which cannot both be economically and commercially covered by a single value. This is what has been attempted by the single rating. Without heat or prejudice let us now attempt to see whether the suggestion herein offered may not bring us all back to full mutual understanding.

PHILIP TORCHIO,
Chief Electrical Engineer.
New York Edison Company,
New York, N. Y.

## A Misleading Patent Note

*To the Editors of the* ELECTRICAL WORLD:

I read in the record of electrical patents in the ELECTRICAL WORLD for Feb. 24 the following entry: "1,444,620. Air-Motor-Driven Generator; E. Lunn, Chicago, Ill. App. filed Sept. 12, 1921. Wind-driven generator for charging airplane batteries."

I appreciate the fact that only the briefest kind of information relative to a patent can be given in such a short note, but in this case the entry is misleading in that the patent does not refer in any way to charging airplane batteries. It covers a combination of an air motor, an electrical generator and gearing between the motor and generator, the idea being to make a more efficient combination of these three elements than has heretofore been assembled. No reference is made as to how the current generated should be used.

Pullman, Ill. ERNEST LUNN.

# Central Station and Industrial Practice

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Where the Money Goes in the Building of Transmission Lines

THE diagram shown on this page illustrates how each dollar was expended in securing and preparing transmission rights-of-way and in erecting the towers and stringing the conductors for an 80-mile section of double-circuit, 100,000-volt steel-tower line requiring six No. 2/0 conductors and one ⅜-in. steel ground wire. It is based on very careful records kept by an electric service company in the Southeast. The cost of the materials used is not included. While the cost per mile of line erected is not available for publication, it can be said that it is very low and agrees well with the average cost obtained on this system in erecting about 200 miles of similar circuits this year.

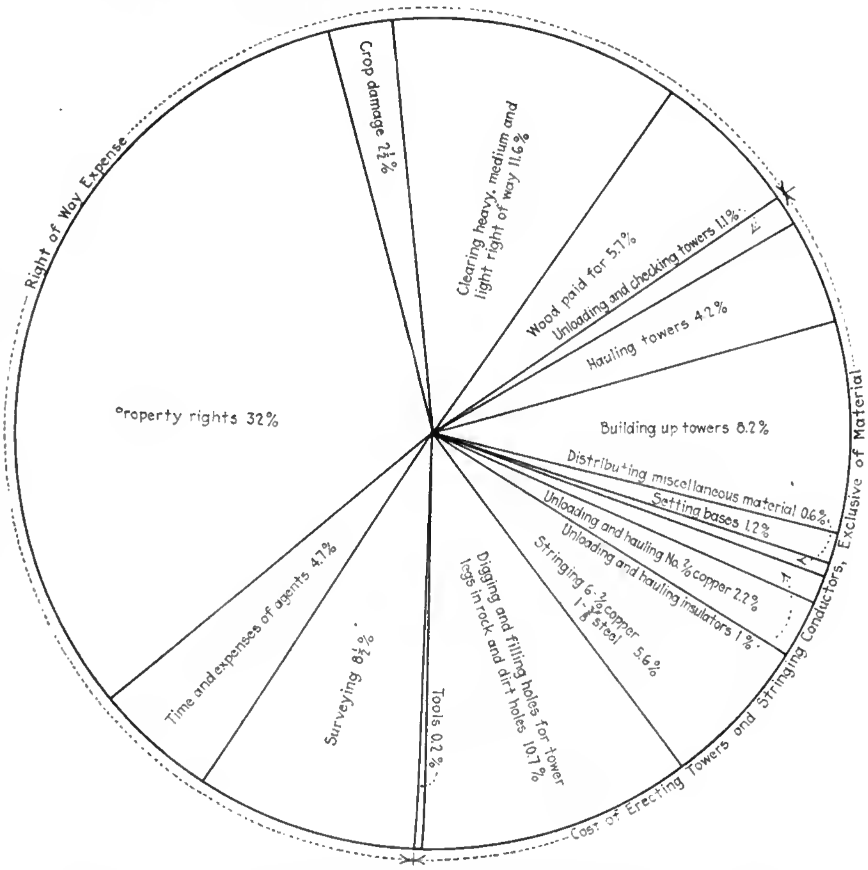
The figures for the right-of-way are a little unusual in that there was considerable difficulty in locating this particular line and therefore the item of surveying is almost double what it ordinarily is. The line also passes through rather heavily wooded country, and the item of clearing is considerably larger than usual. The expenses of the agents on this line were also high because of this heavy clearing.

The data on which this diagram is based were collected each day during the construction of the line and took into careful consideration the cost of labor for each item represented. Instead of lumping the camp expense, as is usually done, this expense was apportioned over the various phases of the work according to the amount of labor required for each phase.

It should be observed that the cost of no material is included; hence in determining what proportion each item of the expense bears to the total expense of constructing the transmission line it would be necessary to keep this in view. However, considering the items represented, it may be observed that property rights constitute 32 per cent of the total, clearing right-of-way 11.6 per cent, digging and filling holes for tower legs 10.7 per cent, surveying 8½ per cent, and building up towers 8.2 per cent. In regard to digging holes 22 per cent of the total number of poles were in solid granite, making it necessary to drill and shoot. All the remaining expenses are of less proportion, ranking in about the following order: Wood paid for, stringing conductors and ground wires, time and expenses of agents, hauling towers, crop damage, unloading and hauling copper conductors, setting bases, unloading and checking towers, unloading and hauling insulators, distributing miscellaneous material and tools.

The foregoing analysis indicates very closely where the greatest attention must be directed if the expenses of transmission and line construction are to be reduced.

The low cost of erecting the towers is attributed to the method employed. It is known as the unit method. Each gang for constructing these towers consisted of a foreman, two erecting crews of eight men each, one anchor setting crew of three men and sufficient men to dig and fill the holes with the anchors, the number depending upon the character of the soil encountered. One skilled and two unskilled laborers place the anchor. Templates were furnished, made up mostly of



RELATIVE COSTS OF SECURING AND PREPARING RIGHT-OF-WAY AND ERECTING TWO-CIRCUIT TOWERS (EXCLUSIVE OF MATERIALS)

Based on 80-mile section of double-circuit, 100,000-volt steel-tower line carrying six No. 2/0 conductors and one ⅜-in. steel ground wire.

tower members, but it was found that the anchors could be placed without the use of templates, and they were therefore seldom used. The surveying party placed one stake at the center location for each tower and one at each side in the direction of the line.

Instead of assembling each tower on the ground in the usual manner and then hoisting it, the towers were built up entirely from the ground. This was made possible by making the splices and connections so simple and at such places that they could be easily connected while working upon the tower. Each erecting crew had four ground men and four men who could work above ground. After the bottom section of the tower was completely erected the erection crew was augmented to eight men, one man working on each corner of the tower and four remaining on the ground. One ground man serves as a dead man for a guide line attachment to the top of the tower and another serves on a tag line attached to the piece to be raised. The two remaining ground men attach and hoist the various members by means of a single block and line connected to the top of the pole.

### CREW OF EIGHT MEN ERECTS THREE TOWERS A DAY

When the tower is completely assembled and the insulators are hung the four men who worked on the tower above ground start at the top and work down, tightening every bolt. The four ground men proceed to erect the first-story section of the next tower. After some experience one crew of eight men has erected as many as three towers per day.

On the particular line to which the diagram refers there were ten towers per mile on the average. The towers were specially designed and fabricated for this system of erection by the Riter-Conley Company.

## Setting Poles with Earth-Boring Machines

THE Detroit Edison Company has had splendid success with earth-boring machines and finds that two such machines care for the extension needs of the whole system. Poles are assembled with arms and hardware in place, and recently four men, one machine and six back fillers placed 133 35-ft. poles in one day. In January about 1,800 poles were set, and the remodeled International earth-boring machines have given good service for several years.

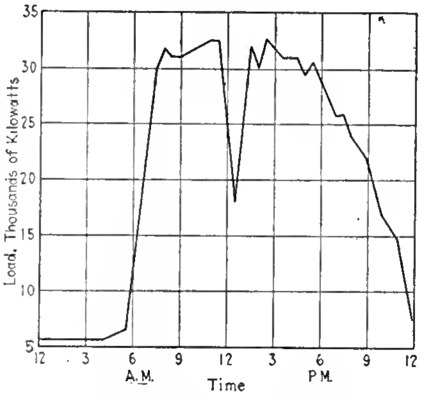
## Fuel Cost 72 per Cent of Production Expense

DESPITE the increase in output which features central-station development and the improvement in even peak-load curves apparent in many plants, fuel cost remains the chief burden of production expense.



INDUSTRIAL LOAD OVERCOMES HOLIDAY PEAK AND AIDS PLANT ECONOMY

The accompanying production costs of the Worcester (Mass.) Electric Light Company for the year 1922 are typical. The plant is about 50 miles inland with no tidewater facilities for fuel handling and has a present rating of 55,600 kva. Six Stirling, two Edge Moor and six Bigelow-Hornsby boilers are in service, the steam pressure being 200 lb. and the superheat 100 deg. F. Eight-retort and fourteen-retort Riley stokers are used on the later boilers, Taylors on older units and Cox stokers on equipment burning anthracite.

During the year the company burned 66,956 tons of bituminous coal at a cost of $7.752 per ton and 13,613 tons of anthracite at $4.52. Two 7,800-kva. and two 20,000-kva. turbine units are installed, and the station output for the year was 73,256,100 kw.-hr. Itemized production costs at the station are given in the accompanying table.

The maximum load on the plant was 32,600 kw. and the year's load factor 25.6 per cent. The production cost was 1.097 cents per kilowatt-hour, of which 7.93 mills represented fuel expense. The accompanying load curve, taken Dec. 22, 1922, emphasizes the importance of power business to this plant, which sold during the year more than 39,000,000 kw.-hr. for power as against slightly under 18,000,000 kw.-hr. for commercial lighting. About 9,000,000 kw.-hr. was purchased from other companies.

## Frozen Water in Generator Loosens Laminations

THE article on "Generator Breakdown from Loose Laminations" in the Feb. 24 issue of the ELECTRICAL WORLD, page 461, recalls an expensive experience with same results but from a different cause. While replacing an obsolete and unsatisfactory horizontal turbine with another in one of the Malone Light & Power Company's stations it became necessary to move the generator from its foundation to one side of the building. This was done in the winter. The power house being built into the side of a rock bank the wheels had to be lowered through the roof. During this time bad weather was encountered, and in some way water was allowed to get into the generator, which froze to such an extent that, as was afterward determined, the laminations were forced apart, loosening them so that when the machine was put into operation trouble was experienced with grounded coils.

PRODUCTION EXPENSES FOR 1922 FOR A 55,600-KVA. STATION

| | Total Expense | Expense per Kw.-Hr., Cents | Per Cent of Total |
|---|---|---|---|
| Superintendence | $17,058 | 0.0233 | 2.13 |

During the twelve years this generator has been in operation we have never been able to stop the vibrating of the laminations, although it has been overhauled several times and once was completely rewound.

In reference to the articles appearing in the ELECTRICAL WORLD under the title "Extracts from an Operating Code," the writer feels that they are of great benefit to central-station men and have added a value to the paper which cannot be estimated.

## Wound-Rotor Induction Motor Generators

WHEN starting wound-rotor induction motor generators from the alternating-current side with starting resistance the secondary current is limited by connecting the starting resistance in series with the secondary winding. By transformer action this limiting of the secondary current limits the primary current to a safe value even with full voltage impressed on the primary. Moreover, as the speed increases the current decreases because of the effect of counter-electromotive force; therefore the resistance is cut out, step by step, until full speed is reached with all resistance cut out. In some cases after the starting resistance has been completely cut out the collector rings are short-circuited and the brushes raised.

For starting and shutting down this type of machine, the Philadelphia Electric Company has issued the following rules to be followed by its employees:

### STARTING

1. Make sure that the controller is in the starting position, and that the brushes are down on the rings.
2. Choose the alternating-current bus switch. The motor should then turn over.
3. As the speed of the motor increases cut out successively the steps of the starting resistance with the controller.
4. When running speed has been reached lift the brushes from the collector rings. This operation also short-circuits the rings by means of a short-circuiting bar.
5. After lifting the brushes, place the controller back in the starting position.
6. Close the generator field switch.
7. If the generator is compound-wound, close the equalizer switch.
8. Adjust the direct-current voltage to that of the bus and close the circuit breakers and the negative and positive machine switches.

### SHUTTING DOWN

1. Reduce the load on the machine to be taken off to as low a value as possible.
2. Trip the direct-current circuit breakers and the machine and equalizer switches.
3. Open the alternating-current bus switch.
4. Lower the brushes to the collector rings.

## Instructions for Taking a Boiler Off the Line

ACCORDING to the operating code of the Philadelphia Electric Company, points to be watched in taking a boiler out of service are (1) that the water does not get low after steaming has stopped and the fire is still burning; (2) that the boiler and setting are not cooled too rapidly, and (3) that all precautions are taken to block off outside sources of pressure, such as steam, feed water, blowdown and soot blowers, for the sake of personal safety and protection when the boiler is opened up. Following are the instructions for taking the boiler off the line:

1. Cut off the coal feed pipe.
2. Set the change-over valve on the waterback line for raw water.
3. Run the coal-feed pipes and hopper empty.
4. Cut off the stokers.
5. Shut off feed-water valves, keeping the water in sight above the nut on the gage glass.
6. After the coal in the furance is burned out, cut off all forced draft.
7. Shut off the spray line in clinker-crusher pit.
8. Stop both the induced and forced draft fans.
9. As the steam pressure drops shut the main stop valve.
10. Close the trap-line valve above the automatic non-return valve.
11. Lock the automatic non-return valve.
12. Open the vent valves on the superheater and open the drain valves between the main stop and automatic non-return valves.
13. Close the stack damper.
14. Shut off the waterback feed and discharge valves after the waterback soot chamber has been cleaned.
15. Empty the boiler through the blow-off valves when the setting has cooled. The superheater drain valves on the other boilers must be closed while this is being done.
16. When the boiler is empty, see that the safety stop valve in the blow-off line is closed and close all blow-off valves and cocks.
17. Hang danger signs on the main stop, main feed, blow-off valves and control board.

## Stimulating Initiative and Placing Responsibility

ASKED as to what he considered the best method of making men develop within a company, one department head of a central-station company, who is a very able organizer and supervisor of men, said: "It is getting them to think." This is not always as simple as it sounds, but he suggests one method which has extensive application.

Every company has its mishaps and interruptions to service in varying degrees. Instead of himself anticipating what may happen and how the trouble shall be handled, the department head referred to puts the responsibility up to the men or man who may have to handle the problem—sometimes the boiler-room foreman, sometimes the switchboard operator, etc. He asks each one to imagine what might happen and how he would handle the trouble if it developed. Even if the man to whom the responsibility is given does not use good judgment the first time, it has been found that the mental process may stimulate his imagination and that this plus experience will bring good judgment. The department head makes it a point to go over these suggestions with the originator personally to ascertain why certain conclusions were reached and, where judgment is erroneous, to draw out a better suggestion.

This method has been found not only to make the men think more clearly about their jobs and plan for future contingencies, which is always a benefit when emergencies arise, but it lessens the monotony of certain jobs and makes the men who fill them feel that, after all, they are more than automatons.

To force men to think along these lines this department head always takes up with the man in charge any serious interruption or trouble after it has been cleared and reviews the situation to make certain that any lessons to be learned are absorbed. He also impresses it upon the men that avoidable interruptions are charged against them and that these interruptions can be minimized by constantly thinking over what may happen and how it shall be handled.

## Park Cable Used Throughout St. Louis Parks

BY MEANS of buried or "park" cable the city of St. Louis has recently completed the work of supplying electricity to more than 3,400 ornamental lighting posts along the highways of its park system. These cables are single-conductor, insulated with 30 per cent rubber compound for 1,500 volts, and are protected against moisture by lead sheathing and against mechanical injury by spirally wound steel-tape armor. The trench in which the cables are buried is 2 ft. deep.

An unusual feature of this extensive installation is the fact that the trenches were dug with caterpillar trenching machines. The conditions in the parks are almost ideal for the efficient operation of such machines, and as almost 800,000 ft. of trench was dug, the economy was very substantial. Another interesting feature was the method of mounting six reels on a motor truck and paying out the cable as the truck slowly progressed along the line of the trench. The manner in which this was accomplished is shown in the composite picture on the front cover. The other photographs show the caterpillar trenching machine in operation and a view of a completed post.

It may be wondered why it should take nearly 800,000 ft. of trench and cable for 3,400 posts. This is because a separate cable has been provided for each side of the road, forming two independent series circuits, so that if anything happens to one circuit there will still be lights on the other side. Where the roads curve the lights are all placed on the outside of the bend and connected to the two cables in such a manner that only alternate lights will be extinguished if either of the circuits fails. It is evident that the city engineer is a progressive advocate of safe highways and means to guard against accidents due to insufficient lighting.

COST OF INSTALLING STREET-LIGHTING SYSTEM WITH 3,423 POSTS

| | Cost per Post |
|---|---|
| Labor cost of trenching, laying in cable, filling in, digging post holes, setting and equipping posts, splicing, boring under streets where necessary, repairing road surfaces and curbs, fitting up substations, etc. | $35.44 |
| Posts (made by city) | 15.23 |
| General warehouse expense, including electrical work on poles and switchboards, painting, loading and unloading, etc. | 3.23 |
| Cost of cable | 40.00 |
| Total cost per post (average of 3,423) | $93.90 |

That this method of lighting is not excessively expensive for a permanent installation where safety and appearance are of prime importance is shown by the costs in the accompanying table. The figure—$93.90 per post—includes everything except the cost of transformers and transformer houses.

The reasonableness of this figure is largely due to the low cost of trenching and laying the cable in the trench and the careful study of details. For instance, it was found that a saving of $2 per post could be effected by stripping the armor off the park cable and running it directly to the top of each post instead of using special wire in the posts. This not only eliminated two splices at the bottom of each post but also did away with the necessity of making an excavation at the base of each post large enough for a splicer to work in.

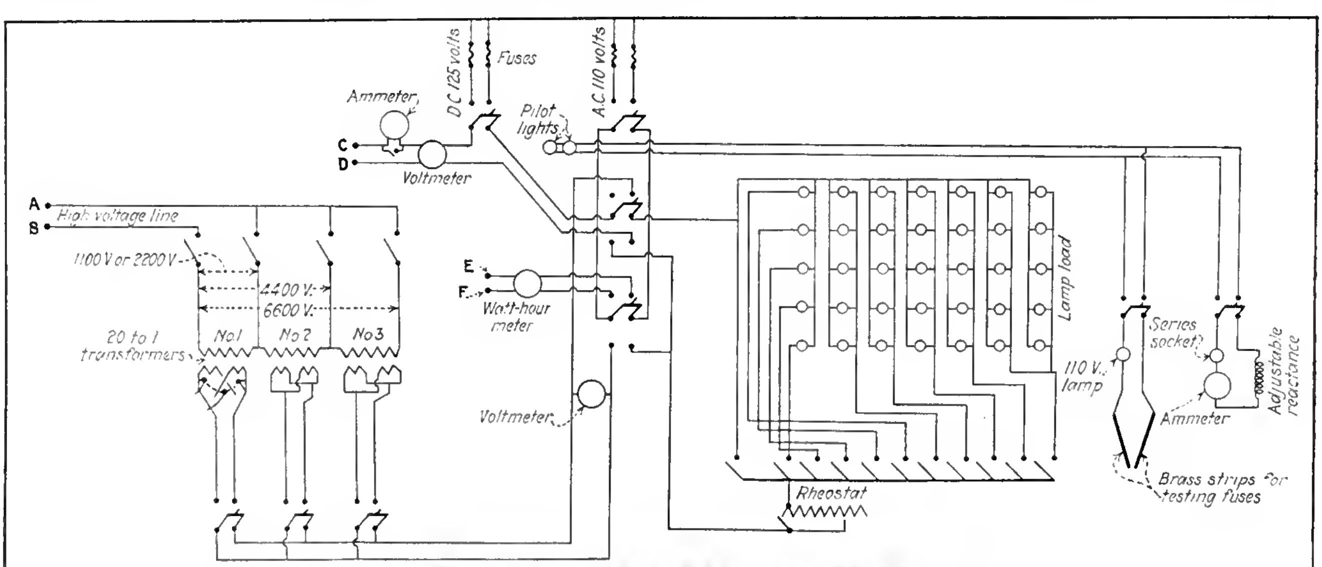
## Transformer Testing Apparatus

### Panel Developed by Stamford Gas & Electric Company Utilized to Test Equipment in Minimum Time Has Worked Out Very Successfully

A TEST board for transformers, arc lights, etc., that has been in use by the Stamford (Conn.) Gas & Electric Company for several years and has proved very satisfactory is shown in the accompanying illustrations. The equipment is made up of standard wiring parts (sockets, snap and knife switches, etc.), three small line transformers and a home-made adjustable reactance coil for incandescent-street-lamp work. At the left of the diagram is shown the arrangement of the three 10 to 1 or 20 to 1 transformers, which, being energized from the 110-volt alternating-current source, can give 1,100, 2,200, 4,400 or 6,600 volts pressures for transformers or other insulation testing at the terminals *AB*.

At the right of the diagram and having the terminals *EF* is an in-



PANEL LAYOUT FOR TESTING TRANSFORMERS, STREET LIGHTS AND FUSES

tegrating kilowatt-hour meter which is used for obtaining the transformer no-load losses. There are two sources of energy supply, one service being at 125 volts direct current and the other at 110 volts alternating current. The former is used primarily for the testing and adjustment of magnetite-arc lamps and can be supplied at the terminals *CD* either at 125 volts or at a voltage controlled by the lamp load. This lamp load can also be inserted in the line feeding the testing transformers to limit the current on the breaking-down test for insulation. At the bottom of the lamp-load diagram is shown a small adjustable rheostat used for accurate voltage adjustment in setting the shunt-coil lift on direct-current arc lamps. At the right of the lamp bank is a device for testing cartridge fuses, and at the extreme right is an adjustable reactor for testing series alternating-current lamps and street-lighting transformers.

### All Transformers Passing Through Storeroom Tested

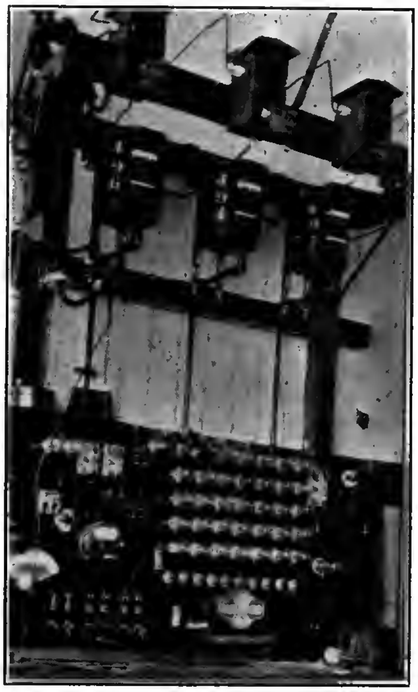
The routine use of the board for transformer testing is the same for new transformers as for those that have been on the lines and are brought in for load changes or on account of breakdown. All transformers passing through the storeroom, whether new, changed or apparently burned out, are tested and overhauled. Our system has two primary distribution voltages, the greater part operating at 2,200 volts delta and some at 4,400 volts delta-connected, three-phase. All transformers used on the latter have double primary coils and a terminal board for series or multiple operation.

The first operation in testing consists of putting 2,200 volts on the primary of the transformer under test and examining the secondary voltage. This is quite important, especially on transformers that have been hit by lightning and are liable to have part of their primary coils cut out.

If this voltage proves satisfactory, the insulation is tested between the high-tension coils and the case, the low-tension coils and case, and between the high-tension and the low-tension coils. In every case all terminals of each coil are connected together, the test being made with 4,400 volts (6,600 volts for transformers with double primaries).

The transformer is now repaired if necessary, the core pulled out and the coils scraped if badly covered with carbonized oil. The terminal boards in transformers that are relics of 1,100-volt primary days and any paper tags that may have been glued to the cover are removed, the latter especially being a fertile source of trouble on the older types of transformers.

After testing, cleaning and painting the case, the transformer is



COMPACTNESS A GOOD FEATURE OF THIS TESTING EQUIPMENT

again tested for insulation and is then tested for no-load loss. This consists of applying 110 volts to the secondary of the transformer through a kilowatt-hour meter and reading the input by timing the disk rotation with a stop-watch. The watts lost are recorded on a transformer history card, no attempt being made to separate these data into component parts or to correct for the actual value of magnetic flux the transformer would require. This must be done before the no-load loss of various transformers may be even approximately compared, as part of our line transformers (power) are of 9 or 18 to 1 ratio and part (lighting transformers) 10 or 20 to 1 ratio, and the no-load losses may be roughly compared by proportioning the square of the secondary voltages.

No tests for heating or regulation are made in routine. The writer does not believe it worth the time it would take on transformers of standard manufacturers, whose designs are well determined, and which have stood the insulation test.

The test board is located on the second floor of a building served by a power elevator so that line transformers of practically any size can be handled easily.

### Portable Test Outfit

In case handling facilities are not available, a testing apparatus which the writer devised a few years ago and used at the Hackensack office of the Public Service Electric Company of New Jersey is very satisfactory and convenient.

Two 1-kva. transformers were mounted on a wooden platform about 8 ft. square and fitted with casters. On one side of the platform was a vertical wooden switchboard about 2 ft. high and 3 ft. wide, which held a fused 30-amp., 110-volt switch, a small adjustable 110-volt circuit breaker and three plug switches, such as are used on series street-lighting panels. The low-tension sides of the transformers were permanently connected in multiple through the switch and circuit breaker and the high-tension sides were connected in series, leads being brought to the plug switches and from them to terminals. By this arrangement test voltages of 2,200 volts or 4,400 volts were obtained, and either transformer was large enough to supply exciting current to any line transformer for testing its ratio. This set could be carried quite easily from place to place and used wherever 110-volt service was available.

Chester S. Wendell,
General Foreman Line Department,
Stamford Gas & Electric Company,
Stamford, Conn.

## Rubber-Covered Wire for Underground Service

About five years ago the Buffalo General Electric Company installed rubber-covered wire for the underground street-lighting service. The cost ratio was about three to one in favor of the rubber-covered wire. No. 8 wire, rated at 5,000 volts with $\frac{7}{32}$-in. rubber insulation (30 per cent para rubber), was used in a $2\frac{1}{2}$-in. fiber duct laid between the lamp pedestals.

Each length of wire was pulled from one lamp to the next. Some of these conductors have frequently lain in water or in ice, yet the service has been completely satisfactory and the practice has been continued for later installations.

## Grading Utilities on Service Rules*

**Means Adopted by the Railroad Commission of Wisconsin for Maintaining Service Standards and Determining Relative Performance of Lighting Companies**

By Charles B. Hayden
Service Engineer Wisconsin Railroad Commission

THE first order issued by the Railroad Commission of Wisconsin prescribing certain requirements for gas and electric service was made effective in 1908. The second order, which is now in effect, was issued in 1913. Very soon after the last order came out, early in 1914, the service department began grading the gas and electric utilities, and about a year or so later, in 1915 or 1916, standings were given to the telephone utilities. Up to this time we have not attempted to grade the water utilities, although service rules have been in effect for about four years. There does not appear to be any great advantage, as far as our department is concerned, in applying grades to the service of water utilities, since the quality of service with different municipal and private utilities does not vary much.

When this system of grading was started it was not with the thought of applying to the regulation of utilities the time-tried plan of grading as used in our school system, where it is absolutely necessary in order to keep the pupils placed according to the achievement and growth which each one makes; nor was it our idea that each utility would be expected to run the gamut of conditions, passing and honor marks through the various years of the course, with the possibility of failure up to the final graduation. It was done because it afforded a means of keeping track of the utilities according to the service standards which had been established, and if possible to determine whether there was any increase or decrease in the degree of compliance from year to year, of the utilities throughout the state or of any one utility in particular.

*Abstract of paper presented at conference of railway and utility engineers at Washington, D. C., March 2, 1923.

After use in this way for some time it was determined to try out the scheme on the unsuspecting utilities, and it was found that the results were decidedly good. The utilities which received high rank were very much pleased and in almost every case put forth efforts to improve their position or at any event maintain it. To be sure, some jealousy developed, but for the most part the best of feeling existed and a friendly rivalry sprang up for the high-rank positions.

The rules do not have equal relation to the quality of the service; for instance, the meter-history record has no particular bearing on service, while the pressure conditions and meter-testing practice will determine greatly the degree of satisfaction felt by the consumer.

The rules are also subject to quite wide interpretation and the inspector must make this decision. To be sure that this will be worked out uniformly by the engineer inspectors —all of our inspectors are engineering college graduates—conferences have been held about twice a year, when sample inspection reports receive a mark; i.e., each rule received a percentage from each inspector according to the report. These marks are then compared and the differences argued out by the several inspectors, until it is possible to have a close approximation to uniformity.

RULES REGARDING ELECTRIC SERVICE

| Number of Rule | Subject | Per Cent Credit | Rank |
|---|---|---|---|
| 14. | Creeping meters | 4 | 6 |
| 15. | Accuracy of meters | 7 | 3 |
| 16. | Installation tests | 5 | 5 |
| 17. | Periodic tests | 14 | 2 |
| 18. | Meter-testing records | 5 | 5 |
| 19. | Meter-testing equipment | 5 | 5 |
| 20. | Request tests | 4 | 6 |
| 21. | Referee tests | .. | .. |
| 22. | Meter readings on bills | 4 | 6 |
| 23. | Interruptions | 18 | 1 |
| 24. | Station records | 6 | 4 |
| 25. | Pressure and voltage variation | 18 | 1 |
| 26. | Pressure and voltage surveys | 6 | 4 |
| 27. | Information | 4 | 6 |

In order to avoid too great variation, the different rules are divided, where this is possible, into their elements and a portion of the percentage is allowed for each subdivision. In the detailed explanation of the markings this will be followed out. The weighing of the various rules for gas and electric service was decided after a number of conferences of all the inspectors, and we believe that the result is reasonably proper.

For electric service, interruption and voltage variation hold first place, periodic tests second, accuracy of meters third, and the rest of the rules are of about equal value. The table gives an idea of the plan.

It is obvious that the instance would be rare of a utility which could give perfect voltage or pressure conditions over its entire system all of the time, but it is possible that such a condition could exist. Naturally the full allowance of 18 per cent is seldom if ever given. An analysis of the company's records and of the inspector's tests will give a good idea of the extent of poor pressure conditions, and penalties are imposed in proportion to the extent and to the importance of the business affected. With most of the rules, however, it is quite possible for the utility fully to meet the requirements and receive full credit.

Some of the rules applying to electric companies, with explanation of the reasons for the grades given, follow:

*Interruptions, 18 per Cent (Rule 23).* —Each electric utility shall make all reasonable efforts to eliminate interruptions in service and when such interruptions occur shall endeavor to re-establish service with the shortest possible delay. Whenever the service is interrupted for the purpose of working on lines or equipment this shall be done at a time which will cause the least inconvenience to consumers, and those most seriously affected by such interruption shall, if possible, be notified in advance.

Compliance with this rule is based

upon the number of interruptions to service, the length of interruptions, and on whether they are reasonably avoidable or not. Some weight is also given to the class of consumers served and whether or not the interruptions affect the whole, a major portion or only a small part of the system. Interruptions of the whole service are classed as follows in per cent credit: No interruptions, 18; few short, unavoidable interruptions, 18; few long unavoidable interruptions, 16-17; few short, avoidable interruptions, 15; few long avoidable interruptions, 12; many short, unavoidable interruptions, 12; many long, unavoidable interruptions, 10; many short, avoidable interruptions, 5; many long, avoidable interruptions, 0.

*Station Records, 6 per Cent (Rule 24).* — Each utility furnishing electric service shall keep a record of the time of starting and shutting down power-station equipment and feeders, together with the indication of the principal switchboard instruments, at sufficiently frequent intervals to show the characteristics of the load, and shall maintain a record of all interruptions of service upon the entire system or major divisions of its system, and include in such record time, duration and cause of each interruption.

A complete station log will constitute full compliance, but if it lack a record of interruptions, showing cause, duration, etc., only half to two-thirds credit will be given.

*Pressure and Voltage Variation, 18 per Cent (Rule 25).*—Each electric utility operating in a city having a population of 1,500 or more shall adopt a standard voltage for the entire constant-potential system and shall maintain the voltage within 3 per cent of such standard on all lighting circuits during lighting hours; on power circuits and during other than lighting hours the voltage shall be maintained within 10 per cent of the standard. All other electric utilities shall maintain their voltage regulation on constant-potential circuits during lighting hours so that the maximum voltage furnished any consumer shall not be more than 6 per cent above the minimum voltage at that consumer's cut-out.

A large percentage, about 15, is given if the pressure requirements are met during lighting hours and 3 per cent for the remainder of the twenty-four hours. With utilities not giving service except during lighting hours compliance is figured on the whole 18 per cent. Deductions are made depending on the amount of variation from the standard voltage and for variations below the standard on parts of the system.

*Pressure and Voltage Surveys, 6 per Cent (Rule 26).*—Each utility furnishing electric service shall provide itself with one or more portable indicating voltmeters, and each utility serving more than 250 consumers shall have one or more portable graphic recording voltmeters, these instruments to be of a type and capacity suited to the voltage supplied. Each of the utilities shall make a sufficient number of voltage surveys to indicate the service furnished from each transformer and feeder and to satisfy the commission of its compliance with the voltage requirements, and those having graphic recording voltmeters shall keep at least one of these voltmeters in continuous service at the plant, office or some consumer's premises. All voltage records are to be kept open for public inspection.

The compliance with this rule depends on whether or not the utility is fully equipped with recording gages and the judgment used in making the surveys as to the proper time and the location of the gages, etc., and whether or not a complete and available record is kept for inspection. Deductions will be made depending on the degree to which the inspector feels that the surveys are incomplete.

*Information, 4 per Cent (Rule 27).*—Each utility supplying electric service shall specifically inform each of its consumers as to the conditions under which efficient service may be secured from its system and render its consumers reasonable assistance in securing incandescent lamps and other appliances best adapted to the service furnished.

A utility is required by this rule to advise the consumers properly regarding the best lamps and motors to use, etc., and, in general, to show a proper attitude to the public. The public policy of the utility is another factor which is considered in connection with this rule. The degree of compliance must be determined from observation by the inspector.

## Alabama Power Displays Broadcasting Results

THE window shown here was decorated by the Alabama Power Company to show the people of Birmingham the scope of WSY, the new broadcasting station which the company recently installed in a department store in that city. Every place from which letters have come is marked on a map of the Western Hemisphere with a red ribbon which extends down to the floor pointing to the letter itself, which is opened so that it may be read with ease. There are several hundred of these letters from all sections of the country, as far west as the Pacific Coast, northeast to Maine and south to Cuba. One ribbon indicated a point in Mexico 1,500 miles from Birmingham, and another a point in Canada 2,000 miles away. The display attracted much interested attention during the time it remained in the window.

WINDOW DISPLAY SHOWS SCOPE OF RADIO SERVICE

## Weekly Meter Readings Prevent Disputes

THE Ohio Gas & Electric Company, Middletown, Ohio, L. E. Marshall, general manager, has adopted a practice of reading the meters of large consumers weekly. When a consumer uses so much power that the monthly bills are well up into the hundreds of dollars, no company can afford to have debates as to the accuracy of his bills. By the weekly reading of meters it is

possible to check any unusual use of power, real or apparent, and to make note of it or make adjustment in case it is a meter error, before any large sum is involved. This practice has been followed for three years, and during that time there has not been a disputed bill, whereas before there were occasional disputes with large customers.

Bills are rendered on the usual monthly basis. The weekly reading is merely an insurance measure, and it has proved well worth the expense and trouble involved by anticipating complaints on high bills.

# Inspections Build Business and Good Will

## Ten Years Experience by a Michigan Utility Indicates Value of Cordial Relationships—Inspector Sells Lamps and Appliances from an Electric Truck

By H. A. Fee
President Citizens' Light & Power Company, Adrian, Mich.

MAINTAINING customer good will and keeping energy-consuming devices on the line is a problem of no less importance to a small public utility than it is to a utility serving several hundred thousand customers. Often the personal relationships between a small utility and its customers can be, if properly handled, much more intimate and cordial than is possible with a larger utility. The extent to which a small utility will benefit by these relationships will depend upon its service to its customers "above and beyond its actual call of duty."

One of the most effective methods of having consumers view their local company in a favorable light is a free inspection service. Such a service has now been in use in Adrian, a city of twelve thousand inhabitants in lower Michigan, since 1912. During 1922 our inspector made twelve thousand visits among our three thousand consumers. This inspector follows the regular meter route with an electric truck carrying lamps and appliances, which he demonstrates and sells. He works the territory on schedule so that four complete inspections are made yearly. This work has continued ever since it was started, with the exception of the war period. At that time our inspector entered the nation's service, but the inspection trips were resumed in the year 1919 after customers had urged that they be restored.

Although in the beginning the inspector reported frequent trouble in gaining entrance because of housewives' suspicion of the company's object, the service is now so popular that oftentimes a customer will call up to determine just when the inspector will be around again. With such intimate contact with customers no introduction card is presented, although the inspector always carries credentials explaining the purpose of the investigating service.

### Note Book Lists Appliances

A loose-leaf notebook is carried by the inspector which gives the name and address of each customer. It also has room for four additional names in case any new tenants move in. White sheets are used for residential customers, while for commercial users buff colored sheets are used. Space has been provided to enter the number and the wattage of lamps and to list the appliances in use. However, as a result of protests from some residential customers against the visiting of all rooms in search of outlets or to determine the lamp wattages, the inspector now merely asks the number of outlets and figures the residence load on the basis of a 50-watt equivalent per socket. On the reverse side of this sheet columns are provided for the date of inspection, demonstrations and remarks regarding the quality of service. Careful note is made of all comments. If the complaints are not remedied by the inspector on the spot, he refers the subject to the repair department, which issues a regular work order

for repairs. It is also his duty to explain any interruptions to service and to bring about adjustment on real or fancied grievances.

The inspector makes an investigation of the service, looking for low-hanging wires, loose brackets or switches and examines service entrance switches. He also inspects appliances. Minor repairs on appliances, sockets or wiring are made free of charge, but when further repair work is required the device is taken to the store with the customer's permission and repaired, this work being charged for according to the material and labor required. Labor in repairing appliances is generally furnished free, however, provided that the time consumed does not exceed fifteen minutes.

After doing his best in repairing appliances and bringing service to the 100 per-cent mark, the inspector tactfully suggests the use of some other appliance the housewife needs. If she appears interested, he steps out to his truck and brings it in. By effectively demonstrating its use he is often able to overcome reluctance to purchase. The sight of an appliance in actual use in the home often is the main selling point in closing a sale.

The part of the service most appreciated by the customer is the sale of lamps. Customers are prone to forget to buy lamps to replace those burned out and as a result of this forgetfulness get along with a lower consumption of energy than normal, without any desire to practice rigid economy. The fact that most of our sales from the truck are of lamps shows that the service helps to keep the sockets full and in use.

After the day's work the inspector makes out a report showing the number of appliances demonstrated, the number of sales made and the number of hours devoted to inspection. These reports are checked daily by the secretary of the company, who supervises the service. No itemized lists of various types of appliances inspected has been kept, since this would involve extra time for an office clerk in filing and making out reports. The inspector's route books are turned over to a listing clerk who posts upon permanent cards the load data contained therein. From these cards figures are taken when calculating the distribution capacity required by the residential consumers.

From the results of this service in keeping appliances in good working condition, together with the spirit of good will fostered by maintaining an effective contact with the company, we have found that the improved customer relationship more than offsets the expense of the service itself, which last year cost us only $1,692. When the customer is made to feel that the company is directly interested in seeing that he gets good service he soon comes to realize that it is made up of human beings like himself and that its officers and men alike are interested in giving him personal as well as mechanical service. With this attitude bills are cheerfully paid. From our early experience we came to believe that the average customer appreciated the convenience of being able to get new tungsten lamps from the inspector far more than he did the saving he made in the cost per candlepower of his lighting service. It was the personal element of the service that appealed to him, and so beneficial have been the results from our free inspection that we would not think of doing without it. We believe there is no better way of building up good will.

## Telephone Courtesy Shows Results

As PART of a "courtesy" campaign the Scranton (Pa.) Electric Company has placed the card reproduced here on the transmitters of all the telephones in its general and departmental offices. This action is an outgrowth of the theory that "the voice with the smile wins," and almost immediate results were real-

CARD PROMOTES TELEPHONE COURTESY

ized by the company in the form of commendatory letters from customers who had noticed the cards and were moved to compliment the company on the general courtesy of its employees.

## What Other Companies Are Doing

**Chicago, Ill.** — A booklet, "Electrify Your Savings," has been prepared by the Commonwealth Edison Company for increasing the sale of stock by the company's investment department, the Utility Securities Company. The fourteen pages are given over to an interesting conversational narrative in which a suburbanite discusses the advantages and value of holding the company's stock, which has been sold to 29,000 persons.

**Birmingham, Ala.**—The Alabama Power Company is exhibiting in every state in the country a series of three industrial moving pictures showing the industrial and manufacturing plants of Alabama. These pictures are being sent out by the publicity department of the company to every national industrial exposition held in the country as a part of its program to attract new industries to the state.

**Augusta, Me.**—The Central Maine Power Company will rebuild its offices and stockroom at Waterville, recently destroyed by fire. A number of new electric stores have recently been opened on the system and the outlook is excellent for the year's appliance business.

**Philadelphia, Pa.** — During its annual spring washing machine campaign, which closed on March 31, the Philadelphia Electric Company sold 900 washing machines. Other types of washers sold brought the total to 1,000 for the six weeks. On the closing day 101 machines were sold, the day's total sales amounting to $19,000. Sales for March totaled $175,000, the largest month's business in the history of the company's electric shop. Merchandise sales for the first three months this year show an increase of 80 per cent over the same period in 1922.

**Franklin, Mass.**—Active cultivation of electric range business by the Union Light & Power Company has resulted in the installation of 145 ranges on its system, the total number of customers being about 4,000. E. S. Hamblen, local manager, states that the range "bogey" this year is 100 and that an installment proposition of $99 per range wired in place is about to be launched. The company is under the general management of C. D. Parker & Company, Boston.

# Digest of Electrical Literature

**Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World**

## Hydro-Electric Development and Steam Equipment

*Electric Steam Generators.*—W. P. MUIR.—The author describes what is asserted to be the largest and most successful installation of the water-resistance electrode type of electric generator. This type has been used in Europe for a number of years and was recently introduced into Canada and further developed by the Shawinigan Water & Power Company, Shawinigan Falls, Quebec. Excess hydro-electric power is sold to the Laurentide Company, where two units, each consisting of three sections connected on a 6,600-volt, three-phase circuit, produce steam. Each generator has a normal capacity of 25,000 kw. and 35,000 kw. during overload. The generators are capable of producing 50 tons of steam per hour. —*Power*, Feb. 6, 1923.

*Trent River Development Yields 10,000 Hp. to Central Ontario.*—A new hydro-electric generating station of 10,000-hp. capacity was recently put into operation at Ranney's Falls on the Trent River in Ontario. This station is the most recent addition to a chain of seven developments that supply energy to the Central Ontario system of the Hydro-Electric Power Commission of Ontario. A head of 48 ft. is utilized in two turbines of the vertical single-runner type, directly connected to 4,500-kva. generators. Details of the turbine and generator installations, relay operation and switchboard accommodations are given.—*Electrical News*, March 1, 1923.

## Generation, Control and Switching

*Static Condensers.*—C. MARMY.—The design of the usual type of static condensers, wherein layers of metal are placed mechanically upon dielectrics of paper, mica or glass, has resulted very frequently in failures due to either inclosed air pockets or the so-called "border effect," both causing a slow brush discharge which leads sooner or later to a puncture. The paper under notice describes a type of condenser which, it is claimed, avoids these two shortcomings. Upon both sides of a narrow and very long ribbon of "cellon," a substance similar to celluloid but non-inflammable, a chemical metallic deposit is made somewhat narrower than the width of the ribbon. Judging from the illustrations, this ribbon has about the dimensions of a standard motion-picture film. This ribbon is wound upon small bobbins, several of which are stacked up, connected in series and placed within an insulating tube, representing a condenser unit. For outdoor service these units are capped with a rain-shedding porcelain petticoat. By a special method, the nature of which is withheld, the edges of the metallic deposit are made of a very high ohmic resistance, so that the potential near the edges of the condenser ribbon is much smaller than in its middle portion, thereby avoiding the dangerous "border effect."—*Bulletin Association Suisse des Electriciens*, January, 1923.

*Automatic Control of Synchronous Industrial Motor-Generator Sets.* — An article describing a full automatic-control equipment for a 2,300-volt synchronous motor driving a direct-current generator, which is also automatically controlled by standard apparatus. A complete wiring diagram of both the motor and generator is given.—*Power*, Feb. 13, 1923.

*Frequency Doubling Devices.* — Y. WATANA. — Wave distortion of two highly saturated transformers and current-rectifying apparatus are two methods for obtaining double frequency. Both are based on the fact that when the magnetic flux through a coil undergoes the change of a half wave of a sinusoidal curve, lasting only for that half period, a complete wave of current of nearly double frequency may flow through the coil circuit. The writer shows that the latter method can be greatly improved by means of direct-current magnetization applied in the opposite direction to the magnetization of the rectified current. He also treats experimentally the direct method of deriving alternating currents of higher harmonics from a sinusoidal current source. — *Journal of the Institute of Electrical Engineers of Japan*, February, 1923.

## Transmission, Substations and Distribution

*Possibilities of Transmission by Underground Cables at* 100,000 *Volts to* 150,000 *Volts.*—A. M. TAYLOR.—This paper is primarily a plea for the use of single-phase cables. The effect of separating the cores is considered, both in its relation to easing the potential gradient and in relation to eddy currents induced in the lead sheathing. The gain effected by employing "intersheaths" is pointed out, and the author's proposals for obviating the disadvantages of intersheaths by combining their employment with a six-phase transmission are considered. An actual transmission of 50,000 kw. at 100,000 volts over a distance of 30 miles is worked out in detail and compared with a similar transmission at 30,000 volts. The principal conclusions arrived at are: (1) Reliability under the six-phase three-phase system very greatly increased, as compared with plain single-core cables (as at Gennevilliers) or with three-phase cables for equal voltage. (2) The author's arrangements will permit loads of poor power factor to be taken up, with positive gain in efficiency and regulation. (3) The maximum voltage gradient being no greater with 100,000 volts than with 30,000 volts, such transmissions can be undertaken immediately the cable makers are in a position to guarantee the cables. (4) The investment in capital outlay proceeds, in the six-phase three-phase scheme, in proportion to the development of the load. (5) The reduction in line-charging current and the improvement in regulation are very considerable, as compared with those for any other proposals.—*Journal of the Institution of (British) Electrical Engineers*, February, 1923.

*Steel Aluminum Cables for Overhead Lines.* — H. KRAUTT. — An elaborate theoretical treatise on the properties of bimetallic cables, primarily dealing with the mechanical relations between the two metals. In spite of the large amount of scientific research work which has been carried on to study the physical properties of steel-aluminum cables, much has yet to be investigated to establish fully the feasibility of the use of these combination conductors. It has been definitely established that results found by calculations or from using short cable lengths in laboratories differ considerably from actual results with long transmission lines of the same material. The main difficulties are found in inability to measure accurately the existing stresses in the two metals and in the lack of exactness in measuring the cable temperature during artificial heating of the conductor. — *Elektrotechnik und Maschinenbau*, Feb. 18, 1923.

## Units, Measurements and Instruments

*Electric Test Brakes.* — C. REINDL. —To determine the mechanical output of prime movers of electric motors and to test the characteristics of generators the author advocates electric braking methods, describing the equipment. A universal testing apparatus and switchboard which will take care of virtually all routine testing in repair shops is described in full detail. Particular attention is paid to the use of brake dynamos both rotor and stator of which are free to rotate. A lever attached to the stator carries a sliding weight or may be connected to a dynamometer. Providing a lever 710 mm. in length, the mechanical output of the tested motor in horsepower is simply the speed times the weight in kilograms over 1,000. A further simplification may be obtained by having the lever actuate a hydraulic measuring cylinder which is connected to a registering pressure gage. It is suggested that advantage be taken of regenerative braking, which will give a saving of 30 per cent to 40 per cent of the electrical energy otherwise required. A diagram is shown of a testing equip-

ment for automobiles, where the rear wheels of the car stand on large wooden drums, which drive two braking dynamos.—*Elektrische Betrieb*, Jan. 24, 1923.

*Direct-Current Cable-Testing Car.*—W. Pfannkuch. — Testing of underground cables with high-voltage direct current, which eliminates all wattless currents met with when using alternating current, has the advantage of permitting more severe test of the cable and joints. By using direct current the charging energy of the cable has to be supplied only once, so that a very small amount of energy will be sufficient for any length of cable, the time required for the charging being of no importance. A portable plant of this type is described which consists of a 10-kva. single-phase, 220/33,000-volt transformer, one three-phase synchronous motor connected to a Delon type rotating mechanical rectifier, two condensers of 0.01 mf. capacity each and a sphere-gap voltmeter. A maximum of 150,000 volts direct current is obtainable. A voltage regulation from zero to the highest value is achieved by a special design of the synchronous motor, the stator of which can be so turned relative to the rotor that the rectifier will pick up any value of the alternating-current sine wave.—*A. E. G. Mitteilungen*, January, 1923.

## Illumination

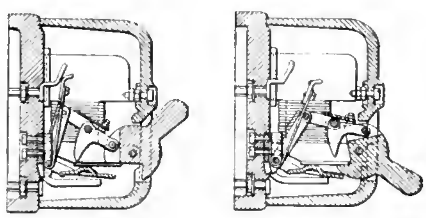
*Illuminating Engineering Society Notes.*—This issue of the *Transactions* includes three papers that were presented at the Swampscott convention last fall, with the complete discussion following their presentation. They are: "A Distribution Photometer of New Design," by C. C. Colby, Jr., and C. M. Doolittle; "The Regular Icosahedron as a Substitute for the Ulbricht Sphere," by K. S. Weaver and B. E. Shackelford, and "Lighthouses and Light Vessels," by S. G. Hibben. Abstracts of these papers may be found in the Electrical World for Oct. 7, 1922, page 783; Oct. 28, 1922, page 948, and Nov. 11, 1922, page 1060, respectively.—*Transactions of the I. E. S.*, March, 1923.

## Motors and Control

*Steel-Mill Cranes and Mill Motors.*—A symposium of six papers dealing with steel-mill crane and motor problems, crane-wiring diagrams, a 120-in. motor-driven plate mill, motor-driven accumulator pumps and foot-operated control for steel mills.—*Proceedings of Association of Iron and Steel Electrical Engineers*, February, 1923.

*Operation of Induction Motors in Cascade.* — H. Cotton. — In a highly mathematical paper the author draws the circle diagram of two induction motors in cascade by elaborating the diagram of one machine functioning under normal conditions. In order to simplify the diagram the case considered is that of ideal motors in which the copper losses are so small that they can be neglected. This means that the generated electromotive force in the main rotor and the back electromotive force in the auxiliary rotor will be equal and opposite. But the directions of rotation of the two rotors are the same, the shafts being mechanically coupled; hence the fluxes which produce these electromotive forces must be in phase with one another when drawn on the same diagram. Moreover, assuming identical windings on the two rotors, the two fluxes must be equal in magnitude.—*Journal of the Institution of (British) Electrical Engineers*, February, 1923.

*Miniature Automatic Breaker.*—As a substitute for fuses in house installations, a small, single-pole automatic switch not much larger than an ordinary wall switch is described. This is shown in the accompanying illustration. The rating of the switch is for 6 amp. and for 10 amp., up to 250 volts. A double-toggle joint brush contact is con-



Instantaneous Automatic Breaker Adaptable for Protecting House Circuits

trolled by the adjustable armature of a small solenoid. The coil acts at the same time as a magnetic blow-out for the arc. On tests the breaker opened on 250-volt short-circuit currents of as high as 1,500 amp. without trouble. It was further demonstrated that the switch will open short-circuit currents of up to 400 amp. from 110 volts to 220 volts quicker than the 25-amp. plug fuse customary in light circuits.—*Elektrotechnische Zeitschrift*, Feb. 15, 1923.

## Traction

*Control of Alternating-Current Locomotives.*—I. Döry.—Electric control of large locomotives with motor capacities of 3,000 hp. or more requiring the handling of currents of 10,000 amp. or more is a difficult problem, and most constructions use contactors which are themselves energized from a master controller. While such a system operates satisfactorily, it lacks the highly desirable positiveness of a direct operation. That is to say, the engineer has no assurance that the contactors will always obey the impulses given from the master controller. It may also happen that one of the usually great number of contactors will stick, upsetting the entire control. It was found during tests that doubling and even trebling of each contactor reduced the current per finger but could not give the required positiveness. Moreover, it introduced a maze of additional connections. Further attempts were made with straight-row contacts and a traveling double brush, and later an auxiliary transformer connected in series with the main transformer came into use. Both designs failed to give the desired results, partly owing to arcing or on account of too heavy weight. Poege developed finally a system which, it is claimed, is both reliable and positive. He connects to the main transformer a regulator with stationary windings and a commutator upon which are arranged a set of brushes which can be shifted upon the circumference of the commutator.—*Elektrotechnik und Maschinenbau*, Jan. 28, 1923.

*Points of Interest About the Capital Traction Company.*—R. H. Dalgleish.—A general idea of the physical characteristics of this property in Washington, D. C., is given, together with information on some of the company's construction and maintenance practices.—*Electric Railway Journal*, Feb. 10, 1923.

## Heat Applications and Material Handling

*Controllers for Ore Unloaders and Ore Bridges.*—L. M. Mortensen.—The author discusses the different motor and controller connections used in conjunction with ore unloaders and ore bridges. The construction and principal characteristics of these machines as they vitally affect the equipment are briefly described.—*Proceedings of the Association of Iron and Steel Electrical Engineers*, February, 1923.

*Arc Welding of Steel Structures.*—F. P. McKibben.—Structural engineers are now giving careful attention to the application of electrical welding to steel structures with the view of guiding the art along safe lines. Up to the present time most electrically welded structures have not been carefully proportioned with proper regard for the stresses to be carried and the strength of parts necessary to carry them. The author gives also a short history of the erection of steel structures by this method, following it with examples of the problems encountered and the method by which these may be overcome.—*Journal of the American Welding Society*, February, 1923.

## Telegraphy, Telephony, Radio and Signals

*Oscillation Engineering Design of Submarine Acoustic Signaling Apparatus.*—W. Hahnemann.—The acoustic systems corresponding to closed oscillatory electric circuits, to radiating electric systems and to coupled circuits are described. The design of submarine signaling transmitters and receivers on an engineering basis is also described and actual installations are discussed. The resemblance of submarine signaling engineering and radio engineering and the relation between these fields are considered. — *Proceedings of the Institute of Radio Engineers*, February, 1923.

*Inverse Duplex System of Amplification.*—B. Phelps.—One of the best-known so-called reflex circuits is a hookup whereby three amplifying tubes are used for three stages of radio and two of audio at the same time, employing a crystal for detection. The diagram for this circuit is given, accompanied with detailed data as to size of condensers and inductances to use.—*Q. S. T.*, March, 1923.

# News of the Industry

**Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men**

## Colorado Ratifies Treaty

**Six of the Seven States Watered by River Are Now in Line—Arizona May Reconsider**

THE Colorado River treaty has been ratified by the Legislature of Colorado and was signed on Monday last by Governor Sweet. Only Arizona of the seven states concerned is now withholding its consent to the agreement. According to statements made by Colorado legislators, Arizona is to reconsider the decision made by her Legislature on March 10, when the bill for ratification was defeated by a tie vote. The treaty, however, could not become effective until its ratification by the new United States Congress, which, unless called in special session, will not meet until Dec. 4.

## De Forest Demonstrates His "Phonofilm"

Before the New York Electrical Society on Wednesday evening of this week Dr. Lee de Forest gave a demonstration of his new "phonofilm," an invention to make voice reproduction with motion pictures practicable by inducing perfect synchronism. The process involves the photographing of sound vibrations on a standard motion-picture film and translation back to sound by electrical means. It was briefly described in the ELECTRICAL WORLD for Aug. 26, 1922, page 442.

"I claim," said Dr. de Forest, "that an entirely new form of screen drama can be worked out, taking advantage of the possibilities of introducing music and voice and appropriate acoustic effects, not necessarily throughout the entire action, but here and there where the effects can be much more startling, or theatrical, if you will, or significant, than is possible by pantomime alone, no matter how cleverly such can be worked out."

## Connecticut Power Finances New Transmission Lines

The directors of the Connecticut Power Company last Monday authorized the floating of 7,500 shares of unissued common stock, with a par value of $100 a share. They will be offered to common-stock holders of record in the ratio of one share of new to two of old, stock not taken to be sold at par at the option of the directors.

The stock is to be sold to finance the projected transmission line to the north and a transmission circuit to New Britain. The former, as already told in the ELECTRICAL WORLD, is to extend from the South Meadow up the east bank of the Connecticut River to Springfield and then to Turners Falls, Mass. Right-of-way was obtained some time ago.

## Public Utility Information Bureau for Pennsylvania

Representatives of all branches of the public utility companies of Pennsylvania met at the Bellevue-Stratford, Philadelphia, on Wednesday last, with Philip H. Gadsden, vice-president of the United Gas Improvement Company, as chairman, and virtually decided to establish a State Committee on Public Utility Information along the lines of those existing in many states. A committee composed of four members each from electric light and power, electric railway, telephone and gas companies was appointed to arrange for financing the new body and attend to the other preliminaries. Headquarters will probably be in Philadelphia.

## Alabama Now Has Public Utility Bureau

A number of the leading public utility companies in Alabama last week established a joint information bureau in Birmingham in order to disseminate information regarding the utilities of the state. Leon C. Bradley, formerly city editor of the Birmingham *Age-Herald*, has been made director. Offices will be in the Jefferson County Bank building. The object of the bureau is to keep the people of the state informed at all times on fundamental questions affecting the utilities, according to J. S. Pevear, chairman.

In establishing the bureau, Mr. Pevear said, the utilities realize that the public utility industry has been more or less clouded with mystery and it is in an effort to correct this situation that the bureau has been formed. "It is our purpose," he said, "to conduct a bureau in which complete confidence can be placed, which will collect authoritative data on the industry and disseminate it impartially both to the public and to the utilities themselves. The object of the bureau is to acquaint the people of Alabama as thoroughly as possible with the facts, economic and otherwise, regarding the organizations which furnish them with electric light, power, gas, street-railway and other essential services."

## Oppose Smith Power Bill

**William Barclay Parsons and Others Point Out Its Weaknesses at Committee Hearing**

ADVOCATES and opponents of Governor Smith's water-power bill clashed at a hearing on Wednesday, April 4, before the New York State Senate committee on conservation, and the usual countercharges of socialism and monopolistic greed were made.

George E. Van Kennen, Special Deputy Attorney-General, who drafted the measure, said it would affect only the St. Lawrence and Niagara Rivers and was intended to prevent a private monopoly of electricity in New York State such as the coal monopoly in Pennsylvania. He said that the bill was drawn in the best interests of the people of the state and that it would protect them from the companies which were now charging "exorbitant rates" for electricity.

William Barclay Parsons of New York City contended that such a law would be the means of killing private enterprise and that the bill really defeated itself, because no provision was made whereby power could be sold to electric railways.

Claims made by supporters of the measure that government development of hydro-electricity in Canada had resulted in cheaper rates for consumers were disputed by Frederick D. Corey, president of the Niagara, Lockport & Ontario Power Company.

Former Mayor Burns of Troy, representing the New York State Conference of Mayors, asserted that the bill was the result of the arrogance of water-power interests. If it became law, it could be used as a weapon to compel them to provide cheaper rates and better treatment to the consumers. The State Federation of Labor went on record in favor of the bill.

Senator Rabenold urged the power interests to help the state work out a plan for the economical development and distribution of hydro-electricity.

### PUBLIC SERVICE COMMISSION BILL PASSES STATE SENATE

The bill to reorganize the New York Public Service Commission by substituting a commission of three members, removable by the Governor, for the present five commissioners, who can be removed only by a two-thirds vote of the Legislature, was passed by the New York State Senate on Wednesday and sent to the lower house. The Democrats control the Senate and the Republicans the Assembly.

## Revision of Standards

**A. I. E. E. Committee Making Good Progress—Twenty-seven Sections Under Tentative Preparation**

THE standards committee of the American Institute of Electrical Engineers has undertaken a thorough revision of the A. I. E. E. standards. The work of revision is being carried out on the basis of certain principles as follows:

1. The standards will be subdivided into separate sections, each adequate to the needs of the machinery with which it deals.

2. There will be sections relating to general principles, technic of measurements and so forth.

3. Whenever practicable, the same general order of arrangement of the contents will be followed in each of the sections. This order of arrangement is as follows: Scope, service conditions, definitions, rating, heating limits, other limits to rating, efficiency, dielectric strength and insulation, resistance, regulation, variations in voltage, speed and frequency, construction details, etc.

The committee is preparing twenty-seven sections with the following titles:

1. General Principles Upon Which Heating Limits Are Based.
2. Standard Definitions and Symbols.
3. Standards for the Measurement of Test Voltages in Dielectric Strength Tests.
4. Standards for Direct-Current Generators and Motors and Direct-Current Commutator Machines in General.
5. Standards for Alternating-Current Synchronous Generators and Motors and Synchronous Machines in General.
6. Standards for Synchronous Converters.
7. Standards for Induction Motors and Asynchronous Machines in General.
8. Standards for Alternating-Current and Direct-Current Fractional-Horsepower Motors.
9. Standards for Railway Motors.
10. Standards for Prime Movers and Generator Units.
11. Standards for Power and Distributing Transformers.
12. Standards for Induction Regulators.
13. Standards for Instrument Transformers.
14. Standards for Control Apparatus.
15. Standards for Oil Circuit Breakers.
16. Standards for Air Circuit Breakers, Lever Switches, Inclosed Lever Switches and Disconnecting Switches.
17. Standards for Busbar Supports, Ammeter Jacks, Potential Plugs, Test Plugs, Power Fuses and Potential Transformer Fuses.
18. Standards for Switchboard Panels.
19. Standards for Lightning Arresters.
20. Standards for Electric Railways.
21. Standards for Wires and Cables.
22. Standards for Transmission Lines and Distribution Lines.
23. Standards for Meters and Instruments.
24. Standards for Telegraphy and Telephony.
25. Standards for Radio Communication.
26. Standards for Storage Batteries.
27. Standards for Illumination.

This division and the titles are not necessarily final and may be subject to modifications. It is the intention of the committee to concentrate on a few sections which, when completed, will serve as models for the others. These are:

3. Standards for the Measurement of Test Voltages in Dielectric Strength Tests.
4. Standards for Direct-Current Generators and Motors.
6. Standards for Synchronous Converters.
8. Standards for Alternating-Current and Direct-Current Fractional-Horsepower Motors.
11. Standards for Power and Distributing Transformers.
14. Standards for Control Apparatus.

The work is being carried on informally and suggestions are welcome from all who are interested. Each section will be approved by a representative working committee before being approved by the standards committee.

It is proposed that before final adoption each section shall be printed or otherwise duplicated, and appropriate notice will appear in the *Journal of the A. I. E. E.* so that any one interested may obtain copies and contribute criticisms and suggestions.

### Preliminary Draft of Standards for Control Apparatus

It is expected that enough progress will have been made on the section of the proposed revision covering standards for control apparatus to permit its submission to the standards committee of the A. I. E. E. for approval at the meeting of the committee to be held about May 11. It is also expected that copies of the proposed standards will be available for distribution by April 16, and the standards committee requests that all interested engineers obtain copies by applying to the secretary of the Institute and give the committee the benefit of their criticisms and suggestions.

## For Standardization in the Electrical Industry

For some time past there has been a growing feeling in the electrical field that the several electrical associations engaged in standardization work should co-operate in presenting a single set of electrical standards to the American Engineering Standards Committee for approval as American standards. The lack of universally accepted American standards has been a considerable handicap to this country in connection with international standardization and has undoubtedly increased the difficulty of selling electrical products in foreign countries.

During the summer of 1922 a movement was started to revise the A. I. E. E. standards, subdividing them into a number of separate pamphlets or sections, each covering completely the standards for one kind of apparatus. An outline of this work is printed on this page.

These two movements—one to revise the A. I. E. E. standards and the other to arrive at a single set of American standards through co-operative effort—were joined in a resolution adopted by the A. I. E. E. standards committee and approved by the A. I. E. E. board of directors last year.

Thus far standards for certain electrical machinery and apparatus only have reached a stage where the co-operative effort can take tangible form, and to deal with these the National Electric Light Association, the Electric Power Club, the Associated Manufacturers of Electrical Supplies and the American Institute of Electrical Engineers have appointed such official representatives. This joint committee has begun work and has had under consideration a section of standards for control apparatus. The first section, which is now in the hands of a representative working committee, will, as stated in the preceding article, be ready for circulation to all those interested within a brief period of time.

## Electrical Men Welcome Sir J. J. Thomson

THE visit of Sir Joseph J. Thomson, master Trinity College, Cambridge, England, and a distinguished electro-physicist, has aroused great interest among the electrical men of America. The group picture shows a gathering at the works of the Metropolitan Engineering Company in Brooklyn, where Thomas E. Murray's method of welding glass to metal was inspected. Left to right, the men in the group are: J. B. Murray, vice-president Metropolitan Engineering Company; Thomas E. Murray, vice-president New York Edison Company; Sir J. J. Thomson; W. C. L. Eglin, vice-president Philadelphia Electric Company; Robert B. Owens, secretary Franklin Institute; John W. Lieb, vice-president New York Edison Company; John F. Murray, secretary Metropolitan Engineering Company; Thomas E. Murray, Jr., president Metropolitan Engineering Company, and Mr. Fields, a representative of the American Telephone & Telegraph Company.

## Pacific Coast Technical Committees Meet

A final assembly of the sub-committees of the Technical Section of the Pacific Coast Electrical Association was held at Fresno, Cal., on March 20-22. Plans for the annual convention of the association, to be held in San Francisco on June 19-22, were the principal topic of discussion. It was decided to present two or three short papers on correlated subjects at the convention instead of submitting a printed report of the year's activity as in the past.

The chief interest of the three-day session just held centered in questions concerning three-phase versus single-phase distribution, 4,000-volt distribution, radio communication and automatic generating plants, and on all four of these topics informative discussions were held.

The hydraulic power committee reported that it had made a study of penstocks during the past year and had published its findings in a comprehensive report which will be presented by the national committee at the New York convention in June.

It has been decided to continue the work of the safety rules committee and the inductive co-ordination committee.

A meeting of the overhead-systems committee was held coincident with the meeting of the national committee in Chicago. The meeting was devoted largely to a discussion of the size and scope of the new handbook to be compiled by the committee. A resolution was passed favoring the adoption of 8½-in. x 11-in. sheets with standard loose-leaf punching so that the sheets may be filed in a loose-leaf binder of whatever description suits the individual.

# Contractors Appoint a High Commissioner

### Charles L. Eidlitz Chosen to Be the Judge Landis of the Electrical Contractors of New York City—He Will Seek to Reform Their Business Methods

EVER since 1914 the electrical contracting business of New York City has been on an unstable basis. The war brought with it more work than could be comfortably handled by existing firms, and in consequence inexperienced and irresponsible wiremen were attracted to the business and began to compete for contracts, to the demoralization of the entire electrical trade.

Conditions became worse instead of better after the war. Competition was bitter and keen; overhead expense was ignored, and jobs were taken for less than the cost of material and labor, complete reliance for profit being placed on changes and extras. Such a condition of affairs meant that the contractors were losing not only money but good will as well. Matters were finally brought to a head at a recent meeting of the electrical contractors' associations of Manhattan, Brooklyn and Queens Boroughs, when the following resolution was adopted:

"Whereas the business of electrical contracting has developed a speculative character to such an extent as to convert it from a profitable to an unprofitable business, partly owing to economic conditions and partly to the increase of the speculative hazards normally inherent in the business; and

"Whereas it is desirable to take such remedial measures as may suggest themselves by a careful survey of the situation,

"Therefore, be it resolved that Charles L. Eidlitz be and he hereby is appointed a commissioner of this association to make such studies in whatever manner deemed best by him in consultation with the executive committee and to develop therefrom for this association ways and means of transforming the business of electrical contracting from its present highly speculative character to a regular and profitable business, free from undue speculation."

CHARLES L. EIDLITZ

The aggregate business done by the electrical contractors in the metropolitan district ranges from $40,000,000 to $60,000,000 yearly. There are three hundred members in the associations. Mr. Eidlitz began his work of reorganizing contracting methods and eradicating bad trade practices among them on April 1. The first organization meeting was held in New York on Thursday.

#### EIDLITZ A CONTRACTOR AND ORGANIZER

The contractors of New York were moved to choose Mr. Eidlitz as their commissioner because of his long experience and standing in the industry. Mr. Eidlitz was born in New York on Sept. 3, 1866. As a boy he was one of the numerous youthful apprentices in the Edison Machine Works on Goerck Street, New York City. About two years after graduation from Columbia University in the class of 1888 Mr. Eidlitz organized the Charles L. Eidlitz Company, electrical contractors. The firm's affairs progressed successfully for more than twenty years, or until Mr. Eidlitz retired as president in 1913, bringing its operations to a close.

Though nominally in retirement, Mr. Eidlitz is a very busy man. He is president of the Metropolitan Electric Manufacturing Company, which he organized in 1902; president of the Atlantic Electric Goods Company and is interested less directly in several other enterprises. His influence has been strongly felt in the councils of his associates and of the electrical contracting profession at large, to which he has brought marked organizing and executive ability. He was one of the founders of the National Electrical Contractors' Association, serving as its first president from 1901 to 1903. He also established the Building Trades Employers' Association of New York City in 1903, of which he was president until 1905. Mr. Eidlitz is a member of the New York Electrical Society and the Building Trades Club and a founder member of the Edison Pioneers.

#### OBJECTS TO BE ACCOMPLISHED

When Mr. Eidlitz was seen in his office at 1170 Broadway by a representative of the ELECTRICAL WORLD this week, he told of the conditions in the electrical contracting business in New York City and its environs, the chaotic state of which caused him to be chosen to his new office. Mr. Eidlitz said that the job was not of his seeking, but because of his long connection with the electrical contracting business and his keen interest in its welfare he had accepted the position thrust upon him. The movement, he said, was instigated by the largest contracting firms in the business, all of which have pledged him their earnest co-operation and support.

Mr. Eidlitz will have authority to reorganize local contracting methods from top to bottom but without touching labor. The books and accounts of the various contracting firms will be open to him at all reasonable times. He is privileged to inspect them much as a bank examiner inspects the books of national and state banks. As indicative of the dearth of knowledge among even large firms on the cost of doing business, Mr. Eidlitz showed a tabulation of bids for a large building in the city. Although the specifications furnished bidders were the same, the estimates for labor alone ran $8,100, $11,000, $12,000, $13,500, $14,600, $16,800, $17,000 and $20,000, and the estimates for the conduit and other material were also at variance to almost the same degree. Mr. Eidlitz said this case was typical of bids for other installations and that it showed the necessity for education. To his amazement he had found that the painstaking work of the Association of Electragists International in its "Manual of Estimating" was either unknown or ignored in spite of the fact that it represented

the practice and experience of companies all through the country and was applicable to work anywhere, the unit basis being man-hours.

"The electrical contracting business in New York," he said, "has become completely demoralized. Some men are in it without real knowledge of the work, business training or financial responsibility. No real organization or reputation can stand up against competition of this kind. I have seen bids which when the cost of labor plus the cost of material was deducted would not even pay expenses, to say nothing of profit. So many changes and additions are made in electrical equipment during the course of constructing a building that contractors are tempted to put in figures for the original work at less than cost in the hope that the extra work will enable them to pull out with a profit. This makes a gambling game out of a legitimate business. There is no apparent reason why bids should vary from 20 to 140 per cent. Certainly the cost of labor should not vary on efficiency or supervision more than 10 per cent. If when bidding on contracts electrical contractors were informed that the contract carried with it no changes or extras, all such work being let to some other contractor, the bids would be entirely different.

"What I hope to do," Mr. Eidlitz went on, "is to educate the trade to a knowledge of how much of a certain kind of work a man can do. In this work I shall seek the active co-operation of the Association of Electragists International as well as the experience of the non-association contractors. Out of this work should evolve a manual for the electrical wireman which will be of immense value to him in his work and will educate him in proper business methods. The task which is before me has nothing whatsoever to do with price fixing, nor will it savor in the least of collusion. Whenever I am in doubt as to whether it is legal for me to go ahead on a certain line, I will ask the Attorney-General for a ruling."

Mr. Eidlitz's appointment and acceptance of the post of commissioner has been received very favorably by the electrical contractors of the city.

# Substantial Increase in Utility Financing During March

During the month of March issues of stocks and bonds made by electric light and power companies totaled **$95,172,750**, the highest figure reached this year, exceeding the banner month of 1922 (October) by more than three million dollars. Only one offering exceeded **ten** million dollars, the fifteen-million-dollar-issue of the Duquesne Light Company, but thirty-two utilities took part in the month's financing. Although the refunding activity continued, a large number of issues were offered for the purpose of obtaining new capital to provide for additions and extensions. The rate of return yielded the investor advanced to 6.31 from 6.25 in February. Long-term issues prevailed.

SECURITY ISSUES OF ELECTRIC SERVICE COMPANIES IN MARCH

| Name of Company | Amount of Issue | Period, Years | Class | Purpose | Interest Rate | Price | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| Consolidated Power & Light Co., (W. Va.) | $7,000,000 | 20 | First mortgage and refunding lien sinking-fund gold bonds, series A | General corporate purposes | 6½ | 99½ | 6.50 |
| Southern California Edison Co. | 10,000,000 | 21 | General and refunding mortgage gold bonds | Construction | 5½ | 97½ | 5.70 |
| Pennsylvania Water & Power Co. | 450,000 | 17 | First mortgage sinking-fund bonds | Additions | 5 | 98½ | 5.12 |
| Portland Railway, Light & Power Co | 1,000,000 | .. | Cumulative prior preferred stock, series A | To reimburse for construction | 7 | 98 | 7.13 |
| Puget Sound Power & Light Co. | 2,000,000 | .. | Cumulative prior preference stock | Additions | 7 | 103 | 6.80 |
| Wisconsin Railway, Light & Power Co. | 825,000 | 10 | First mortgage and refunding gold bonds of 1913 | | 5 | 89 | 6.50 |
| American Power & Light Co. | 5,000,000 | 93 | Gold debenture bonds, American series | To retire floating debt and for working capital | 6 | 95½ | 6.25 |
| Duquesne Light Co. | 15,000,000 | .. | First preferred stock, cumulative, series A | Refunding and for additions and extensions | 7 | 103 | 6.80 |
| Missouri Utilities Co. | 600,000 | 29 | First mortgage gold bonds, series A | Refunding and to reimburse for construction | 6 | 96½ | 6.25 |
| Penn Public Service Corp. | 1,500,000 | 15 | Convertible gold debentures | Acquisition of common stock of companies to be merged and for working capital | 6½ | 98 | 6.70 |
| Public Service Co. of Northern Ill. | 5,000,000 | 39 | First lien and refunding mortgage gold bonds, series A | Capital expenditures and to reimburse for retirement of maturing obligations and expenditures | 5½ | 94½ | 5.88 |
| Federal Light & Traction Co. | 2,500,000 | 30 | Convertible debenture gold bonds, series A | Refunding and to reimburse for expenditures | 7 | 100 | 7 |
| Georgia Railway & Power Co. | 3,000,000 | 25 | General mortgage gold bonds, series F | | 6 | 97 | 6.25 |
| West Penn Power Co. | 6,000,000 | 40 | First mortgage gold bonds, series E | Additions and extensions | 5 | 90 | 5.62 |
| Hawkesbury Electric Light & Power Co., Ltd. (Ont.) | 300,000 | 20 | First mortgage bonds | Refunding and for additional working capital | 6½ | 100 | 6.50 |
| Interstate Electric Corp. | 550,000 | 10 | Sinking-fund gold debenture bonds | Refunding, additions and other purposes | 7 | 98½ | 7.20 |
| Los Angeles Gas & Electric Corp. | 4,000,000 | 20 | General and refunding mortgage gold bonds, series F | Additions and extensions | 5½ | 97¾ | 5.70 |
| Metropolitan Edison Co. | 1,000,000 | 30 | First and refunding mortgage gold bonds, series C | To reimburse for capital expenditures | 5 | 89 | 5.77 |
| | 1,176,000 | .. | Cumulative participating preferred stock | Acquisition of new stock and other purposes | 7 | 98 | 7.14 |
| Ohio Public Service Co. | 2,675,000 | 30 | First mortgage and refunding gold bonds, series C | Additions, refunding and other purposes | 6 | 97.29 | 6.20 |
| United Light & Railways | 1,000,000 | 30 | First lien and consolidated mortgage gold bonds, series A | To reimburse for additions and improvements | 6 | 97 | 6.20 |
| Arizona Power Co. | 800,000 | 24 | First lien and unifying mortgage gold bonds, series A | Refunding, to reimburse for additions and other purposes | 6 | 97 | 6.20 |
| General Gas & Electric Corp. | 1,000,000 | | Cumulative preferred stock, class A | Additions and for other purposes | 8 | 100 | 8 |
| Illinois Electric Power Co. | 3,500,000 | 20 | First mortgage sinking-fund gold bonds, series A | Construction | 6 | 97 | 6.25 |
| Electrical Securities Corp. (N. Y.) | 1,000,000 | 30 | Collateral trust sinking-fund gold bonds, sixteenth series | New capital | 5 | 94 | 5.40 |
| Salina Light, Power & Gas Co. | 950,000 | 20 | First mortgage sinking-fund gold bonds, series A | Refunding and for additions and extensions | 6 | 96.63 | 6.30 |
| Wisconsin-Minnesota Light & Power Co. | 323,750 | .. | Cumulative preferred stock | Additions and extensions | 7 | 92½ | 7.57 |
| American Water Works & Electric Co. | 2,000,000 | .. | Cumulative first preferred stock (voting-trust certificates) | Corporate purposes | 7 | 91 (flat) | 7.75 |
| Eastern Connecticut Power Co. | 3,000,000 | 25 | First mortgage sinking-fund gold bonds, series A | Extensions, purchase of securities and refunding | 5 | 91 | 5.70 |
| | | | | To provide for future requirements | 5 | 89½ | 5.80 |
| Idaho Power Co. | 3,200,000 | 24 | First mortgage gold bonds of 1917 | Refunding | 6 | 96 | 6.30 |
| Nevada-California Electric Corp. | 1,500,000 | 27 | First lien gold bonds, series B of 1920 | Refunding and for cash working capital | 6½ | 98 | 6.75 |
| Standard Gas & Electric Co. | 6,000,000 | 10 | Convertible gold debenture bonds | Refunding and to reimburse for capital expenditures | | | |
| Western United Gas & Electric Co. | 1,323,000 | 27 | General mortgage gold bonds | | 6 | 100 | 6 |
| Total | $95,172,750 | | | | | | |

## A. E. S. C. Year Book Out

**Steady Progress Toward Standardization in Electrical Industries Is Indicated**

GREAT progress the last year in standardization projects affecting electrical industries is shown by the 1923 Year Book of the American Engineering Standards Committee, which has just been issued. Of thirty-five standards thus far approved by the committee, eleven are of special interest to the electrical industries. Of these the National Electrical Code and Electrical Safety Code of course rank first, the others being the "Code for Electricity Meters," "Automobile Headlighting Specifications," "Code of Lighting Factories, Mills and Other Workplaces," "Safety Code for the Protection of the Heads and Eyes of Industrial Workers," "Illuminating Engineering Nomenclature and Photometric Standards," "Methods for Battery Assay of Copper," "Specifications for Electrolytic Copper Wire Bars, Cakes, Slabs, Billets, Ingots and Ingot Bars," "Specifications for Lake Copper Wire Bars, Cakes, Slabs, Billets, Ingots and Ingot Bars," and "Specifications for Soft or Annealed Copper Wire."

Of 121 projects which have reached an official status, fifteen have to do with electrical engineering. Two hundred and seventy-five national bodies—technical, industrial and governmental—are now co-operating in the work of the A. E. S. C. through officially accredited representatives, and more than nine hundred individuals are serving on the sectional committees which carry on the actual standardization work, the A. E. S. C. acting only as an administrative body.

### Electrical Representatives

The electrical industry is represented on the committee by the American Institute of Electrical Engineers, the Association of Edison Illuminating Companies, the National Electric Light Association, the American Electric Railway Association, the Electrical Manufacturers' Council, the Associated Manufacturers of Electrical Supplies, the Electrical Manufacturers' Club and the Electric Power Club.

One of the most important accomplishments of the year was the development of a plan of co-operation between the Federal Specifications Board—the body which develops the specifications for all government purchases—and the A. E. S. C. by which the specifications of the board are submitted informally to the A. E. S. C. before definite adoption. Through this plan the government receives the criticisms of industry through the organizations which speak for those branches of industry that are concerned with any particular standard. Among the specifications which have already been submitted to the A. E. S. C. under this new co-operative arrangement are those for dry cells, snap switches, rigid conduits and rubber-insulated wires and cables. Dr. A. S. McAllister, who has been serving as a special liaison officer of the Bureau of Standards, has been designated by the chairman of the Federal Specifications Board as liaison representative in the co-operative work with the A. E. S. C.

Other electrical projects which have an official status before the committee are those for an electrical fire and safety code, a safety code for electrical power control, a safety code for lightning protection, terminal markings for electrical apparatus, rating of electrical machinery, insulated wires and cables (other than telephone and telegraph), symbols for electrical equipment of buildings and ships, electrical properties of aluminum, electrical installations on shipboard, a specification for 600-volt direct-current overhead-trolley construction, and electrical safety rules for bituminous coal mines.

## Rural Power Districts Authorized in Michigan Bill

A bill now before the Michigan Legislature will, if passed, allow any township having a resident population of not less than 500 to establish rural power districts and by purchase or construction acquire facilities to transform, transmit and distribute electrical energy. Before such a district is established the township board must declare the expediency of the formation of such a district and obtain an estimate on the cost from some competent person, and the question of raising the necessary money shall be submitted to the electors at a regular or special election. It will take two-thirds of the electors voting at the election to pass the proposal. The township will then be authorized to borrow not to exceed 5 per cent of the assessed value of the property in the township for the purpose of establishing the power district. Bonds may be issued but shall not be sold below par, the interest shall not exceed 6 per cent, and the total amount expended must not exceed the estimate.

Authorization for maintenance is given to the board, which will have the right to contract with any public or private corporation for its energy supply. Construction of lines is to be in accord with the specifications prescribed by the Michigan Public Utilities Commission.

## Delaware River Development Bill a Law in New York

The bill providing for the appointment by the Governor of New York of three commissioners to confer with commissioners named in New Jersey and Pennsylvania for the purpose of making a treaty between the three states and the federal government for the conservation, use and development of the water resources of the Delaware River is now a law in New York State. The sum of $10,000 is to be appropriated to pay the necessary expenses of the commissioners, who are to serve without compensation.

## Rate Cut for Philadelphia

**Consumers Will Save a Million a Year by Reductions in Residential and Other Charges**

THE rate reduction made by the Philadelphia Electric Company a year ago, which the officials of the company say resulted in a saving to consumers of $1,200,000 in twelve months, has just been followed by another reduction which the officials say will bring a further saving to consumers in a similar period of $1,000,000.

The new rates will go into effect on May 1. Residence service will be charged for at the rate of 8 cents a kilowatt-hour for the first 36 kw.-hr. or less used during a three-month period, 7 cents for the next 144 kw.-hr. or less (a reduction from 225 kw.-hr.), and 5 cents for energy in excess of 180 kw.-hr. (a reduction from 261 kw.-hr.). Retail lighting service will be on an 8-cent, 6-cent and 4-cent basis as before, but the number of hours' use in the three classes will be reduced respectively from 75 to 60, from 75 to 60, and from 150 to 120. For retail power service the same reductions in hours' use will be made, the rates remaining at 7½ cents, 5½ cents and 3½ cents. There will also be reductions in "standby" and "current" charges for wholesale light and power service (maximum demand) and "Rate E" power service, as well as kilowatt-hour reductions for auto-charging and for theater service.

Reductions in municipal lighting rates throughout the territory served by the company will bring about an annual saving of more than $80,000.

### Company Explains Reductions

W. H. Johnson, senior vice-president of the Philadelphia Electric Company, discussed the reductions as follows:

"The reduction in rates, expressed on a percentage basis, will vary in the different schedules from 2½ to 5 per cent, depending upon the class of service, and will amount, over all, to nearly $1,000,000. Customers who are obtaining service under schedules of our tariff in which a coal clause is incorporated will also receive the benefit of whatever lower coal costs we may obtain.

"When the reduction was made a year ago it was our expectation that business generally would take an upward turn and that the reduction in rates made by us at that time would act as a stimulus to such business expansion, which would be reflected in increase in our revenue. It is most gratifying to the management to have our predictions verified. It is pleasing that we are able this year to make a reduction in rates for street lighting to the cities and boroughs in our territory, even though our contracts with them at higher rates are valid for from one to five years. The reductions in rates during the last two years have only been made possible because of largely increased output in connection with increased efficiencies and the exercise of rigid economies in our operation."

## Massachusetts Adopts Industrial Lighting Code

Effective Jan. 1, 1924, the Massachusetts Department of Labor and Industries has voted to establish a lighting code for industrial and mercantile establishments following the general lines of the New York code. As an initial set of regulations the code appears to be potentially effective in relation to flagrant abuses of illumination and furnishes a point of departure for later advances. Well-informed opinion, however, inclines to the view that the code leaves much to be desired in relation to the specification of intensities for textile mills and for machinery devoted to coarse operations. The code does not follow that of the American Engineering Standards Committee.

## Indianapolis Contest Over Competition Comes Up

The Merchants' Heat & Light Company's injunction suit to restrain the Indiana Public Service Commission from issuing a certificate of necessity and convenience to the Terre Haute, Indianapolis & Eastern Traction Company was assailed March 28 in a demurrer filed by the commission. The commission recently demurred to a similar suit filed by the Indianapolis Light & Heat Company. A joint hearing on April 9 in the Superior Court has been ordered. Officials predict that the hearing on the demurrers will result in the cases being quashed. In answer to the charge that the local commercial electric field is congested, the demurrer declares that the Merchants' company is not operating under an exclusive franchise and is powerless to exclude competition. It further contends that the company's complaint fails to show that the Public Service Commission's order to the traction company is for rate-making purposes.

City officials of Richmond, Ind., have voiced disapproval of a contract submitted by the Terre Haute, Indianapolis & Eastern Traction Company asking for permission to run a high-power transmission line through the city to connect with the Dayton Light & Power Company east of Richmond. The company agrees not to compete with the municipal light plant in Richmond, but has refused, it is said by city officials there, to agree not to compete with the city light plant outside the corporation limits. Some of the big industrial consumers are outside the city limits, and the city officials fear the traction company will try to get this patronage if permitted to run its wires through the city.

## Missouri Commission Gets Large Appropriation

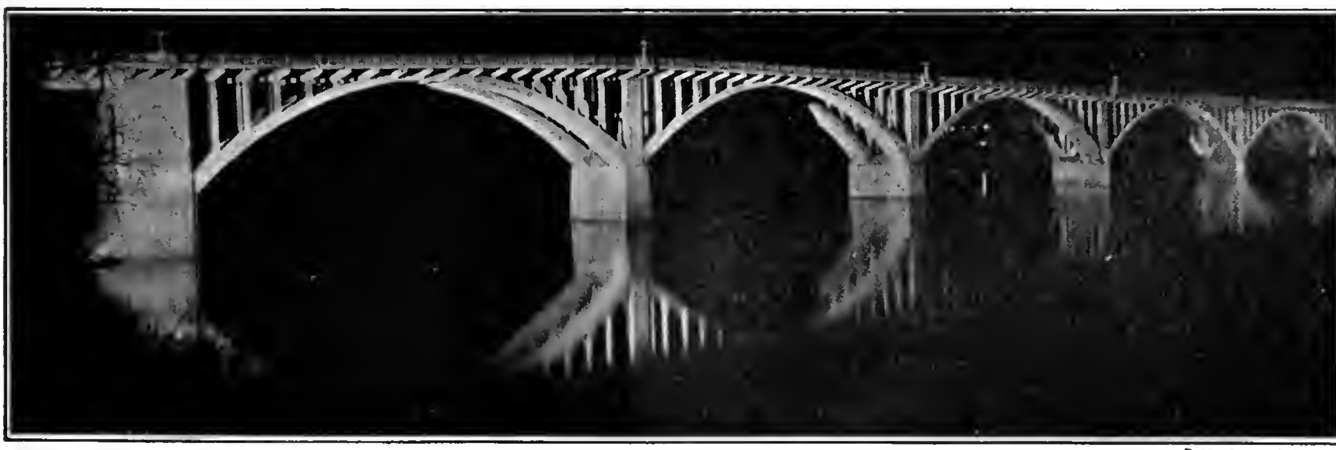
The Missouri State Public Service Commission, which was the center of an eighteen-hour deadlock in the closing hours of the Legislature, came out of the fight with a larger appropriation than it had asked for and with more than it received for the last biennium. As finally passed this bill carried an appropriation from the revenue fund for the Public Service Commission of $125,000 and a like sum from the earnings of the commission if they run so high. This $250,000 with the $71,000 for the commission incorporated in the civil salaries bill gives the commission $321,000, though it had asked only for $318,000.

## Illinois Power & Light Bond Issue of $30,000,000

Plans already reported (Electrical World, March 10, page 591) for the consolidation and reorganization of the North American Light & Power Company and the Illinois Traction Company, whose combined interests include about ninety-five public utilities valued at $200,000,000, were approved at a meeting of the stockholders of the Illinois Traction Company on March 24th. A new company, to be called the Illinois Power & Light Corporation, was formed to absorb the light and power companies owned by the North American Light & Power Company, which served about forty towns in southern Illinois, as well as those owned by the Illinois Traction Company, which served about fifty-five towns in Illinois, Missouri, Kansas and Iowa. W. B. McKinley will be head of the merged corporations.

An issue of $30,000,000 first and refunding mortgage thirty-year 6 per cent bonds of the new company was offered on Monday at 98½, to yield 6.10 per cent. Proceeds from the sale and also from the sale of $10,000,000 of debenture bonds will be used toward the retirement of more than $50,000,000 securities of the companies formerly constituting the Illinois Traction Company system and also to acquire the properties formerly owned by the Southern Illinois Light & Power Company.

## Floodlighting Little Rock's New Broadway Bridge



©Charles J. Griffith

The floodlighting of the Broadway Bridge at Little Rock, Ark., thrown open on March 12, was the result of co-operation between the various branches of the electrical industry in Little Rock. The chairman of the Board of Commerce committee appointed a committee from the utilities of the city, which in turn invited the Electric Club, composed of the electrical contractors in the city as well as the utilities, to assist. The very effective result of the co-operation of these bodies is shown in the photo.

The length of the bridge, including approaches, is 2,873 ft. The floodlighting was financed by the utility companies of Little Rock and designed by the Little Rock Electric Club. Four batteries of floodlamps were used to illuminate the bridge during the celebration and four individual floodlamp units were spaced apart from the batteries. Each battery consisted of two 1,000-cp. and three 500-cp. floodlighting units. These batteries were placed about 100 ft. from the bridge on both sides of the river and on each side of the bridge. In order to bring out the center span, an additional floodlamp was installed about 250 ft. from the bridge on each side and on both sides of the river.

# Brief News Notes

**Wausau to Have Electrical Exposition.**—Wausau, Wis., is to have an Electrical Exposition and Food Products Show on April 9-14 which its promoters claim will be one of the best ever held in a city of 20,000 people. Electrical interests operating in all parts of Wisconsin are to be represented.

**Marshall, Okla., to Abandon Municipal Plant.**—When the new transmission line of the Oklahoma Gas & Electric Company is completed the town of Marshall, Okla., will abandon its municipal electric light plant and receive service through the Enid division of that company.

**Jim Falls Power Plant Completed.**—The Chippewa Power Company announces the completion of the hydro-electric plant at Jim Falls, Wis., started last summer. It has a capacity of approximately 16,000 hp. and has been leased to the Wisconsin-Minnesota Light & Power Company, with whose Wissota hydro-electric plant near Eau Claire it is connected.

**Another College in Line for a Metermen's Course.**—The Kansas State Agricultural College will hold a metermen's short course from April 16 to April 21. Metermen of Kansas and surrounding states are being invited, and many of the larger cities with well-developed meter departments and expert metermen in charge will co-operate by sending their men to assist.

**Electrical Progress at Memphis.**—It will cost the Memphis Power & Light Company more than $3,000,000 to complete its new plant at Broadway, Fourth and Iowa Streets, President H. C. Abell announces. The amount will include the installing of boilers, turbines and other electrical apparatus. Construction is under way, and the company hopes to have the plant ready for operation by next fall.

**Express Company Uses 1,500 Electric Trucks in Twenty-Seven Cities.**—Twenty-five electric trucks for use in San Antonio, Tex., have been ordered by the American Railway Express Company, and all horse-drawn trucks will be discontinued. San Antonio is the twenty-seventh city in the country in which electric trucks of the American Railway Express Company are being used, bringing the total in use by this company to approximately 1,500.

**Fishing for Sardines with Electricity.**—Sardine canneries along the Norwegian coast, recently threatened with a complete lack of raw material owing to the fish remaining so deep as to render fishing impossible, have, it is said, solved the problem of bringing them to the surface by flashing electric searchlights over the water. According to a report received by the Department of Commerce from Consul George N. Ifft, Bergen, many shoals of the little fish previously safe from capture are being lured to the surface and into the cans.

**Geary Goes on Oklahoma Gas & Electric's Lines.**—The town of Geary, Okla., was cut in on the Oklahoma Gas & Electric Company's transmission line a week or two ago and the local municipal electric light and power plant was shut down, the seventh to close within recent months. The Geary line runs south from Watonga, 15 miles, and will be operated as a part of the Enid division.

**Interconnection in North Central States.**—Interconnection between the 40,000-volt lines of the Otter Tail Power Company, Fergus Falls, Minn., and the Union Light, Heat & Power Company, Fargo, N. D., has been completed and interchange of energy begun. This leaves a gap of only 12 miles between the generating stations on the Mississippi River in Minnesota and the largest city of North Dakota.

**Meter School at Purdue.**—The electric metermen of Indiana will meet at Purdue University for a five-day conference and school on April 9 to 13, under the auspices of the engineering extension service. A room has been set aside in the electrical engineering building where apparatus will be placed and cataloged so that the particular machine sought may be found at once. Experiments will be conducted on polyphase meter connections and the determination of instrument transmission errors.

**Michigan Utility Increases Capacity.**—By the addition of a 2,000-kw. General Electric turbo-generator and a 780-hp. Stirling boiler the capacity of the Citizens' Light & Power Company, Adrian, Mich., has been increased to 3,500 kw. This increased capacity was due, according to H. A. Fee, president, to the growing demand for both residential and industrial power. In 1919 the total kilowatt-hour sales were 2,298,913, while in 1922 they had risen to 3,001,389, with a value of $180,905.

**Utility Education in Missouri High Schools.**—Four thousand pupils in 228 of the 636 high schools in Missouri are studying public utility subjects. This has come about through the activities of the Missouri Committee on Public Utility Information, which, in noting the success of the work, suggests that since the bulletins supplied the schools deal largely with technical subjects, it would be wise for central-station operators to invite classes to visit their plants for personally conducted tours.

**Map of Iowa's High-Tension Lines.**—A map is being prepared by the Iowa Committee on Public Utility Information which will show the network of transmission lines now covering the state. Besides the high-tension transmission lines connecting the smaller towns, thousands of miles of lower-voltage rural lines will also be shown. Reports received by the committee indicate that a great number of rural lines will be built in Iowa this year. Ten years ago such a map would have shown only a few short scattering lines.

**Middle West Utilities Increases Stock.**—At the annual stockholders' meeting in Wilmington, Del., on March 27, both the prior-lien and the preferred stock of the Middle West Utilities Company were by charter amendment increased to $30,000,000 and the common stock to 300,000 shares of no par value.

**Electric Vehicles for Post Office Service.**—In the report of the joint congressional commission on postal service the enormous cost of repairs to motor vehicles is dwelt upon and doubt is cast on the economy of the government's maintaining its own equipment. The contract system, the commission asserts, should be tried out in representative cities. It adds: "It is, further, the opinion of the commission that electric vehicles should be experimented with in a typical city or group of cities to determine if economy would not be secured by their adoption in preference to the gas-propelled machine."

**Leviathan to Have Biggest Radio.**—The radio installation aboard the Leviathan, which will re-enter the transatlantic service in June flying the United States Lines flag, will, it is said by the Radio Corporation of America, which is making the installation, be the most powerful and elaborate steamship radio equipment in the world. In addition to telegraph service, a radio-telephone installation which will provide voice contact with other vessels and shore stations is to be installed. A special emergency set will also be put in. Furthermore, two of the lifeboats are to be fitted with emergency radio apparatus. The principal transmitter consists of a high-power vacuum-tube outfit which will deliver to main antonnas about six times as much power as the apparatus now used on the average steamship.

**Electrical Control of Sperry Gyroscope.**—A 350-hp. electric motor will drive the steel top weighing 100 tons and 13 ft. in diameter which Elmer A. Sperry has designed for the steamer Hawkeye State to prevent rolling and the consequent discomfort of the passengers. This gigantic top will run at 800 revolutions a minute in a huge metal case set in the hold of the vessel and so built that both case and top can incline to meet the motion of the ship. The top is electrically connected with a small gyroscope, which responds to the least roll and communicates its motion or swing to the 100-ton top. Answering the motion communicated electrically from the small gyroscope, the top swings first one way and then the other, and thus stops the roll of the vessel before it is well started, by acting as a counterbalance to the successive waves.

**Northern States Power Reduces Coal 15 per Cent.**—Improved operating economy at the fifteen steam-power plants of the Northern States Power Company in 1922 reduced the coal consumption per kilowatt-hour 15 per cent as compared with that consumed in 1921. This saving of 67,000 tons, valued at $400-000, was directly reflected in the earnings of the company. Steam-power

plants for the year generated 293,737,000 kw.-hr., or 35 per cent more than in 1921. The ten water-power plants totaled 139,878,000 kw.-hr., making a grand total of 433,615,000 kw.-hr. generated by the company's power plants. In addition, 54,330,000 kw.-hr. was purchased from other companies, making a total of 487,945,000 kw.-hr. placed at the disposal of the public in Minneapolis, St. Paul and nearly four hundred other cities, towns and villages in the Northwest in 1922.

**Yale Scholarship for Mexican Engineering Students.**—A Mexican scholarship in engineering at Yale has been endowed by John Hays Hammond. The award, which is for four years, will go to the student making the highest grade at examinations in Mexico City.

**North American Company Buys Light & Development Company.**—The North American Company has purchased the Light & Development Company of St. Louis. The North American Company owns the Union Electric Light & Power Company, and the Light & Development Company was a holding company operating several public utilities in and adjacent to St. Louis as well as numerous utilities in more distant points. This purchase foreshadows the probable amalgamation with the lines of the Union Electric Light & Power Company of properties in and around St. Louis which include the Cupples Station Light, Heat & Power Company in that city, the Western Power & Light Company in St. Louis County, an electric company in St. Charles, Mo., and one in Bonne Terre, Mo. The Light & Development Company owned and operated at points some distance from St. Louis the electric companies in Monmouth, Ill., Cape Girardeau, Poplar Bluffs and Carthage, Mo., and at points in other states.

**Large Self-Cooled Transformers Ordered by Northern States Power Company.**—In order to take care of increasing demand for power from industrial concerns and lighting requirements in and around Minneapolis, the Northern States Power Company has ordered from the Westinghouse Electric & Manufacturing Company three 15,000-kva. oil-immersed, self-colled single-phase transformers which, it is announced, are 50 per cent larger than the largest transformers of this type previously built. The three units used together in a bank will have a continuous capacity of 56,250 kva., or 75,000 hp. Each transformer will weigh approximately 150,000 lb., and the height to the tips of the high-voltage terminals will be nearly 25 ft. Approximately 7,000 gal. of highly refined oil is required for each unit. The high-tension winding of these transformers will be connected in star for 118,800 volts, the neutral of this star connection being solidly grounded, and the low-tension winding will be connected in delta for 15,405 volts. Inasmuch as the transformers are rated at 15,000 kva. with a temperature rise not to exceed 40 deg., they are equivalent to 18,750-kva., 55 deg.-rise transformers.

# Associations and Societies

**New York Section, A. I. E. E.**—At the New York Section meeting next Wednesday, April 11, Dr. Robert A. Millikan of the California Institute of Technology, Pasadena, will speak on "Some of the Developments of Modern Physics."

**Associated Engineering Societies Visit Wagner Plant.**—On March 28 the Associated Engineering Societies of St. Louis were entertained by the Wagner Electric Corporation. A buffet supper was served and a motion picture showing the details of the design and construction of Wagner motors and transformers was taken. More than 400 engineers participated.

**Society for the Promotion of Engineering Education.**—The annual meeting of this society will be held at Ithaca, N. Y., on June 20, 21 and 22. Today (Saturday, April 7) the New England branch of the society is holding, in conjunction with the Associated Industries of Massachusetts, a meeting at Wentworth Institute, Boston, at which Prof. D. C. Jackson, Prof. C. F. Scott, Dr. Charles W. Eliot and other well-known men are to speak.

**Innovation in Time of Section Meetings.**—The New York Section, Illuminating Engineering Society, will try out the plan of holding meetings at 5:30 p.m. instead of later in the evening. This innovation will begin on Thursday, April 19, when "Hospital Lighting" will be the topic. A buffet luncheon will be served, and the idea is to "tie in" the meeting with the business day, permitting members and guests to be free by 8 o'clock. The new plan is reported to have been adopted in England with much success.

**Middle Western Division, N. E. L. A.**—The first annual convention of the Middle West Geographic Division of the National Electric Light Association, to be held at the Statler Hotel, St. Louis, next Wednesday and Thursday, will on the first day listen to addresses on public utility finances by Festus J. Wade, president of the Mercantile Trust Company of St. Louis, and on customer ownership of public utilities and securities by Louis H. Egan, president of the Union Electric Light & Power Company, and Dwight N. Lewis, president of the National Association of Railway and Utilities Commissioners. On Thursday E. W. Lloyd, chairman of the Joint Committee on Business Development, will talk on better business development; Martin J. Insull, vice-president Middle West Utilities Company, on public relations, and J. C. Martin, Western editor ELECTRICAL WORLD, on rural-line development. There will be a conference of public utility information directors on Tuesday. Among others who will address the convention are H. E. Weeks, treasurer People's Light Company, Davenport, Iowa, and H. C. Blackwell, vice-president and general manager Kansas City Power & Light Company. President Smith, Vice-president Davidson and Executive Manager Aylesworth of the National Electric Light Association will address the delegates at the banquet to be given at the Statler Hotel Wednesday evening.

**Section Meetings, A. I. and S. E. E.**—Coming section meetings of the Association of Iron and Steel Electrical Engineers are announced as follows: Chicago, April 11, "Electric Heating of Sheet-Mill Rolls," by Gordon Fox; Philadelphia, April 20, inspection of Bethlehem Steel Company's Lehigh and Saucon plants; Cleveland, April 9, "Teletype Communication in the Steel Mill," by J. O. Carr; Birmingham, April 21, "Interconnection of Industrial Power Plants with a Central System," by G. H. Finks; Pittsburgh, April 12, "Transient Phenomena and Their Elimination," by C. P. Steinmetz, and April 28, "Factors in the Selection of Mine-Hoist Motors," by F. W. Cramer and A. A. MacDonald.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Middle West Division, N. E. L. A.—St. Louis, April 11-12 H. M. Davis, Bankers' Life Bldg., Lincoln.

American Society of Mechanical Engineers—Pacific Coast meeting, Los Angeles, April 16-18; general convention, Montreal, May 28-31. C. W. Rice, 29 West 39th St., New York.

Tri-State Water and Light Association—Birmingham, April 17-20. W. F. Steiglitz, Columbia, S. C.

American Physical Society—Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

American Institute of Electrical Engineers—Spring convention, Pittsburgh, April 24-26; annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Sept. 25-28. F. L. Hutchinson, 33 West 39th St., New York.

American Welding Society — New York, April 24-27.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Willis, 403 Slaughter Bldg., Dallas, Tex,

Electrical Supply Jobbers' Association—Executive committee and general meeting, Hot Springs, Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

Missouri Association of Public Utilities—River boat from St. Louis to Peoria, May 24-26.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

California State Association of Electrical Contractors and Dealers—Dorner Lake, Cal., June 9-16.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

North Central Division, N. E. L. A.—Minneapolis, June 13-15. H. E. Young, Minneapolis General Electric Company.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

Society for the Promotion of Engineering Education—Ithaca, N. Y., June 20-22. Dean F. L. Bishop, University of Pittsburgh.

Canadian Electrical Association — Montreal, June 20-23. Louis Kon, 65 McGill College Ave., Montreal.

American Society for Testing Materials—Atlantic City, June 25-29.

National Council Lighting Fixture Manufacturers—Hot Springs, Va., June 26-28.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13. D. L. Gaskill, Greenville.

## Commission Rulings

**Improper Capitalization.**—In rate proceedings concerning the Sault Ste. Marie Gas & Electric Company the Michigan Public Utilities Commission refused to permit the issue of stock to capitalize a deficit resulting from the failure to earn a 7 per cent return on the rate base, or to capitalize reorganization expenses incurred several years before the application was made and prior to commission regulation, or to capitalize the expenses of a rate proceeding.

**Evaluating Plant to Be Acquired by Municipality.**—In placing a value on the McGowan Water, Light & Power Company prior to its sale to the town of Milton, the Wisconsin Railroad Commission held that consideration should be given to an investment in power-plant equipment discarded after connection with a transmission line, to past deficits, to land acquired after valuation proceedings were begun and to a well situated on private property and used as a water-supply source, provided that title was transferred to the municipality.

**Exclusion of Record of Rate Fixing in One Borough Approved in Case Affecting Another Served by Same Utility.**—In a rate hearing affecting the borough of Conneautville the Pennsylvania Public Service Commission excluded records of a similar hearing affecting the borough of Albion which were offered by the United Lighting Company, serving both boroughs, on the plea of the former borough that it had not been a party to the previous proceeding. The commission found that the allocation of property between the two boroughs was not vital or material.

**Street-Lighting Rates — Interstate Business—Uniform Accounts.**—Establishing new rates for the Pembina Light & Power Company, the North Dakota Board of Railroad Commissioners asserted that a municipality should bear its proportionate share of the expense of maintaining an electric utility by paying adequate rates for street lighting, although as a large consumer it may be entitled to slightly reduced rates, the expense of billing and meter reading being less. Street-lighting rates should be put on a meter basis (Pembina and other towns had been paying a flat rate less than the cost of service). The Pembina company serves St. Vincent, Minn., and exports energy to two towns in Manitoba, Canada, and the commission fixed rates upon the assumption that towns served outside the state will be required to meet their portion of a necessary increase in revenue to meet operating expenses, depreciation and return. The bookkeeping system of the Pembina company was disapproved, and it was ordered to use the uniform system of accounting prescribed by the commission.

**Interest During Construction.**—The Maine Public Utilities Commission refused to allow the Central Maine Power Company to issue stock for the capitalization of interest accruing on the cost of dam sites purchased for future development. The commission contended that the company might later sell some or all of these properties, in which case it would have capitalized as "interest during construction" an item properly chargeable to investment account. When actual construction begins a change in the classification of the item might be sanctioned.

**Jurisdiction Over Mortgages.**—Asserting its jurisdiction (*in re* Wisconsin Utilities Company) over the giving of a mortgage on public utility property within the state, the Wisconsin Railroad Commission refused an application for permission to issue a mortgage covering the property of a Wisconsin utility in order to secure bonds of a foreign holding corporation on the ground that this would establish a precedent against public policy contrary to the clear intent of the stock and bond law and might create a condition under which the commission would be deprived of its entire jurisdiction over the regulation of the issuance of securities by a Wisconsin corporation.

**Should Pole Treatment Be Charged to Capital or Maintenance?**—The Public Utilities Commission of Idaho in a case affecting the Kootenai Power Company held that the cost of treating poles might be properly charged to capital rather than to maintenance. "If a pole has been put through a process which lengthens its service life to nearly double what it would have been without such process, it would appear," the commission observed, "that the cost of the application of the process should be added to the cost of the natural poles as an element to be considered in determining the value of the pole. The service life of the pole is a determining factor in estimating the percentage rate for depreciation allowance."

**Accuracy of Meter Service Accepted.**—One A. D. Sharp complained to the Massachusetts Department of Public Utilities that he had been charged $84 for electric service covering a period during which, as compared with similar periods, he should not have been charged more than $23. The complainant produced evidence in support of his contention, but the department, while holding that as a matter of business judgment the company might have been justified in making a rebate, maintained its belief in the accuracy of the meter records of the electrical energy delivered to the premises and took the view that either there must have been a leak in the interior installation, for which the company was not responsible, or that the amount consumed must for some reason have been far greater than the petitioner's calculations indicated. The petition was therefore dismissed.

**Original and Reproduction Cost.**—The New York Public Service Commission, according with the practice of other bodies, does not accept original cost as the sole criterion of the value of a utility. In appraising the property of the Adirondack Power & Light Corporation the commission made this observation: "Fairness to the property, to its owners and to its consumers does seem to require recognition of pre-war cost of the present properties increased so far as to regard what seem to be reasonably permanent present-day prices of such properties constructed under existing conditions, and including overhead costs which are reasonable and necessary to be incurred, together with a provision for organization covering what may be said to be preliminary to putting up the plant."

## Recent Court Decisions

**Insulation by Isolation.**—The trial judge having instructed the jury in Godfrey vs. Kansas City Light & Power Company that an electric wire by contact with which a boy was killed could have been isolated, the Kansas City Court of Appeals held the charge not to have been an error, despite evidence that there was no covering that could have been put on the wires, because a witness for the defendant included isolation within the term "insulation" and said that insulation by space is one of the best insulators known to the electrical world. "This evidence is not contradicted," the Court of Appeals said. "The record is undisputed that this wire could have been insulated by isolation, and in view of this testimony we do not think that the assumption in the instruction that the wire could have been insulated was improper." (247 S. W. 451.)*

**Temporary Injunction Granted Against Increase of Contract Rates.**—The Supreme Court of South Dakota held, upon a demurrer by the Mitchell Power Company against a motion by the city of Mitchell for a temporary injunction to restrain the company from charging rates in excess of those specified in its franchise and from discontinuing its service, that while the city and the company were powerless to make an irrevocable contract as to rates, yet the rate specified in the franchise, in the absence of negative allegations, will be presumed to be a reasonable rate for the purpose of considering the sufficiency of a complaint on demurrer, and on a hearing of a motion for a temporary injunction a like force will be given to such specified rate, in the absence of affidavits tending to show that it is unreasonable. (190 N. W. 1013.)

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## H. L. Geisse President Wisconsin Association

Harold L. Geisse, who was elected president of the Wisconsin Utilities Association at its recent convention in Milwaukee, is the secretary and general manager of the Wisconsin Valley Electric Company at Wausau, Wis. After his graduation from the University of Wisconsin in 1907 he served as statistician with the Railroad Commission of Wisconsin for one year and then joined the San Antonio Gas, Electric & Traction Company in Texas. But upon returning to Wisconsin in 1913 Mr. Geisse re-entered the employ of the Railroad Commission as statistician and subsequently was promoted to be assistant secretary and finally secretary. In the spring of 1919 he became associated with the Northwest Utilities Company, an Insull property, and later operated the Janesville Electric Company. Mr. Geisse remained with this organization until August, 1921, when he took charge of the Wisconsin Valley Electric Company.

H. L. Geisse

Bruno Rahn of the Milwaukee Gas Light Company was elected vice-president of the Wisconsin Utilities Association and John N. Cadby of Madison was re-elected executive secretary. George A. Mills, general superintendent of the Wisconsin-Minnesota Light & Power Company at Eau Claire, Wis., in charge of construction and operation, is the new chairman of the Electric Section of the association.

**T. C. Martin**, past-president of the American Institute of Electrical Engineers and executive secretary of the National Electric Light Association for a number of years, has just returned from Europe after a short sojourn abroad.

## F. M. Feiker to Direct Surveys at Washington

F. M. Feiker, assistant to the president of the McGraw-Hill Company, Inc., has, at the request of Secretary Hoover of the Department of Commerce, again received leave of absence to undertake the organization and general direction of the world surveys of raw-material supplies, rubber, sisal, hemp and nitrates, for which Congress made an emergency appropriation of $500,000.

Mr. Feiker served as assistant to the Secretary of Commerce during the first year of Mr. Hoover's administration, acting as general assistant in organizing the personnel and industrial trade contact committees in relation to the Bureau of Census, the Bureau of Standards and the Bureau of Foreign and Domestic Commerce. Out of his nine months' work came the monthly statistical survey of the Bureau of Census, the Division of Simplified Practice of the Bureau of Standards, *Commerce Reports* in new form and fifteen so-called commodity divisions of the Bureau of Foreign and Domestic Commerce. Of this latter work the annual report of Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, said: "The important task of carrying on this liaison work with the industries was under the general supervision of F. M. Feiker, assistant to the Secretary of Commerce. Mr. Feiker's extensive experience and wide contact with industrial organization and individual manufacturers are largely responsible for the striking success which has accompanied this innovation in the organization of a government department."

## Elihu Thomson Honored on His Seventieth Birthday

Congratulations by wire, mail and spoken word poured in upon Dr. Elihu Thomson, consulting engineer General Electric Company, on Thursday of last week, when that beloved leader of electrical development attained the age of seventy. A celebration dinner was held at the Boston City Club, which was attended by about seventy-five friends and associates. W. C. Fish, former manager of the Lynn works of the company, was toastmaster. Vice-president G. E. Emmons, Schenectady, presented the guest of honor with a loving cup, and congratulations by letter were received from Thomas A. Edison, Dr. Charles P. Steinmetz, President Gerard Swope of the General Electric Company, O. D. Young, chairman board of directors, and President S. W. Stratton of the Massachusetts Institute of Technology. E. W. Rice, Jr., and W. R. Whitney cabled good wishes from Europe, and among the speakers who lauded Professor Thomson's achievements in the field of invention and research were Dr. A. E. Kennelly of Harvard University, Prof. D. C. Jackson of the Massachusetts Institute of Technology, Prof. C. A. Adams of Harvard University, J. R. Lovejoy, vice-president General Electric Company; G. Faccioli, electrical engineer at the Pittsfield works, and M. de Marjorie of the French Academy.

## C. O'B. Murphy General Manager of Indiana Company

Charles O'Brien Murphy has recently been elected vice-president and general manager of the Central Indiana Power Company. Before engaging in the public utility business Mr. Murphy spent twelve years in Wall Street with W. H. Granbery & Company, Street & Norton and E. Clarence Jones & Company, all members of the New York Stock Exchange. During that time he became familiar with corporation securities and financing, leaving Wall Street as office manager for E. Clarence Jones & Company, specialists in bonds. Subsequently Mr. Murphy went West, where he became interested in public utility work. As vice-president and general manager of the United Light & Power Company and its subsidiaries, supplying electric light and power in and around San Francisco Bay, he helped to install central-station steam heating in San Francisco. When the Great Western Power Company of California took over the United in 1916 Mr. Murphy was retained in an executive capacity. In 1917 he became affiliated with the American Public Utilities Company of Grand Rapids, Mich., as assistant general manager, and one year later he joined the Merchants' Heat & Light Company, one of the properties forming the Central Indiana Power Company, as vice-president and general manager.

C. O'B. Murphy

### Sir J. J. Thomson Arrives

Sir Joseph J. Thomson, British physicist, who arrived in New York Monday, March 26, on board the Majestic, delivered the principal address at the meeting of the American Chemical Society in New Haven Wednesday night, April 4, selecting for his subject "The Unity of Physics and Chemistry." Sir Joseph will give a course of lectures before the Franklin Institute, Philadelphia, on April 9 to 14. Shortly after his arrival he was the guest of the Western Electric Company at a luncheon at its Bell System laboratories attended by F. B. Jewett, vice-president, in charge of the telephone department of the Western Electric Company; E. B. Craft, chief engineer; E. H. Colpitts, assistant chief engineer, and other company executives. After luncheon the party was escorted through the research plant.

Sir Joseph J. Thomson received the Nobel prize for physics in 1906. He was Cavendish professor in experimental physics in the University of Cambridge from 1884 until his resignation in 1918. During this time he developed a great research laboratory which attracted workers from all parts of the world. In 1918 he was elevated to the mastership of Trinity College, Cambridge, and in 1919 was elected to a newly established professorship of physics in the Cavendish Laboratory. He has been the recipient of many British and foreign awards and honors, is the author of treatises and textbooks on physics and is popularly known as the discoverer of the electron.

### Col. Charles Keller Resigns

Col. Charles Keller, a widely known officer of the Corps of Engineers, U. S. A., who has served for the past two years as engineer commissioner of the District of Columbia, has resigned as a district commissioner to undertake important duties in connection with hydro-electric development on the Pacific Coast. Colonel Keller was not communicative regarding his new duties, but it is understood that he has been employed by the Eldorado Power Company, a subsidiary of the Western States Gas & Electric Company, to undertake the direction of the engineering work on the South Fork of the American River. The development planned at that point is confronted with engineering difficulties of unusual magnitude. Throughout his engineering career, which began with his graduation from West Point in 1890, Colonel Keller has taken great interest in water-power development. As the representative of the War Department he supervised most of the important installations at Niagara Falls, and he was the representative of the department who assisted in drafting the federal water-power act.

**Fred H. Smith** has been elected vice-president of the Worcester (Mass.) Electric Light Company. Mr. Smith is one of the best known central-station men in New England, having been assistant general manager of the Worcester company for about ten years and prior to that its electrical engineer. He is a past-chairman of the Commercial Section of the New England Division, N. E. L. A. He will continue the work of assistant general manager in his new post.

### D. W. Snyder Heads Illinois Electric Association

D. W. Snyder, the new president of the Illinois State Electric Association, has been general manager of the Bloomington & Normal Railway & Light Company since 1917. After his graduation from Lafayette College in 1907 with an E.E. degree he entered the East Pittsburgh works of the Westinghouse Electric & Manufacturing Company. The year 1909 was spent in construction work, and one year later he joined the Northampton Traction Company, Easton, Pa., as superintendent. From 1911 to 1914 he served as manager of the Clinton Gas & Electric Company, Clinton, Ill., and in 1915 he became connected as general superintendent with the Jefferson City Light & Power Company. Subsequently he was appointed to the position he now holds in Bloomington, Ill. Mr. Snyder has been an active member in the association's work, having for the past three years served as chairman of the rural-lines committee and as vice-president in 1922. He is also a member of the N. E. L. A. rural-lines committee.

D. W. SNYDER

## Obituary

**Charles F. Cuno**, president of the Cuno Engineering Corporation, manufacturer of electric starting devices for automobiles, Meriden, Conn., died at Miami, Fla., March 14, at the age of sixty years.

**George H. Guy**, for the last forty years secretary of the New York Electrical Society, died of pneumonia on April 1 at the Long Island College Hospital. Mr. Guy was one of the leading spirits among those who obtained from Andrew Carnegie the gift of $1,500,000 from which sprang Engineering Societies Building and the Engineers' Club in New York City. He conducted a scientific press bureau for many years and was a contributor to the columns of the *Evening Post* and the *Globe*. Mr. Guy was a member of the A. I. E. E. and the Engineers' Club. He was seventy-six years old.

**Major Abram J. Gifford**, formerly in charge of the transportation department of the General Electric Company for many years, died March 20 at his home in Schenectady after an operation. He was seventy-four years old. In 1891 Major Gifford became associated with the Northeast Thomson-Houston Company at St. Paul, whence he was transferred in 1894 to the transportation department of the General Electric Company at Chicago. In 1899 he was put in charge of the transportation interests of the company and moved to Schenectady, where he resided until the time of his death. On March 1, 1920, he gave up his active duties, but continued on in an advisory capacity.

**Philip I. Robinson**, who was appointed manager of the Baton Rouge (La.) Electric Company recently, died on March 22 after a short illness. Mr. Robinson entered the statistics department of Stone & Webster, Inc., Boston, in 1908 and was soon transferred to Houghton, Mich., where he advanced to the post of superintendent of lighting for the Houghton County Electric Light Company in 1917. For about five years he was manager of the Fort Madison (Iowa) Electric Company and Dallas City (Tex.) Electric Company. Mr. Robinson was born in 1886, his home being at Waterville, Me., and was graduated in electrical engineering from the University of Maine in 1906.

**Dr. Walter Gill Wylie**, for many years intimately associated with water-power development in the South, died at his home in New York City on March 13 at the age of seventy-five years. Dr. Wylie was born in Chester, S. C., and besides being a surgeon of note was the first president of the Southern Power Company of Charlotte, N. C. He helped to organize the Anderson (S.C.) Water, Light & Power Company and later the Catawba Power Company. Early in 1900 he interested J. B. Duke, the tobacco magnate, in the water-power possibilities of the Carolinas, and shortly afterward the Southern Power Company, which has since grown to be the dominant power company of the South, was formed with Dr. Wylie as its head. Professional work in New York caused him later to relinquish the presidency to J. B. Duke, but his interest in industrial and power development continued unabated. Dr. Wylie was consulting surgeon of Bellevue Hospital and professor emeritus of the New York Polytechnic school of medicine for post-graduates. Besides being a member of numerous professional bodies he was a member of the Engineers' Club of New York, next door to which he lived.

## Logical Outlet and Profit

**Urges Careful Analysis of Market—If Jobber Is to Sell 9 per Cent of Output, Is He to Receive 9 per Cent of Support?**

By W. A. Kennedy

Sales Manager Sibley-Pitman Electric Corporation, New York City

NATIONAL manufacturers have asked me to give them a recipe for success in electrical merchandising. I am quite willing to give it to them. There ought not to be anything confidential about it. It is a very old recipe — "character and knowledge." Getting business "any old way" is not an evidence of either character or knowledge. Business taken on the wrong basis today—even at a profit of $1,000—may seriously retard a manufacturer's progress for a year, with a failure to gain a possible profit of $30,000 tomorrow.

A manufacturer must have knowledge of his market—not casual knowledge, but a student's analytical knowledge. In applying his knowledge in the establishment of his policy he must have character — character enough to resist temptation, character enough to keep his head and push on, character enough to keep swimming up stream with a bone in his mouth, holding to the substance and ignoring the shadow.

The electrical industry is spending a considerable part of its time discussing the relative merits of electrical contractor-dealers, factory stores or department stores and where the jobber fits in with the ethics and profit—or loss—of canvassing for sales. In the electrical industry we are simply selling appliances on a pure basis of hit or miss. The manufacturer, the jobber and the retailer in virtually every city are working entirely in the dark so far as definite knowledge of the local market is concerned and knowledge as to how much they ought to spend and what they ought to do to develop. They do not know what the market really is. They do not analyze it from the standpoint of potential sales.

Suppose a manufacturer should decide to enter the New York City market with a campaign on vacuum cleaners. Here is a city of nearly six million inhabitants and a suburban territory within 50 miles having a total population of slightly under five million. The usual way is to break loose with advertising, send out salesmen, set up jobbers or dealers, and then see how much business can be obtained, without determining in advance any single fact but that the people are there and therefore the market must be there.

W. A. Kennedy

It would be easily possible, however, to develop the facts from existing and accurate tables on wired homes, central-station customers, location of population, etc. From such accurate analysis the manufacturer would find that there are, for illustration, 750,000 wired homes within the metropolitan and suburban area that may be considered "prospects" to which the vacuum cleaner may be sold in advertising. If this manufacturer were to come to me in a spirit of analytical and intelligent co-operation, we could determine that there are 450,000 possible purchasers, and the manufacturer, considering all elements of sales resistance as well as sales potentialities, could definitely determine the number of machines which he could apportion to his territory. If his total output is to be 100,000 cleaners and he feels that he can assign 9,000 to the New York territory, then that means that I am called upon to do a 2 per cent job. I must sell 2 per cent of the apparent "prospects." That is all, but how many times has any manufacturer ever looked upon such an equation?

Since I am to sell 9 per cent of the manufacturer's output, it is not unreasonable for me to expect 9 per cent of his advertising and sales appropriations to be spent in furthering the New York campaign. If his appropriation for promotion is, for illustration, $100,000, then I am entitled to $9,000 less that proportion of the cost of national publicity represented by its circulation and value within my territory.

### Importance of Advertising

No sensible jobber is apt to minimize the importance and value of national advertising. Such jobbers are aware that national reputations are made this way. An intelligent manufacturer could clearly show to any jobber how much of the national advertising is going into any particular local territory. The figures are always available. The proportion that the local jobber is receiving from a national campaign therefore can be figured out for him, but the allowance for local advertising should be in proportion to the job which the manufacturer expects him to do.

Such an arrangement cannot be one-sided. If the manufacturer is devoting 9 per cent of his sales promotion appropriation to a local campaign in which the jobber is expected to do a 2 per cent selling job, he should be willing to add to the manufacturer's appropriation an amount of money represented by the difference between the gross profit and operating expense up to a figure equal to the manufacturer's expenditure. Figuring this difference to be $3 per machine upon vacuum clean-

ers, the jobber should contribute $9,000, or net profit on the first 3,000 machines, the remaining 6,000 producing a net profit of $18,000. Whenever such fundamental principles are followed, we shall be able to do not merely a 2 per cent selling job, but a real job. On such a basis the jobber and the manufacturer combine their publicity and selling effort, and both enjoy the profit.

A campaign of this kind, predicated on accurate knowledge of the opportunity, a definite purpose in the undertaking and a clear understanding of the obligation on both sides, will put the selling of electrical merchandise on a plane that will be both profitable and constructive. The usual methods are tremendously wasteful. The manufacturer thinks in generalities, and his salesmen talk in generalities. The sales policy, if they have one, is framed at the factory with little or no regard for local market conditions. They don't know how many homes are wired in a town. They don't know how many people own their own homes. They don't know what they should or must spend to get the business. They don't know the source of the business when it comes. The scope of central-station companies serving the community is seldom if ever known. The average salesman is content to merely ask "Why don't you place an order? So-and-so has already done so."

Little headway will be made by any manufacturer in trying to determine on a purely theoretical basis how electrical appliances can best be sold—whether by establishing stores of his own, or through department stores, or through central stations, or through still some other channel. Every now and then you hear some manufacturer say that the electrical contractor-dealer is not a good merchant.

But let us consider for a moment whether or not there is a logical outlet, and, admitting that there is, my opinion is that it is within the electrical industry, and that it is based upon electrical contractor-dealers working in harmony and co-operation with the central-station companies

There has been a tendency on the part of some central stations to minimize the value of jobber to contractor-dealer distribution, and were the forces of the central stations and the contractor-dealers harnessed together properly, the question of logical outlet would be solved.

Central stations through their display rooms can select and direct the consumer in the use of appliances of approved merit, and with their facilities for making collections they can perform both sound and economical functions for the industry and by so doing obtain the support and interest of jobbers in the distribution of approved appliances, because in the final outcome the consumer looks to the central station for satisfactory service during the life of the appliance.

### Taking the Jobbers' Profits

Such a result, however, is retarded when any central-station company, in consideration of the volume of its purchases, obtains the jobbers' cost from the manufacturer and, because it is not performing any wholesale functions, passes along the compensation to the consumer. It would seem fundamental to me that when central stations recognize wholesale consumers of energy, who in turn distribute the energy to retail consumers, they should recognize without argument that the jobber is rightfully entitled to a wholesale profit, which is necessary to compensate for the labor and expense of service given retail dealers.

While the channel of distribution is important—and I believe it exists within the electrical trade—it is not nearly so important as the analysis of the market, the making of a definite policy and then sticking to it. Sound sales volume is not built overnight. What we want in electrical merchandising campaigns is more advance knowledge, more planning and more purpose—in other words, "character and knowledge."

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

FEAR of inflation following the unusually heavy purchasing during these last few weeks is causing considerable comment among the leaders of the larger manufacturers of the industry, and methods of curbing "dangerous buying" have already been adopted in different sections of the country where credit risks are being carefully scrutinized. In addition, a few bulletins warning against overloading the markets have been issued, but it is felt that this practice will not be widely followed by any sensible manufacturers who have already been through any one or two periods of inflation and who must well realize now that it is better to scrutinize accounts than to disregard and discourage them. Prices in the raw-material markets continue to go higher, and while copper has recovered about 45 per cent from the low levels of August, 1921, it is believed that still higher prices will come before the present boom has ended. Authorities in copper circles believe that the peak levels will not be reached for some time and that quotations will react sooner than will other commodities, as the red metal fluctuates most easily. Other advances in the porcelain, wire and iron-pipe markets are laid to general business conditions and up to the present time have been accepted by the larger manufacturers quite readily.

### British Competition and Her Effort to Keep Skilled Labor

ALARMED by the loss of skilled workmen in the United States, Great Britain is taking determined steps to stem that type of emigration. This is thought to account for the recent very low prices which British manufacturers of electrical and other machinery have quoted on export bids. British manufacturers recently were able to underbid their American competitors for large orders in Canada and Brazil, at figures which indicate that little margin was left above the bare cost of labor and materials. At the same time, steps are being taken to increase the volume of domestic business in the hope that the earnings of skilled workmen will be sufficiently attractive to keep them at home. British manufacturers apparently are having some difficulties in their relation with the public at home. There seems to be a widespread feeling that the domestic market has been exploited so as to make possible sales at much lower prices in order to extend foreign trade. Domestic prices on electrical equipment have been such as to permit material inroads into the home market by German manufacturers. Now that they are faced with the departure for America of many of their skilled operatives, they are having difficulty in placating a rather hostile public.

### Americans Do Not Expect to Get Europe's Larger Equipment Orders

THE extension of railway electrification now being undertaken in several of the European countries is not expected to bring orders to this country for the larger equipment needed, according to manufacturers in this country, but it is certain that some of the high-voltage equipment and supplies will be bought here. Also there will be purchases of American specialties, such as signal devices, switches and train-dispatching telephones.

The rising standards of living in China, Japan and India offer an improving market for American electrical specialties. The Oriental is particularly inclined to purchase anything novel. At present the United States is not getting the proportion of this business that it might expect owing to the fact that it has such poor selling facilities in those countries.

The drought during the past season has made it clear to the new hydro-electric companies in Japan that they must install steam auxiliaries. It is believed that the Japanese will soon be in the market extensively for much steam-plant equipment. The demand for power in that country is increasing by leaps and bounds to a point where there is a much greater demand for heavy loads throughout the entire year. The Japanese rivers are short and the opportunities for storage are few. As a result, the opportunity for equalizing the flow of their power streams is much less than in most other countries.

### Occupation of Ruhr Affecting Demand for American Supplies

OCCUPATION of the Ruhr by the French and the cutting off of coal supplies from certain of the German plants engaged in manufacture of electrical goods is having a noticeable effect on the demand for American electrical goods abroad. The average order now reaching the American electrical manufacturers and jobbers is much larger than it was even three months ago. This is taken to indicate that the unsettling influence of low German bids has now been removed.

### Meter Sales Are in Large Volume with Improved Deliveries

DELIVERY conditions in the meter market are highly satisfactory at present as regards the more common sizes and types of watt-hour instruments, looking at the current large demand from the angle of factory production and shipments. A few weeks ag · it was reported that central-station buyers of meters would be wise to look farther ahead in placing orders. At that time rail embargoes and blockaded highways in the North were hampering transportation of both raw and finished materials so badly that there was at least a possibility of inconvenience in the supply of meters if the development of the building industry continued apace. Conditions have now improved materially on the road, and the larger manufacturers of meters have accumulated reasonable stocks of materials and are able to make prompt deliveries of standard lines either from the factory direct or out of district office stocks. The demand is very active, although perhaps a little below the 1920 peak. Overseas trade is poor and is handicapped by Continental competition. There is some tendency toward the more general use of 10-amp. meters in residential service as the number of appliances in use in the home multiplies, but the well-known overload capacity of the 5-amp. meter stands in the way of any very rapid change here. Industries and utilities are using more graphic equipment. Labor is in fair supply in meter factories, and women are extensively employed in this field. Prices are steady, with little tendency toward fluctuation.

### Farm-Lighting Sets About to Enjoy More Active Market

RESTRICTIONS upon travel in rural districts in the northern sections have impaired the growth of farm-lighting business in some quarters, although the total volume of trade is probably somewhat ahead of last year's. A slow opening up of this field is anticipated, followed by a good year's business, reaching its peak in the summer or fall. Little trouble is expected from low stocks in the larger distribution depots, for it has been the practice in the more progressive of these organization branches to carry stocks capable of meeting a demand considerably in excess of the present volume. Some manufacturers have stiffened their prices to at least a moderate degree as a result of increased production costs, but not all have done this as yet. The outlook is for a general falling into line on price movement before long if present labor and material costs do not come to a halt or decrease. One large manufacturer is still selling on a 1917 price basis and has made no change of importance in five months. Confidence as to the outlook is widespread.

### Irregular Demand for Tools Due to Accumulated Stocks

OWING to the previous accumulation of considerable stocks by distributors, the demand for electric tools as felt by representative manufacturing interests is at present somewhat uneven from week to week, although the general trend of sales is upward. Factories are busy, however, and the increasing shortage of labor in industry is stimulating interest in the economic utilization of electrically operated drills, industrial irons and many other appliances designed to expedite shopwork. Current stocks are sufficiently lowered now to require more attention to purchasing, and there are still intermittent embargoes on the railroad lines between factory and distribution points. As in other lines, raw material and labor costs are stiffening, and price trends are correspondingly firm.

### Prime-Mover Prices Hardening with Rises in Labor and Material

INCREASING demands for central-station service throughout the country continue to cause orders for steam turbo-generator sets to accumulate at the manufacturing plants. Broadly speaking, the 1923 output has been sold out for many weeks if not for several months, and it is unsafe to figure on less than a year in estimating deliveries of large units. In the field of large plant development the 30,000-kw. unit continues popular as the normal upper limit of routine heavy practice. Probably upward of a million kilowatts of such units are now on order in this country. Turbine development along the line of increasing reliability of operation continues to absorb the efforts of designing engineers, and the approaching commercial application of the mercury boiler and turbine has aroused wide interest in commercial as well as in engineering circles. Higher boiler pressures are readily coming into service, superheat is being pushed upward, and something like a race in size development is under way between steam and hydraulic turbo units. The whole prime-mover market is alive with new developments; proposition work is fraught with unprecedented interest, and existing long deliveries have little effect upon competitive activities. Raw materials, long anticipated as to requirements, are in good stock at the factories, but the upward trend in costs of material, labor and overhead tends to harden prices at this time.

### Signal Apparatus Strong with Orders from New Schools

ELECTRICAL signaling equipment is in excellent demand at present, school construction in many localities requiring liberal purchases of this line of material. Factory stocks are reported in good shape, and the making up of systems for interior telephone, annunciator and call-signal work is readily effected from existing parts in current storage. Many jobbers appear to leave the sale of these systems to the manufacturers, although some parts are carried for replacement service and a small installation work. Prices are firm and so far little complaint has been heard regarding the ability of manufacturers to obtain raw material in plants where the purchasing department is sensitive to pending delivery conditions.

### English Electrical Exports Fell £56,296 in February

THE following are official values of electrical machinery, apparatus and material exported from England (a) during February, 1923, and (b) from Jan. 1 to Feb. 28, with increase or decrease compared with the corresponding periods of 1922. The total of electrical machinery, material and apparatus, other than insulated wire, was £936,482 for February, which was a decrease of £56,296 from those exports during the month of February, 1922.

Electrical machinery, (a) £284,290 (decrease £99,725), (b) £719,192 (decrease £232,087); including railway and tramway motors, (a) £28,170 (increase £12,992), (b) £44,991 (increase £13,-935); other generators and motors, (a) £131,968 (decrease £45,272), (b) £386,-027 (decrease £135,712), and other electrical machinery, (a) £124,152 (decrease £67,445), (b) £288,174 (decrease £110,310); telegraph and telephone cables, submarine, (a) £27,274 (decrease £33,811), (b) £102,395 (increase £37,917); other than submarine, (a) £67,000 (increase £32,766), (b) £121,-909 (increase £6,012); telegraph and telephone apparatus, (a) £170,932 (in-

## Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | $0.0322 | $0.0312 | $0.0229 |
| Cold finished shafting, per lb. | 0.0406 | 0.0402 | 0.0317 |
| Brass rods, per lb. | 0.1904 | 0.1804 | 0.15 |
| Solder (half and half), per lb. | 0.314 | 0.2617 | 0.20 |
| Cotton waste, per lb. | 0.1231 | 0.1181 | 0.109 |
| Washers, cast iron (½-in.), per 100 lb. | 4.50 | 4.33 | 3.83 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 2.96 | 2.96 | 3.11 |
| Machine oil, per gal. | 0.349 | 0.349 | 0.40 |
| Belting, leather, medium, off list | 42% | 49% | 46¾% |
| Machine bolts, up to 1-in. x 30-in., off list | 48⅓% | 51⅓% | 64½% |

crease £31,200), (b) £345,656 (decrease £15,147); other electrical wires and cables, rubber-insulated (a) £95,301 (increase £54,375), (b) £213,562 (increase £116,516); with other insulations, (a) £90,433 (decrease £24,550), (b) £176,788 (decrease £62,161); carbons, (a) £3,489 (increase £1,126), (b) £10,159 (increase £1,053); glow lamps, (a) £26,206 (decrease £3,377), (b) £55,238 (decrease £3,355); arc lamps and searchlights, (a) £300 (increase £159), (b) £746 (decrease £346); parts of arc lamps and searchlights (other than carbons), (a) nil (decrease £244), (b) £84 (decrease £697); batteries, (a) £47,168 (increase £23,169), (b) £94,523 (increase £36,130); electrical instruments (commercial and scientific), electricity meters, (a) £31,359 (decrease £4,369), (b) £56,993 (decrease £15,201); switchboards, (a) £7,538 (decrease £16,851, (b) £23,046 (decrease £87,318); other electrical goods and apparatus, (a) £85,192 (decrease £15,164), (b) £212,281 (decrease £10,995).

## The Metal Market

**Demand Is Less Active — London Prices Fluctuate Widely—Customers Are Scrutinizing Quotations**

The week in the metal market has been a quiet one with only small price changes. Prices in London have fluctuated widely, however, and the unrest in that country has without doubt had an adverse effect on business here. Consumption in most lines continues excellent. Copper continues at 17.37½ cents delivered. Producers are well sold up, and it is unlikely that they will force their copper on an unwilling market for some weeks, so that no important price recession is likely. It is a fact, however, that the demand for manufactured copper products has weakened since the price went above 17 cents. The customers of the wire and brass mills seem to be watching the price of raw copper more than they formerly did and to restrict their buying if they think the price has risen too fast.

Heavy exports are going to Germany; of the total of 2,793 tons exported last Wednesday, 1,837 went to Germany.

NEW YORK METAL MARKET PRICES

| Copper | Mar. 28, 1923 Cents per Pound | April 4, 1923 Cents per Pound |
|---|---|---|
| Electrolytic | 17.37½ | 17.37½ |
| Lead, Am. S. & R. price | 8.25 | 8 25 |
| Antimony | 8.75 | 8.75 |
| Nickel, ingot | 30.00 | 30 00 |
| Zinc, spot | 7.65 | 7.65 |
| Tin, Straits | 48.00 | 48.00 |
| Aluminum, 98 to 99 per cent | 26.00 | 26.00 |

### Copper and Brass Products

Copper, brass and bronze mills quote the following prices on brass and copper products:

Copper wire, 19.87½ cents, mill; brass wire, 22.50 to 24.00 cents; copper sheets, 25.50 cents; copper rods, 20.37½ cents; brass rods, 20 to 24.50 cents; sheet brass, 21.75 to 23.50 cents.

**Electric Elevator Manufacture.**—According to figures issued by the Department of Commerce there were 117 establishments making electric elevators in the United States during 1921. Value of their products was $29,414,000. In 1919 there were ninety-four establishments, whose output amounted to $29,607,000.

# The Week in Trade

**Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points**

BUYING in most sections of the United States continues in heavy volume with slight advances in prices of wire, conduit, wiring devices and some high-tension equipment following the rising quotations in the raw-material markets. Business in second-hand motors is gaining in the East owing to increased activities in the textile and metal-working fields. Warmer weather is bringing more outdoor construction, with the result that poles, wire and meters are moving rapidly. Spring lamp replacements are making up a fair amount of orders. Aluminum wire is said to be receiving added interest.

**Boston** Little recession can be seen in buying, which is still conservative and well adjusted to demands in sight. Prices have increased again on sockets and switch plates, and connectors for flexible armored conductor also are quoted higher. Deliveries are quoted at longer periods. Motor stocks are decreasing materially. Some types of radio tubes are unobtainable. Outdoor construction is opening up gradually. A compromise wage increase is expected in the building field. Banking conditions are in good shape and retail trade is excellent. Unemployment is causing little concern and railroad conditions are better.

**New York** Buying is in heavy volume with prices generally firm for the last ten days, although slight increases are noted for wiring devices. Business in new and second-hand motors is slightly stronger than a few weeks ago, with depletion of stocks here and there throughout the Eastern territory. High-tension-equipment business is picking up favorably with increased buying by utilities. Construction business has given the wire market another strengthening turn. Large orders of meters are reported with lamps selling in large lots for spring replacements.

**Atlanta** Business in jobbing circles continues fair with little change from last week. The higher prices for lumber have caused advances in poles and cross-arms, and while sales are good, deliveries are becoming slower. Heavy construction is taking large quantities of conduit, and although shipments have improved, it is impossible to accumulate satisfactory stocks.

**Pittsburgh** No price changes of any importance occurred during the week. Dealers report good sales of washing machines following large advertising campaigns supported by manufacturers. Other appliance business is rather slow. Radio demand is holding up fairly well.

**Cleveland** Great increase in orders is reported. Retail sales are increasing rapidly in seasonal articles and business from the utilities is favorable. Added residences have brought about a heavier demand for meters. Fixtures likewise are moving well. Aluminum wire is attracting a great deal of attention because of higher quotations in the copper market. Conduit deliveries are more prompt. The general price trend is firm with the exception of radio, where some cutting is evident. Lamps are stronger. Collections are reported at sixty days.

**Chicago** Brisk trade is reported by dealers in this territory. Considerable quantities of conduit are being placed despite its shifting prices. Demand for motors remains active. High-tension equipment and pole-line hardware buying is stronger. Pole stocks are normal. Advances are expected in wire.

**St. Paul-Minneapolis** Colder weather has halted spring campaigns by jobbers and contractors. Falling off in demand for poles and other construction material is noted.

# Demand, Supply and Price Trend of Nineteen Commodities as Sold in Sixteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Next Week Reports will include Washers and Cleaners; Irons and Storage Batteries

High-tension insulators have advanced 10 per cent, with stocks depleted and factories two months behind with orders. The conduit situation is slightly relieved. Radio orders from rural districts show slight improvement.

**St. Louis** Appliance sales for March showed a very appreciable increase over the same month of 1922. Motor and transformer manufacturers are operating to capacity and are considerably behind with their orders. Farm-lighting plant sales in this district during last month were greater than for any month since 1917. Demand for radio equipment continues active. Strong demand for wire, wiring devices and fixtures is reported as the result of a large house-wiring campaign now being carried on by a public utility. Calls for second-hand motors are increasing.

**San Francisco** A fine fan year is predicted. Perhaps it will be even better than 1922 because of improved business conditions. Drastic steamer rate increases are expected. The six weeks' dry spell has been broken by a well-distributed rainfall. Contractor and dealer business is increasing. San Francisco building permits for March totaled $3,229,572.

**Portland-Seattle** Business is reported good, and building in this district continues to exceed last year's records. Prices generally are stronger. Conduit stocks are improving and incoming shipments are increasing. Deliveries in lead-covered cable are poor, shipments on paper-insulated being at thirty weeks and cambric at twenty weeks. Lamp demand is following seasonal requirements.

**Denver** Volume of sales for most lines is larger. Increased wage scales effective last week apparently have not affected the present heavy building program, and there is a marked absence of labor difficulties. Railroads report another increase in tonnage and car loadings, and incoming shipments are more prompt. Washing machine, range and vacuum-cleaner campaigns are being carried out in this territory with satisfactory results.

Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Vye-Smith Company, Inc., Opens New Boston Jobbing House

Murvyn W. Vye and Ray H. Smith have organized a new electrical supply jobbing house under the name of Vye-Smith Company, Inc., and will open for business at 199 Purchase Street, Boston, April 2. Mr. Vye is widely known in New England electrical circles, having recently been vice-president of the McKenney & Waterbury Company, Inc., of Boston, and for some years previous sales manager of the Wetmore-Savage Company, Boston. Mr. Smith was formerly on the sales staff of the latter organization.

## Betts & Betts Open Branch Office in Philadelphia

The Betts & Betts Corporation, 645 West Forty-third Street, New York City, has recently opened a branch office in Philadelphia in charge of Vernon H. Walker as district manager at 1536 Cherry Street, where space has been provided for a complete line of stock. Frank Wolk, who has been actively engaged in the radio market in New York City, is now connected with Betts & Betts in charge of the metropolitan district sales staff.

## Organizes Transmission and Street Lighting Department

The Capital Electric Company, Salt Lake City, has inaugurated a policy whereby its technical sales problems will be handled by a competent engineer. The company has organized a transmission and street-lighting department which is in a position to go into the engineering features of customers' problems. This department has been placed in charge of K. V. Laird. Mr. Laird is an experienced electrical engineer and a graduate of the University of California. He was formerly employed by the Anaconda Copper Mining Company in Montana and was also associated with the Gellert Engineering Company in Philadelphia.

## Standard Turbine Makes Sales Appointments

The Standard Turbine Corporation, Wellsville, N. Y., announces the following appointments of representatives in connection with the sale of their steam turbines: Fred H. Dorner, 548 Milwaukee Street, Milwaukee; Craun-Liebing Company, 30 Euclid Arcade Annex, Cleveland; L. S. Vallely and Company, Whitney-Central Building, New Orleans; Leonard G. Payne, 806 Otis Building, Philadelphia; Castle & Wilson, 1601 Arrot Building, Pittsburgh.

The Standard Turbine Corporation, is manufacturing steam turbines in capacities up to 500 hp.

## Am-plus Storage Battery Makes Rapid Recovery After Fire

The Am-plus Storage Battery Company, Chicago, in less than two months after a fire which on Jan. 24 nearly destroyed its plant at 741 Van Buren Street, has established an entirely new plant at 429 West Superior Street, where the manufacture of its products has been resumed under improved conditions. The new plant, besides having double the floor space of the old one, is newly equipped with entirely new machinery and is so laid out as to greatly facilitate manufacture, assembly and shipping. Provisions have been made for expansion on a large scale.

## Philadelphia Firms to Exhibit at Civic Industrial Exposition

The Troupe Electric Company, Ambrose Diehl Electric Company, F. J. Saylor Company, Voight Company, Emery & Son, Abso Clean Sales Corporation, the Better Home and the Vital Sales Company, all of Philadelphia, have arranged for displays in the Philadelphia Palace of Progress, a civic-industrial exposition to be held in the Commercial Museum May 14-26.

The exposition will celebrate the two hundred and fortieth anniversary of the founding of Philadelphia and will represent the civic and industrial advancement of the city. All of the firms here mentioned will exhibit electrical appliances.

## Electric Machinery Changes

The Electric Machinery Manufacturing Company, Minneapolis, manufacturer of synchronous motors and alternators, announces that F. F. Espenschied has been appointed in charge of its Pittsburgh office in the Union Arcade Building. The company also announces the establishment of its Cincinnati office in charge of C. G. Tarkington in the Mercantile Library Building.

## Radio Corporation of America Report Shows Rapid Growth

The stupendous strides made last year in the development of its system of world-wide wireless and outlines of a comprehensive program of expansion in all parts of the world are reviewed in the annual report for 1922 of the Radio Corporation of America, issued to stockholders last week.

The extent to which business expanded in 1922 is shown by the fact that gross sales amounted to $11,286,489, compared with only $1,468,919 for 1921, and gross income totaled $14,830,856, against $4,160,844 for the year preceding. After all deductions, including reserves for amortization of patents, federal taxes and organization expenses were written off, there was a surplus of $2,974,579, an increase of $2,547,780.

Current assets of the company at the end of the year were $8,686,907, contrasted with current liabilities of $2,688,941. Of the assets $946,888 was cash, $2,445,925 accounts and notes receivable and $5,041,213 inventories. Current assets exceed the current liabilities by $5,997,966.

## General Electric 1922 Sales Were $200,194,294

The General Electric Company reports net sales of $200,194,294 for last year, against $221,007,992 in the previous year. Despite the drop of approximately $21,000,000 in the volume of business, the net profits were larger than those reported in the previous year.

| | †1922 | †1921 |
|---|---|---|
| Net sales | $200,194,294 | $221,007,992 |
| Costs, expenses, etc. | *177,458,012 | *199,331,309 |
| Balance | $22,736,282 | $21,676,683 |
| Other income | 8,058,684 | 6,478,984 |
| Total income | $30,794,966 | $28,155,667 |
| Inventory reserve | ........ | 3,700,000 |
| Interest | 4,563,947 | 2,802,855 |
| Surplus | $26,231,019 | $21,652,812 |
| Cash dividends | 14,073,628 | 13,409,522 |
| Stock dividends | 8,717,265 | 6,746,114 |
| Surplus | $3,440,126 | $1,497,176 |
| Appropriations | 400,000 | 1,418,864 |
| Previous surplus | 70,126,921 | 70,048,611 |
| Profit and loss surplus | $73,167,047 | $70,126,921 |

*Includes depreciation, federal taxes, &c.
†Excludes accounts of International General Electric.

After payment of all expenses, charges and taxes and allowances for depreciation, net profits for the year were $26,231,019, which after dividends on the special $10 a share par value stock was equal to $14.86 a share earned on the $175,624,746 common stock of $100 a share par value outstanding at the end of 1922. The net profits for the previous year amounted to $12.57 a share on the $172,194,300 capital stock then issued.

The consolidated balance sheet showed total assets of $355,445,492. Cash holdings were carried at $49,482,770 at the close of 1922 against $39,888,683 at the close of 1921; investments were valued at $63,892,232 against $75,326,382; government securities, $35,858,768 against $23,862,912; notes and accounts receivable $35,154,419 against $52,514,902, and inventories at $75,334,562 against $64,848,189. A total of $13,874,385 cash is carried in sinking-fund reserve. Accounts payable totaled $13,415,954 against $9,495,261.

## Westinghouse Authorizes Sale of $14,962,530 Common Stock

Directors of the Westinghouse Electric & Manufacturing Company at a meeting last Wednesday authorized the sale of $14,962,530 additional common stock, which will be offered to stockholders at a subscription price of $53 a share, to the extent of one share of new stock for each five shares now held. The offer will be made to stockholders of record April 16. Payment for the stock must be made in full by May 31. In connection with the offering of new stock, Guy E. Tripp, chairman of the board of directors, sent the following letter to stockholders:

"Your company has a large amount of unfilled orders on hand, and is taking additional orders in large volume. In addition, the directors believe that there will be a still further enlargement in the demand for your company's products, due to the public attention which is now being directed toward hydro-electric developments, steam railroad electrification, industrial electric manufacturing processes, further development of activities in the radio field and a widening use of electricity for other purposes, all of which would stimulate still greater activity in your various manufacturing lines.

"After applying the proceeds of the sale of the new issue of common stock, the net quick assets of the company, as of March 31, 1923, will amount to $105,000,000.

"The net profits of your company available for dividends for the fiscal year ended March 31, 1923 (March estimated), will amount to about $12,000,000, while the dividend on the shares of your company, including the new issue of stock, at the rate now being paid, viz., 8 per cent per annum, will be $7,182,000."

## Shakstad Moves to Larger Quarters

The Shakstad Electric Company, formerly at 213 West Ninth Street, Sioux Falls, S. D., has moved to larger and better quarters at 214 South Main Avenue, the same city, where it will be better prepared to give prompt attention to calls for new apparatus or immediate repairs to all makes of machines.

## Ohio Brass Earnings $1,398,863 in 1922; $722,440 in 1921

Net earnings of the Ohio Brass Company, Mansfield, Ohio, manufacturer of insulators and other equipment, during the year 1922 were $1,398,863, as compared with those for the year 1921 of $722,440. The company during the past seven years has shown total net profits of $5,229,295, or a yearly average of $35.56 a share on the outstanding preferred stock and $6.49 on the outstanding common stock.

During the depression period the company's business showed only comparatively small decline and the period resulted in no losses to the company.

Balance sheet as of Dec. 31, 1922, shows the following items: Assets: Cash, $700,038; notes and accounts receivable, $1,570,986; United States and other securities, $496,412; inventories, $1,443,138; total current, $4,210,574; plant and equipment, $2,781,056, making total of $6,991,630.

Liabilities: Accounts payable, $448,622; reserve for taxes, $250,000; total current, $698,622; preferred stock, $2,100,000; common stock, no par, $1,922,580; surplus, $2,270,428.

The company recently completed and placed in production a new plant at Niagara Falls, Ont., to gain a better foothold in the Dominion and other British territory and is also contemplating a large addition to its Barberton subsidiary, the Ohio Insulator Company.

**The New England Insulator Company**, New Freedom, Pa., a subsidiary of the American Insulator Company, manufacturer of electrical insulating products and other electrical equipment, has leased property from the Danbury Industrial Corporation, Danbury, Conn., for the establishment of a new plant. It is thought that the New Freedom works may be removed later to the new location.

**C. G. Everson & Company**, manufacturer of electric light fixtures, 70 West Lake Street, Chicago, has leased the five-story-and-basement building at the northeast corner of Erie and Green Streets, where it will move its manufacturing equipment.

**The Electric Storage Battery Company**, Philadelphia, has adopted a night shift in a number of departments, in addition to a maximum day working force, officials of that company announce.

**The Bell Lighting Company**, 385 Broadway, New York City, has been incorporated with a capital stock of $100,000 and will manufacture electric and gas fixtures. It is taking over the property and assets of the Campbell Lighting Company, New York City, which has been in this business for some time. At present parts are being manufactured under contract, the company's activities consisting principally of assembing. It plans to do a part of its own manufacturing some time in the near future. The incorporators are C. A. Campbell, W. Weigand and A. C. Worgren.

**The Home Specialties Manufacturing Company**, recently organized, has entered into a manufacturing agreement with the S. S. Wenzell Machine Company, Philadelphia, to manufacture electrical household appliances. The new company is represented by Joseph C. Haines, 301 Market Street, Camden, N. J.

**The Modern Sign Company**, 5750 Woodward Avenue, Detroit, has been incorporated with capital stock of $75,000 to manufacture electric signs and displays, also to do general commercial work in electric sign rental. The company has a well-equipped plant, since it took over a company which has b[illegible] manufacturing for about two years. I[illegible] is estimated that this year's sales w[illegible]l amount to about $200,000. C. L. Beswicke is general manager of the company.

**The Cliff Electric Corporation**, 59 Pearl Street, New York City, has been organized to manufacture and distribute electric phonograph motors. It is already on an operating basis, having a factory at Lebanon, N. H. S. A. Jacobs is president and I. M. Davis is secretary.

**The Quality Electric Company**, Los Angeles, manufacturer of electrical specialties, has plans in progress for the construction of a new one-story plant, 40 ft. x 175 ft., on San Pedro Street, and will call for bids at an early date.

**The Hoosic Engineering Company**, Hoosic Falls, N. Y., has been incorporated with capital stock of $20,000 to manufacture electrical products. Future plans of the company are undetermined, but no building will be undertaken at present. The chief incorporator of the company is E. Tiffiny.

**The B. & H. Electric Company**, Woburn, Mass., is taking bids until April 15 for the construction of a local plant 120 ft. x 175 ft. and 60 ft. x 150 ft. estimated to cost approximately $100,000, with equipment.

**The Rubber Insulated Metals Corporation** has moved its general offices from 50 Church Street, New York City to 18 Oliver Street, Newark, N. J. The new location will give the company larger accommodations and afford every facility for handling a steadily increasing business.

**The Superheater Company**, 17 East Forty-second Street, New York City, announces the appointment of J. S. Cothran, Charlotte, N. C., as its representative in North and South Carolina.

**The Cutler-Hammer Manufacturing Company**.—The Pittsburgh office of the central district of the Cutler-Hammer Manufacturing Company, Milwaukee will move on May 1 from the Farmers Bank Building to rooms 950 to 95[illegible] Century Building, on Seventh Street between Penn Avenue and Duquesne Way. A. G. Pierce is manager of this district.

**The Bullock Manufacturing Company**, 356 West Fortieth Street, New York City, manufacturer of lighting fixtures, has purchased two four-story buildings, 33 ft. x 102 ft., at 352-54 West Fortieth Street, for plant extensions.

**The Electric Porcelain Manufacturing Company**, Trenton, N. J., has filed plans for the construction of a new one-story building at its plant on New York Avenue, in order to increase production.

**The Detroit Electrical Appliance Company**, 9124 Linwood Avenue, Detroit, which was recently incorporated to manufacture electrical equipment, will do its work under contract. Its own activities will consist in assembling the parts in its shop. D. H. Ladd is president of the company.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in South Africa (No. 5,890) for a small modern plant for the manufacture of paper bags for grocers, to be driven by electricity, and to include a suitable printing press and type for printing the bags.

Purchase is desired in China (No. 5,893) of clay mills capable of pulverizing clay into fine flourlike paste for pottery purposes, capacity to be about 2 tons of clay per forty-eight hours, to be operated by electricity.

Purchase is desired in Mexico of tire-inflation equipment, including a 200-lb. pressure air tank, 1-hp. electric motor and a two-cylinder pump.

An agency is desired in Punjab, India (No. 5,912), for electrical goods, motor accessories, etc.

Purchase or agency is desired in Mexico (No. 5,917) of electric flatirons, 110 volts, 6 lb., costing about $3; electric stoves with two or three hot plates, carrying about 1,000 watts, and similiar electrical apparatus of a cheap grade.

An agency is desired in China (No. 5,918) for motors and accessories to generate electricity for lighting ten towns in that country, capacity ranging from 11 kw. to 110 kw. Price lists, descriptive catalogs, etc., are requested.

The following inquiries have been received by the Philadelphia Commercial Museum, which will furnish names and addresses of the inquirers to any one desiring them and mentioning the number given: Parties in Paramaribo, Dutch Guiana (No. 40,579), would like to get in touch with manufacturers of electrical apparatus, electrical engines, automobiles and supplies, batteries, etc. Parties in Trinidad, British West Indies (No. 40,590), would like to correspond with manufacturers of optical supplies and also violet-ray and other high-frequency machines. A party in Stockholm, Sweden (No. 40,588), would like to communicate with manufacturers of advertising articles and electric or non-electric moving signs and apparatus for show windows.

HYDRO-ELECTRIC POWER FOR SAO SEBASTIAO, BRAZIL.—Under a contract recently made with a local company, according to *Commerce Reports*, hydro-electric power will be supplied for lighting and power purposes in the city of São Sebastião, State of São Paulo. Electricity for the neighboring port of Caraguatatuba is included in the agreement.

CALL FOR BIDS FOR A MUNICIPAL LIGHT AND POWER CONCESSION.—A municipality in the State of Rio Grande, Brazil, *Commerce Reports* states, is calling for bids on the franchise for supplying electricity for lamps and motors. The concession will be granted for thirty years, the municipality having the right to purchase the concessionaire's property at the end of fifteen years. Bidders must agree to the use of specific water power and to the supplying of service at 120 volts. They must also state the power and light rates, both to the municipality and to individuals, for the first ten years.

## New Apparatus and Publications

AUTOMATIC ELECTRIC LIGHT PLANT. —R. A. Lister & Company, Inc., 101 Park Avenue, New York City, has placed on the market an electric lighting plant that will start and shut itself off automatically.

INDICATOR LIGHT.—The H. T. S. Indicator Company, Chester, Pa., has brought out a device, known as "Lite-A-Meter," to protect the motor car from danger of overheating when the radiator indicator is not readily visible to the driver.

ETCHING OUTFIT.—The Union Electric Company, 933 Liberty Avenue, Pittsburgh, has placed on the market an outfit for etching ownership marks on lamps and other glass articles.

TOASTER AND GRILL.—The Chicago Flexible Shaft Company, 5560 Roosevelt Road, Chicago, has placed on the market the "Sunbeam" combined electric toaster and grill.

ELECTRIC CLOTHES DRIER.—An electric clothes drier has been developed by the Airo Electric Appliance Company, Columbia Bank Building, Pittsburgh, Pa.

POWER PLANT. — A light and power plant for portable and stationary work has been brought out by the Charles J. Bogue Electric Company, 513 West Twenty-ninth Street, New York City. The set can be operated in conjunction with storage battery if desired.

ELECTRIC RANGE.—A side-wall electric range has recently been placed on the market by the Standard Electric Stove Company, Toledo, Ohio.

WINDSHIELD CLEANER.—An electric windshield cleaner has been brought out by the Apco Manufacturing Company, Providence, R. I.

BELL STRIKER.—An electric bell striker for fire and danger signals has been placed on the market by the Electrical Automatic Appliance Company, 1749 Arapahoe Street, Denver, Col.

ELECTRIC STEAM VULCANIZER.—An electric steam vulcanizer which will repair two tubes at one time has been brought out by the Cross Vulcanizer Company, 1655 Blake Street, Denver, Col.

MULTI-SPEED MOTOR.—The Louis Allis Company, Milwaukee, has published a bulletin covering the "Watson" multi-speed motor. This motor is made in three types, two-speed, three-speed and four-speed, and is particularly adaptable to machine-shop requirements.

SOCKET.—The Tri Novelty Company, Wilson, Pa., is distributing a leaflet describing the "Neidig" drop socket.

## New Incorporations

THE ALMOND LIGHT & POWER COMPANY, Albemarle, N. C., has been chartered with a capital stock of $100,000 by Jethro Almond, J. T. and David P. Dellinger.

THE BLOWING ROCK (N. C.) LIGHT & POWER COMPANY has been incorporated with a capital stock of $125,000 by T. H. Coffee, D. A. Burkhart and W. L. Alexander.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

MACHIAS, ME.—The Eastern Development Company, a subsidiary of the Bangor Railway & Electric Company, contemplates building an addition to its local power plant.

MEREDITH, N. H.—The Meredith Electric Light Company expects to extend its transmission lines to Tuftonboro and Winona and to purchase energy from the hydro-electric plant of the Utilities Power Company. C. M. Turner is secretary and treasurer.

PORTSMOUTH, N. H.—The Rockingham County Light & Power Company contemplates increasing the output of its plant. F. W. Randall is assistant general manager.

WINDSOR, VT.—The Windsor Electric Light Company expects to install an additional 50-hp., 2,200-volt, three-phase motor, directly connected to a centrifugal pump for the municipal water supply. Richard P. Osgood is superintendent.

HUNTINGTON, MASS.—The Huntington Electric Light Company contemplates establishing a twenty-four-hour service. E. A. Stanton is treasurer.

NORWICH, CONN.—The Eastern Connecticut Power Company has issued $3,000,000 in bonds, part of the proceeds to be used for extensions.

## Middle Atlantic States

BROOKLYN, N. Y.—The Rubel Coal & Ice Corporation, 197 Glenmore Avenue, will install electric power equipment at its ice-manufacturing plant on Fulton Street, Hollis, to cost about $500,000. Edward Adelsohn, 1778 Pitkin Avenue, is architect.

COPENHAGEN, N. Y.—The Deer River Power Company contemplates building a new reservoir this year. V. C. Wood is manager.

FORT TOTTEN, N. Y.—Bids will be received by the Quartermaster Department, Torpedo Depot, until April 16, for 56,000 ft. submarine cable, nineteen-conductor, rubber-insulated, and fourteen cable reels.

LEICESTER, N. Y.—The Mount Morris Illuminating Company plans to extend its transmission line to Leicester and install a local light and power system.

MIDDLETOWN, N. Y. — The Orange County Public Service Corporation is building a new hydro-electric plant on Monagaup Falls of 5,000 hp., which will be placed in operation about May 1. The new 33,000-volt transmission line which will be connected with the line of the Honk Falls Power Company, Ellenville, will be completed about April 1. H. A. Farst is superintendent of electric stations.

MONROE, N. Y.—The erection of an interconnecting line with the Rockland Light & Power Company at Hillburn is under consideration by the Orange & Rockland Electric Company. R. W. Smith is president and manager.

WATERTOWN, N. Y.—The Power Corporation of New York contemplates building a hydro-electric plant on the Oswegatchie River, near South Edwards, to develop 10,000 hp. The cost is estimated at about $500,000. W. P. Creager, Northern New York Trust Company Building, is chief engineer.

WATERTOWN, N. Y.—Bids are being received by J. W. Ackerman, city manager, and P. B. Sutton, city engineer, for three 2,250-kw. generators, switchboard and transformer equipment for the new power plant at Delano Island. The cost is estimated at $75,000 to $100,000.

YONKERS, N. Y.—Electric power equipment will be installed by the Alexander Smith & Sons Carpet Company in connection with mill additions to cost about $1,000,000.

HIGHTSTOWN, N. J.—The Electric Light & Power Company of Hightstown plans to extend its rural line about 2 miles. Thomas J. Duncan is treasurer and superintendent.

NEWARK, N. J.—The Public Service Electric Company is planning to construct a power plant in the meadow section, to cost about $12,500,000. The station will be designed for an ultimate capacity of 160,000 kw. and will cost $25,000,000. Additional transmission lines for power service will be erected.

ALLENTOWN, PA. — Officials of the Pennsylvania Power & Light Company are organizing a number of subsidiary companies for the purpose of erecting transmission lines to various townships, with substations and distributing systems. Application for state charters will be made early in April. The companies will be known as the Dreher, Buck, Bear Creek, Lehigh, Salem, Denison, Paupack, Sterling and Palmyra Power & Light companies.

DOYLESTOWN, PA.—The Philadelphia Suburban Gas & Electric Company, Philadelphia, has acquired the property of the Bucks County Electric Company. A transmission line will be erected and the local power plant will be remodeled for a substation.

EAGLES MERE, PA.—The Eagles Mere Light Company will install two new waterwheels and governors within the next two months, to replace the present equipment, at a cost of about $11,000. R. D. Kehrer is general manager.

KANE, PA.—The American Water Works & Electric Company, New York, has issued $2,000,000 in capital stock, part of the proceeds to be used in connection with the acquisition of the Keystone Power Corporation, the Edison Electric Illuminating Company and the Cumberland Electric Railway Company and for proposed extensions and improvements.

MARCUS HOOK, PA.—The Viscose Company is planning to build a power house in connection with its proposed artificial silk mill, to be erected at Holmesburg Junction, to cost about $2,500,000.

MODENA, PA.—The Margargee Paper Company will build a power house in connection with a new mill at Edgeley, to cost about $500,000.

PHILADELPHIA, PA. — Electric power equipment will be installed in the proposed candy factory to be erected by the Brandle & Smith Company at Fifth and Bristol Streets, to cost about $360,000. The William Steele & Sons Company, Sixteenth and Arch Streets, is engineer.

YORK, PA.—The Pennsylvania Water & Power Company plans to erect a double-

circuit transmission line from Holtwood to supply energy to the Edison Light & Power Company. A substation will be erected at the city limits.

NEW CASTLE, DEL.—The Wilmington Fibre Specialty Company plans to install additional equipment in its power plant in connection with extension to its works, to cost about $250,000.

MIDDLEBOURNE, W. VA. — The West Virginia Light, Heat & Power Company plans to erect a transmission line from Sisterville to Middlebourne, and to install a local distributing system.

FORT EUSTIS, VA.—Bids will be received by the Quartermaster, United States Army, until April 10, for one electric watt-hour meter, 100 amp., and fifty electric watt-hour meters, 15 amp. (Circular 23-24).

WASHINGTON, D. C.—Bids will be received by the Chief Signal Officer, United States Army, until April 11, for ten mercury-arc rectifiers, 10 amp., for an eleven-cell storage battery (Proposal 14123-14 CP).

## North Central States

GRAND MARAIS, MICH.—The installation of new boilers in the Grand Marais light and water plant is under consideration. A. Newberg is chief engineer.

WAYLAND, MICH.—The M. & W. Light & Power Company is erecting a transmission line to the village of Hopkins, a distance of 4 miles, to furnish electrical service. A distribution system is also being built in the latter place. Clarence L. Miller is secretary and manager.

AKRON, OHIO. — The Northern Ohio Traction & Light Company contemplates the erection of a 132,000-volt steel-tower transmission line from Cleveland for the purchase of 25,000 kw. of energy, the construction of a downtown transformer and distribution substation, and the erection of a 22,000-volt transmission line to Wadsworth and Rittman. M. W. Arthur is commercial manager.

FULTONHAM, OHIO. — The Pittsburgh (Pa.) Plate Glass Company will build a power house in connection with its proposed local cement plant for the Columbia Chemical Division, to cost about $1,500,000.

CALHOUN, KY. — The Public Service Company contemplates installing a 75-hp. oil-engine-driven generating unit. C. G. Gilmore is proprietor.

HARDINSBURG, KY.—The Hardinsburg Electric Light Company is planning to erect about 20 miles of transmission lines to five towns and will install a street-lamp regulator of about 5 kw. or 6 kw. capacity and also twenty-five street lamps. R. R. Compton is secretary and manager.

KUTTAWA, KY. — The Public Service Company, Inc., contemplates installing another generating unit of the same capacity as the present unit. William Eades is manager.

MIDDLESBORO, KY. — The Kentucky Utilities Company plans to install electric power equipment in connection with extensions to the former plant of the Middlesboro Ice & Storage Company, recently acquired.

WALTON, KY.—The Dixie Light & Power Company contemplates the erection of 3½ miles of 2,300-volt transmission line. Royal A. Pickup is manager.

INDIANAPOLIS, IND.—Bids will be received by the Board of Trustees, Indiana University, Bloomington, until April 12 for equipment for the proposed power plant at the James Whitcomb Riley Memorial Hospital, including electric generators and engines, water-tube boilers, mechanical stokers, electric elevators and auxiliary machinery. Charles R. Ammerman, Occidental Building, Indianapolis, is consulting engineer.

LAFAYETTE, IND.—The Board of Trustees, Purdue University, plans to build a power plant, to cost about $250,000.

MARTINSVILLE, IND. — The Central Indiana Power Company has purchased the Martinsville Gas & Electric Company and will merge it with the Spencer (Ind.) Light, Power, Heat & Water Company and the Morgan County Light & Power Company, Gosport, recently acquired. Extensions and improvements will be made in the systems.

TIPTON, IND. — The Tipton Electric Light Company, recently organized to operate the municipal electric plant, contemplates purchasing electricity from the Northern Indiana Power Company within the next three months to operate the local system. Robert E. Staats is manager.

AUGUSTA, ILL. — The Central Illinois Public Service Company has secured a ten-year street-lighting contract and will make extensions and improvements in the system. A commercial system will be installed at Wenona, where a fifty-year franchise has been secured.

BELVIDERE, ILL.—The Illinois Northern Utilities Company has been awarded a ten-year street-lighting contract. Extensions will be made in the system, including the installation of new incandescent lamps to replace present arc lamps.

EAST ST. LOUIS, ILL.—The Murphysboro (Ill.) Brick Company plans to build a power house in connection with its proposed local plant, to cost about $200,000.

ASHLAND, WIS. — The Lake Superior District Power Company plans extensions to its system including the installation of additional equipment, to cost about $700,000.

EAGLE RIVER, WIS. — The Electric Light and Water Commission is planning to extend the transmission line to Three Lakes, Clearwater Lake and nearby resorts to furnish electrical service in those towns.

MADISON, WIS.—The Wisconsin Power, Light & Heat Company has appropriated $925,000, for extensions to its system.

MARSHFIELD, WIS.—The installation of new street lamps on about 2 miles of newly paved streets is contemplated this year.

MILWAUKEE, WIS. — Work will soon start on the erection of various buildings, etc., in Castalia Gardens, Milwaukee. The cost of this amusement resort is estimated at about $1,000,000, a large portion of which will be used for the installation of electrical equipment. Electricity for light and power purposes will be supplied by the Milwaukee Electric Railway & Light Company.

PORT WING, WIS.—Work, it is understood, will begin on the power dam at Orienta Falls for the North Wisconsin Hydro-Electric Power Company as soon as the weather will permit. The plans provide for a development of 500 hp. and the erection of a transmission line to Port Wing and to Herbster, Cornucopia and Bayfield. The erection of a transmission line to Iron River and later to Washburn is also under consideration. T. N. Okerstrom, Port Wing, is president.

RHINELANDER, WIS.—Plans are being prepared by Mead & Seastone, engineers, Journal Building, Madison, for an addition to the power house of the Rhinelander Light & Power Company, to cost about $40,000.

TOMAHAWK, WIS. — The Tomahawk Kraft Paper Company will soon being work on the erection of a new high-tension line from here to the site of the proposed hydro-electric plant at Grandmother Falls, 5 miles from here, to furnish energy for construction work. After the completion of the plant it will be used to transmit power from the hydro-electric station to the paper and pulp mill in Tomahawk.

BLUE EARTH, MINN.—The construction of a new boiler room and the installation of a new boiler of about 350 hp. at the municipal electric light and water plant is under consideration. A new well is now under way and a pump will be purchased. Don Fitch is superintendent.

CANBY, MINN.—The Union Public Service Company is planning to install two new steam-driven units of 900 hp. capacity, to run condensing with boilers, condensera, spraying pond, etc.; also the erection of 25 miles of new line for 38,000 volts, and rebuilding a 13,000-volt line for 38,000 volts for a distance of 40 miles. A. H. Savage is secretary and treasurer.

LITCHFIELD, MINN.—Improvements are contemplated to the municipal electric light plant, including the installation of a 500-kw. generating unit, a 300-hp. water-tube boiler, stokers, etc. J. C. Bang is superintendent.

GRUNDY CENTER, IOWA.—The Grundy Center Electric Company is installing a 225-hp. Diesel oil engine directly connected to a 200-kva. Western Electric generator. J. B. Calderwood is owner and manager.

KNOXVILLE, IOWA. — The Marion County Electric Company contemplates the erection of 11 miles of 22,000-volt transmission line. Herbert Bellamy is secretary and manager.

ODEBOLT, IOWA.—The Odebolt Electric Service Company is planning to change its system to four-wire, three-phase, 2,300 volts to neutral and 4,000 volts between phase conductors, and to serve all farm lines at 4,000 volts, single-phase. H. E. Russell is manager.

SIBLEY, IOWA.—Improvements are contemplated to the municipal electric light plant, including the installation of a 250-hp. Stirling boiler, with hand-operated stoker, coal and ash-handling equipment. The cost of the work is estimated at about $17,000. Joseph J. Shoemaker is superintendent.

PARK RIVER, N. D. — The Light and Water Department is considering rebuilding part of the electric distributing system and the installation of a 50-hp. engine. J. L. McGurre is superintendent.

KILGORE, NEB. — Arrangements are being made for the construction of a transmission line for local service.

LYONS, NEB.—The Electric Light Department is planning extensions of the electric lines (2 miles) to outlying districts, with transformers. A. W. Cass is superintendent.

DODGE CITY, KAN.—The installation of a 350-hp. boiler and accessories is under consideration by the Electric Service Company. Otto Theis is vice-president and manager.

LURAY, KAN.—The municipal distribution lines are being built and a power circuit added. H. M. Olson is city clerk.

McCRACKEN, KAN.—Plans are under consideration for rebuilding part of the municipal electrical distribution system for heavier duty. L. L. Ryan is city manager.

McCUNE, KAN.—An election will soon be held to submit the proposal to grant the Kansas Gas & Electric Company, Wichita, a thirty-five-year franchise. Under the terms of the proposed franchise the company will take over the municipal electric distributing system. C. F. Liebig is superintendent of the municipal light and water plant.

## Southern States

CONCORD, N. C.—The Hobarton Manufacturing Company contemplates the construction of a power house in connection with a local cotton mill, to cost about $400,000.

LAKEVIEW, N. C.—The Sandhill Power Company contemplates the construction of a hydro-electric plant, to supplement its present steam-operated station.

MARSHVILLE, N. C. — The Marshville Manufacturing Company will build a power plant in connection with its proposed local cotton mill, to cost about $115,000.

WHITAKERS, N. C.—Bids are being received by W. T. Hearne, superintendent of the municipal plant, for the erection of 5⅜ miles of electric transmission line.

DUNCAN, S. C.—Bids are being received by Lockwood, Greene & Company, Piedmont Building, Charlotte, N. C., for four-story cotton mill, 135 ft. x 300 ft., a five-story storehouse, 75 ft. x 100 ft., bleachery, power house, etc., and 300 houses for employees, for the Pacific Mills.

BIRMINGHAM, ALA.—Complete rehabilitation of the municipal electric light and water plants at North Birmingham, to cost about $60,000, has been decided upon by the City Commission. Meters will be installed throughout both the lighting and water systems.

BROCKWAYVILLE, ALA.—The Brockwayville Light, Heat & Power Company is planning to extend its transmission lines about 5½ miles to serve electricity in the rural districts. B. J. Morrison is treasurer and manager.

CRUGER, MISS.—Bids will be received by the city of Cruger for construction of an electric lighting plant, including equipment. The Kramer Engineering Company, Magnolia, is engineer.

PLAQUEMINE, LA.—Bids will be received by the Mayor and Board of Selectmen of Plaquemine until April 17 for improvements to the light and water plant as follows: For three crude-oil engines, directly connected to alternators, motor-driven centrifugal fire pumps, motor-driven domestic service pumps, motor-driven air compressors, switchboard, etc. Swanson-McGraw, Inc., United Fruit Building, New Orleans, is engineer.

PONCA CITY, OKLA.—A special election has been called to vote on the proposal to issue $80,000 in bonds for extensions to the municipal power plant. A. M. Stalnaker is city engineer.

BROWNWOOD, TEX. — The Helious Gasoline Company, Dallas, contemplates the construction of a power plant at its proposed gasoline works, to cost about $250,000.

HOUSTON, TEX.—Work will begin at once on the first unit of the new electric generating plant on the Ship Channel for the Houston Lighting & Power Company, to cost about $4,000,000. The equipment for the initial installation will include two turbo-generators of each 20,000 kw. capacity. The plans provide for an ultimate capacity of 160,000 kw.

LONGVIEW, TEX.—The Lacy Oak Flooring Company plans to build a power house in connection with its proposed hardwood mill, to cost about $150,000.

## Pacific and Mountain States

CHEHALIS, WASH.—The city of Chehalis has applied to the Supervisor of Hydraulics for permission to appropriate water from the Cowlitz River for power purposes. The cost of the proposed hydro-electric development is estimated at about $650,000.

LEAVENWORTH, WASH. — The construction of a power plant on Royal Mountain is under consideration by J. Naughton of the Royal Development Company.

TENINO, WASH. — The Puget Sound Light & Power Company will erect a transmission line from Olympia to connect with its Vancouver system.

PENDLETON, ORE.—Surveys are being made by the Pacific Power & Light Company for its proposed 66,000-volt transmission line from Pasco to Pendleton, via Umatilla. The cost is estimated at $300,000.

ROSEBURG, ORE.—Plans are under consideration by the Douglas County Light & Water Company to double the capacity of its electric plant at Winchester. The cost is estimated at about $200,000.

LOS ANGELES, CAL.—The Los Angeles Gas & Electric Company is planning extensions to its electric plant, including the installation of a 17,500 kw. turbo-generator and auxiliary equipment; 12,000 electric meters will be installed on consumers' premises, and transmission lines will be extended.

SAN JOSE, CAL.—The Guadalupe Lime & Cement Company, San Francisco, plans to install a power plant at its proposed local cement mill, the cost of which is estimated at $275,000.

SAN RAFAEL, CAL.—Steps are being taken for the installation of an ornamental lighting system on sixteen blocks in the business section.

SANTA ANA, CAL.—Bids will soon be asked for the installation of an ornamental lighting system on Fourth and Fifth Streets, consisting of eighty metal standards, to cost about $30,000. W. G. Knox is city engineer.

TAFT, CAL.—Bids will soon be called for the installation of an ornamental lighting system on Fourth and Fifth Streets, comprising fifty-four standards. Edward M. Lynch is city engineer.

VENICE, CAL.—The Southern California Edison Company will make extensions to its system in this district, to cost $400,000, including new transmission lines.

VISALIA, CAL.—Steps have been taken by the Chamber of Commerce for the installation of an ornamental lighting system in the business section.

YREKA, CAL. — The California-Oregon Power Company will rebuild its transmission line from Fall Creek to Yreka. The voltage of the line from Fall Creek to Montague will be increased from 34,000 to 60,000 volts.

CALHAN, COL.—At an election to be held May 3 the proposal to install a municipal lighting system will be submitted to the voters.

DENVER, COL.—A proposal to install a new fire-alarm system, to cost about $200,000 will be submitted to the voters at the coming election.

CARLSBAD, N. M.—The Public Utilities Company will install a new 300-hp. vertical water turbine and a 210-kva., three-phase, 2,300-volt alternator this summer. A new 170-kva., directly connected alternator will be put on oil engine. A new telephone switchboard, new lines, etc., are contemplated for telephone system, and some improvements will be made to the water system. E. A. Roberts is manager.

## Canada

ROSSLAND, B. C.—The West Kootenay Power & Light Company, Ltd., has petitioned the Provincial Department of Lands for permission to double the output of its main power plant at Bonnington Falls on the Kootenay River.

TORONTO, ONT. — The Bell Telephone Company contemplates improvements in the Hudson exchange district, including wire, cable and underground conduit work, to cost about $255,000.

RIMOUSKI, QUE.—Plans are being prepared by the Lower St. Lawrence Power for a water-power development on the Metic River. The generating station will be built at Princeville and a transmission line erected from Matane to Princeville, a distance of 80 miles. Bids, it is understood, will be asked in May.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued March 13, 1923)

1,448,381. CONTROL SYSTEM; E. M. Bouton, East Pittsburgh. App. filed May 12, 1919. Control apparatus for reversing motors.

1,448,382. MOTOR-CONTROL SYSTEM; E. M. Bouton, East Pittsburgh, Pa. App. filed Dec. 14, 1920. Thermal control system for starting motors.

1,448,388. ELECTRIC FURNACE RESISTOR; O. A. Colby, Irwin, Pa. App. filed June 3, 1921. Combined granular and solid resistor.

1,448,389. ELECTRIC PERCOLATOR; O. A. Colby, Irwin, Pa. App. filed April 18, 1922. Two-shell receptacle.

1,448,398. RESISTOR FOR LIGHTNING ARRESTERS; L. R. Golladay, Wilkinsburg, Pa. App. filed May 10, 1922. Several discharge gaps with liquid resistance connected between gaps and ground.

1,448,402. MEASURING SYSTEM; S. Q. Hayes, Pittsburgh, Pa. App. filed June 5, 1916. Totalizing wattmeter.

1,448,403. COIL SUPPORT; S. C. Hoey, Wilkinsburg, Pa. App. filed Sept. 19, 1919. Supporting structures for field-magnet coils.

1,448,405. ELECTRICAL SYSTEM; G. W. Huey, Wilkinsburg, Pa. App. filed March 9, 1917. Phase-reversal protection for three-phase motors.

1,448,408. DUPLEX CARRIER-WAVE SYSTEM; J. S. Jammer, New York, N. Y. App. filed Jan. 21, 1920. Applied to carrier-current telephone systems.

1,448,409. FREQUENCY REGULATOR SYSTEM; C. H. Kidl, Pittsburgh, Pa. App. filed March 31, 1920. For governing the speeds of prime movers.

1,448,410. REGENERATION OF SINGLE-PHASE MOTORS; J. M. Labberton, Wilkinsburg, Pa. App. filed Sept. 13, 1919. Regulation of alternating-current commutator motors during regenerative periods.

1,448,413. ELECTRODE; F. J. Metzger, New York, N. Y. App. filed July 29, 1920. For luminescent lamp bulbs.

1,448,419. FLASH GUARD FOR DYNAMO-ELECTRIC MACHINES; M. W. Smith, Wilkinsburg, Pa. App. filed May 14, 1920.

1,448,420. TELEPHONE-EXCHANGE SYSTEM; P. C. Smith, Worcester, Mass. App. filed Sept. 30, 1919. Automatic or mechanically controlled switching devices.

1,448,437. TROLLEY-WIRE HOLDER; M. L. Dunlap, Philipsburg, Pa. App. filed Oct. 14, 1922. U piece around wire clamps onto ear.

1,448,474. TROLLEY HARP; L. Vollmuth, Chicago, Ill. App. filed Nov. 25, 1921. Device to prevent pole from leaving wire.

1,448,484. GENERATOR AND BATTERY CONTROL; G. Fornaca, Turin, Italy. App. filed Jan. 12, 1920. Automatic battery-charging system.

1,448,510. APPARATUS FOR ELECTRICAL HEATING OF FLUIDS; P. A. E. Armstrong, Loudonville, N. Y. App. filed April 16, 1921. Non-rusting element immersed in fluid.

1,448,511. BRUSH FOR ELECTRICAL MACHINERY AND METHOD OF MAKING SAME; O. E. Becker, Oak Park, Ill. App. filed June 4, 1919. Gage brush.

1,448,523. TELEPHONE-EXCHANGE SYSTEM; R. D. Conway, Chatham, N. J. App. filed Oct. 23, 1918. Signaling means for telephone switchboards with co-operating circuits for extending incoming circuits.

1,448,540. APPARATUS FOR MEASURING GAS PRESSURES; W. G. Housekeeper, Philadelphia, Pa. App. filed July 14, 1917. For evacuated tubes or lamps.

1,448,542. PROCESS OF MANUFACTURING LOADING COILS; B. H. Jackson, New York, N. Y. App. filed March 20, 1920. Method of manufacturing cores for inductance coils for telephone lines.

1,448,550. THERMIONIC AMPLIFIER CIRCUITS; H. D. Arnold, Maplewood, N. J. App. filed Feb. 3, 1919. Vacuum discharge repeater for telephone lines.

1,448,553. TELEPHONE-PLUG SHELF; F. F. Lucas, East Orange, N. J. App. filed April 24, 1920. For telephone manual switchboards.

1,448,559. ELECTRICAL PROTECTIVE DEVICE; D. T. May, New York, N. Y. App. filed Dec. 6, 1920. Communication-wire lightning arrester utilizing carbon gap.

1,448,563. MOTOR CONTROL; N. L. Mortensen, Milwaukee, Wis. App. filed June 12, 1920. Provides for uniform lowering speed of cranes.

1,448,566. WIRE FABRIC MANUFACTURE; O. Muller, Jr., Brooklyn, N. Y. App. filed Sept. 20, 1919. Manufacture of wire-mesh grids for vacuum tubes.

1,448,572. TELEPHONE SYSTEM; L. Polinkowsky, Antwerp, Belgium. App. filed April 29, 1920. Machine-switching apparatus utilized for setting up connections.

1,448,575. WAVE METER AND SIMILAR ELECTRICAL DEVICE; G. H. Stevenson, Rye, N. Y. App. filed Dec. 21, 1920. Frequency calibration of meter not affected by opening or closing circuit.

1,448,576. TELEPHONE-EXCHANGE SYSTEM; W. B. Strickler, East Orange, N. J. App. filed March 19, 1921. Establishing connections between extension lines of private branch exchange.

1,448,578. RESISTANCE ELEMENT; A. R. Swoboda, Newark, N. J. App. filed March 10, 1922. Coreless winding of insulated wire formed into an elongated unit.

1,448,583; DIRECT-CURRENT TRANSFORMER; H. J. Van der Bijl, New York, N. Y. App. filed May 8, 1916. By means of thermionic tubes and induction coil.

1,448,586. PROCESS OF MANUFACTURING ALUMINOUS ABRASIVES; T. B. Allen, Hamilton, Ont., Canada. App. filed April 22, 1922. By smelting with powdered coke and a metal.

1,448,604. COLUMN STRAIN INSULATOR; L. Steinberger, Brooklyn, N. Y. App. filed Dec. 6, 1918. Guy-wire insulators.

1,448,621. PIPE-OPERATING DEVICE; G. A. Fletcher, Brazil, Ind. App. filed July 26, 1920. Service pipes laid in ground by drilling hole.

1,448,676. RECEIVER; E. Reisz, Zehlendorf-Mitte, Germany. App filed May 25, 1921. Adaptable to loud-speaking telephones.

1,448,681. ELECTRICAL RESISTANCE; E. R. Stoekle, Milwaukee, Wis. App. filed Sept. 11, 1922. Grid leak for the vacuum tubes.

1,448,700. LIQUID-COOLED ELECTRIC MACHINE; M. Seidner, Budapest, Hungary. App. filed March 18, 1919. Liquid-tight channels in both stator and rotor.

1,448,702. TRANSLATING CIRCUITS; J. R. Carson, Montclair, N. J. App. filed July 10, 1920. Modulator arrangement to vacuum-tube sending or receiving apparatus.

(Issued March 20, 1923)

1,448,749. ELECTRICAL SYSTEM FOR AUTOMOBILES; C. F. Kettering, Dayton, Ohio. App. filed April 6, 1918. "Delco" system with 110-volt generator.

1,448,750. TELEGRAPH PRINTER; E. E. Kleinschmidt, Brooklyn, N. Y. App. filed April 14, 1916. Direct method of selecting and operating type bars of the printer.

1,448,773. TRANSMISSION-LINE INSULATOR; F. W. Springer, Minneapolis, Minn. App. filed March 7, 1919. Protecting insulation from abnormal voltages by arcing gaps.

1,448,792. METHOD OF MAKING MASTER PHONOGRAPH RECORDS; W. H. Cole, Newark, N. J. App. filed Aug. 10, 1921. Metal deposited by precipitation from solution distributed upon the wax record.

1,448,815. SELF-WINDING CLOCK; F. J. Reilly, New York, N. Y. App. filed Feb. 27, 1920. Electrically operated primary movement.

1,448,816. SECONDARY CLOCK; F. J. Reilly, New York, N. Y. App. filed Feb. 27, 1920. Secondary clock wherein hands are gravity operated.

1,448,824. TELEGRAPH REPEATER; R. C. Blakeslee, Milwaukee, Wis. App. filed Dec. 20, 1920.

1,448,902. MEANS FOR REGULATING THE SPEED OF ELECTRIC MOTORS; W. Schäffer, Berlin, Germany. App. filed May 3, 1922. Motors for radio sending apparatus.

1,448,923. ELECTROLYTIC PROCESS; F. N. Flynn, East Orange, N. J. App. filed Oct. 29, 1919. Reduction of lead sulphate to lead.

1,448,949. ELECTRIC LAMP STAND; R. J. Travers, San Diego, Cal. App. filed May 13, 1921. Table lamp made from telephone stand.

1,449,004. JEWELER'S PLATING MACHINE; F. A. Howe and S. W. Howe, Spencer, Iowa. App. filed Sept. 11, 1922.

1,449,008. ELECTRODE FOR ELECTROLIZING FUSED MATERIALS; T. Kolkin, Vadheim, Sogn, Norway. App. filed June 27, 1921. Support for diaphragm between electrodes.

1,449,022. BRAIN TELEPHONE; W. B. Vanderlip and C. H. Viggars, Los Angeles, Calif. App. filed Dec. 21, 1921. Translation of sound vibrations to the brain without intervention of ear.

1,449,070. SIGNALING DEVICE FOR VEHICLES; W. E. Spangler, Arlington, Va. App. filed Jan. 25, 1918. Direction signal.

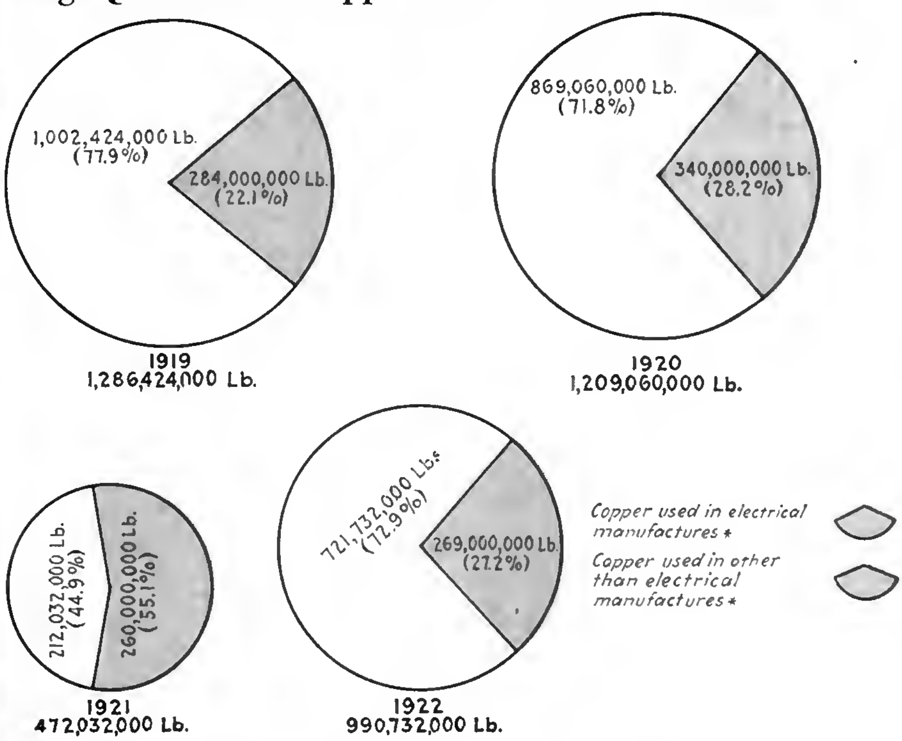
1,449,094. ELECTRIC IRON PROCESS; Albert E. Greene, Seattle, Wash. App. filed May 3, 1916. Deoxidizing process carried on in electric furnace.

1,449,148. DETECTOR FOR WIRELESS-TELEPHONE OUTFITS; W. F. Gehrig, Newark, N. J. App. filed March 9, 1922. Crystal detector holder and contact.

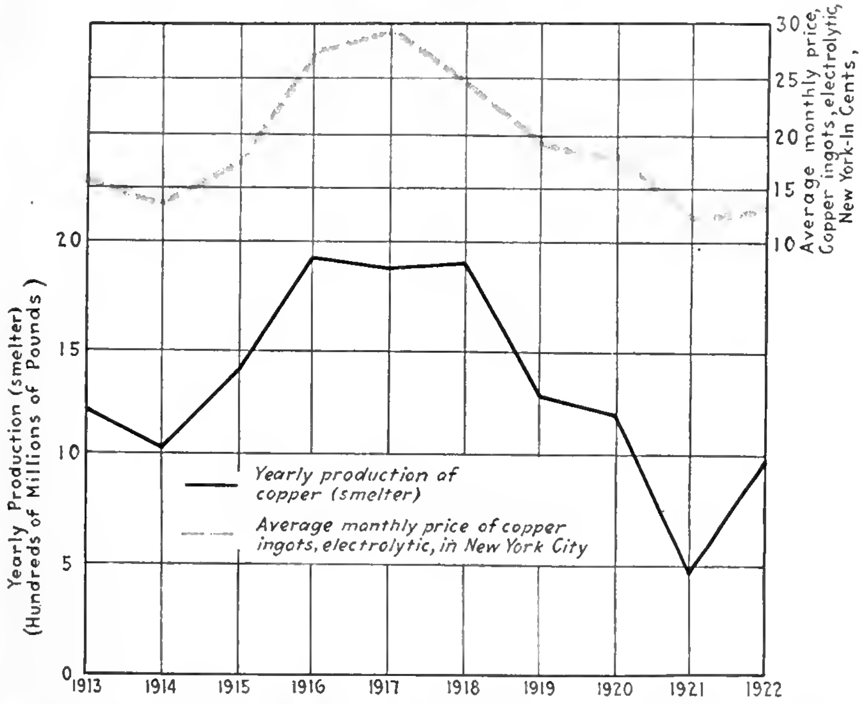
# Business Facts for Electrical Men

Selected Statistics Presented Graphically for the Use of All Interested in Analyzing the Trend of the Electrical Business

## Large Quantities of Copper Used in Electrical Manufactures



## Production and Prices of Copper Follow Same General Trend



*"Electrical manufactures" includes electrical machinery, apparatus, accessories, etc, but not conductors.

## The Place of Copper in the Electrical Industry

IN A LARGE way the story of copper during the past century and a quarter is the story of the development of the electrical industry. At the beginning of the nineteenth century Volta, Watt, Maxwell, Faraday, Siemens and many other scientists were engaged upon a series of researches on electrical phenomena that was only of academic importance. Their practical application was soon perceived by such men as Morse, Bell, Edison, Brush, and in the latter half of the nineteenth century the telegraph, telephone, generator, motor, the incandescent lamp, and the installation of transmission and distribution systems had opened up a vast field in the usefulness of copper. At present copper holds undisputed sway in the electrical field.

The accompanying diagrams which are based on data furnished by the American Bureau of Metal Statistics indicate the large percentage of copper production which ultimately finds its way into the manufacture of electrical machinery, apparatus, accessories, etc., but these data do not include conductors. If wire is included and also the brass used in electrical manufacturing it is probable that beween 60 and 70 per cent of the total copper produced is at present used by the electrical industry, and in a much higher percentage during the industrial depression of 1921.

The price of copper has followed closely the general trend in copper production. During the war period the use of copper was tremendously increased due largely to its use in the manufacture of war materials, and the price rose with this increased market, the peak being reached in 1917. After this peak had been reached the average monthly price gradually returned to pre-war levels, reaching the low point in August, 1921. The present price is about 45 per cent above the low mark, and it is believed that still higher prices will come before the present boom is ended.

Most of the data for statistics in the ELECTRICAL WORLD are gathered by it from original sources. Privilege is freely given to readers of the ELECTRICAL WORLD to quote or use these statistics for any legitimate purpose. While there is no requirement that the source of data be given, yet it would help the ELECTRICAL WORLD in obtaining and compiling further basic information if those using these statistics would credit the ELECTRICAL WORLD.

## Record Projected New Construction During March

MARCH witnessed the largest volume of projected new construction ever reported in the United States for any single month. The *Engineering News-Record* figures indicate that the new construction projected during March was almost 9 per cent over that of March last year. And this in the face of an increase in construction cost of almost 32 per cent during the 12-month period. It would appear, therefore, that the often expressed fear that a large portion of the projected construction would be held up on account of high prices is unfounded. New construction is so imperative this year that it is being undertaken in spite of costs which under ordinary conditions would serve to materially retard such activities. All of which has an optimistic bearing on the electrical industry, both in the future sale of electrical energy and the installation of electric apparatus and supplies. It begins to look as if the generating, manufacturing and merchandising activities of the electrical industry will exceed even the most optimistic prophecies made at the opening of the year.

# Loyalty Must Be Mutual

IN A CERTAIN city is a central-station operating organization headed by an executive whose vision extends far beyond the balance sheet and into the hearts and feelings of his fellow-workers. The activities of the "family" are led by an employees' club in which all employees meet on a common ground. It is managed solely by employees. Except for the times when he is called on to introduce a speaker in the periodical meetings or take some part that reveals his position, a casual stranger would find it impossible to pick "the boss" out of the happy, jolly crowd that gathers several hundred strong. Down through the entire force is a feeling of loyalty, a sense that "we are doing the job" developed to an unusual degree, which is clearly reflected in company relations with the community. The club work is simply a sign of the spirit that prevails from "the boss" down.

In another organization is a temporary utility construction crew, gathered together, as such organizations are, from casual labor available in the territory. With a record of 2 per cent a month in labor turnover, the entire working crew is found pulling enthusiastically to get the job done at the least cost, the various camp crews vying with each other in doing their best. A crew that meets with misfortune and falls behind is the subject of good-natured "ragging" that leads it to redouble its efforts to regain the lost ground. Every man knows how the job is progressing, knows what it is costing, and is taking a keen interest. Despite the higher wages, work is being done at a unit labor cost that is far under pre-war costs and in some cases almost unbelievably low.

WHY such results? Because in each case a man with real vision and the keenest of human sympathy is in charge. His forces are working with and not for him. Regardless of the disagreeable things that must be faced, the organizations know that "the boss" is looking out for their interests just as much as for those of the stockholders, and they also realize that he knows the value of the investment in the human material that makes up the organization and is as loyal to the men as he expects them to be to him.

The results in dollars and cents on the balance sheet in each case are results that no hard-boiled dollar-chasing policy can possibly achieve. The secret lies in the sturdy honesty, character, good sense and the broad human sympathy of the man at the top. His courage in acting in accord with these qualities is one of the fundamental reasons for a success that needs emulation in far too many organizations.

# Frank William Peek, Jr.

*A brilliant research engineer and formulator of the basic laws of corona.*

THE electrical industry has been singularly fortunate in solving the technical problems that it has encountered in its progress and development. When progress is blocked by a technical obstacle there always come to the rescue the technical and research engineers who have been active in developing the industry along sound scientific lines. No industry in history has so closely followed a theoretical and technical program of development.

Frank William Peek, Jr., is a fine example of the modern technical engineer. His enthusiastic and rigid researches in the field of transmission and dielectric phenomena are typical of those of a band of engineers who devote their lives to research and invention. In 1910 Mr. Peek was engaged in the study of the problems of 250-kv. transmission. More than ten years in advance of commercial 220-kv. transmission, Mr. Peek built a high-voltage line, established and put in form for practical application the laws of corona, pointed out the necessity for grading line insulators and made other researches covering the control, protection and regulation of high-tension lines.

In the field of transients and dielectric phenomena Mr. Peek has created a position for himself second to none. His research papers on oil and air dielectric phenomena, transients, corona, insulation and lightning protection are studied and admired by all engineers and have been translated into foreign languages. His book on "Dielectric Phenomena in High-Voltage Engineering" is a standard reference and text book in technical schools.

Mr. Peek is a native of California and was born in Mokelumne Hill, Aug. 20, 1884. He is a graduate of Leland Stanford, Jr., University of the year 1905 and received his master's degree from Union in 1911. He became connected with the General Electric Company in 1905 and took the test course and then spent two years in the power and mining department. In 1909, upon its formation, he joined the staff of the consulting engineering department.

The A. I. E. E. has always been cordially supported by Mr. Peek, who has been chairman of its electrophysics committee for several years and is besides a member of other committees. He is also a member of the American Physical Society and other bodies. His calm judgment and winning personality have resulted in a host of friends who predict for him a still more brilliant future in his researches for developing the art of transmission.

# Editorial Comment

Electrical World, April 14, 1923

Volume 81 Number 15

### A Pregnant Source of Public Good Will

NEW sources or methods of contact with the public are always attractive to the industry, but good ideas are unfortunately somewhat rare. One such idea is embodied in a book issued last fall by the Smithsonian Institution—a work of art which possesses large possibilities in the education of the rising generation to an appreciation of the tasks and problems of the electric light and power industry. Much of the misunderstanding between the public and industry in general is due to ignorance of the functionings of industry, and not to any inherent enmity between the two. One cure lies in the proper instruction of grammar-school and high-school students in the operations of the various industries of the country, and this is exactly what this Smithsonian Institution publication aims to do.

The book is an unusually elaborate diagrammatic and pictorial study of the natural resources of Pennsylvania, based on the latest government data and designed for use in the public schools of the Keystone State. Each industry of the state is thoroughly covered both in text and illustration. The generation, transmission and distribution of electrical energy are explained in a clear and concise manner, the text being augmented by maps and a pictorial diagram of a complete generating and distributing system. Every advanced student in the State of Pennsylvania will study this book, and none can help being impressed by the intricate functionings of the electric light and power industry. Such instruction should make the pupil a better citizen as well as more sympathetic with the problems of the local distributing company. "Where there is no vision the people perish."

Pennsylvania is to be congratulated on this decided advance in public school instruction, and the central stations of that state will profit materially because of it. The Smithsonian Institution is desirous of doing the same work for the other states of the Union, and the state electrical associations would do well to help make this wish an actuality.

### The Farmer Not a Radical

THAT the Middle Western farmer has turned from radical ideas acquired temporarily as a result of his severe post-war deflation troubles is the conclusion of competent observers. This has a direct meaning for utility men. Under the stress of deflation conditions the farmer as a political force struck blindly at a great many things that were apparently causes of his troubles. The elections last fall, especially in the Middle West, put into office many irresponsibles who may be expected to espouse all sorts of radical regulation or municipal ownership proposals. But the swing of the farmer back to his normal conservative mental state is already being made evident in the withdrawal of support of radical proposals made by these men who were put into office by the agricultural vote.

Utility interests faced by radical movements while legislatures were in session in the Middle West found it good policy to steer a clear course that would keep the conservative elements of the agricultural group with them. For the sake of their public relations, utility men need to avoid being stampeded by some unbalanced radical who breaks loose with wild proposals. It is worth while to keep close to the sober thinking people of the community and retain their confidence.

### Equipment Betterments and the Executive

EXECUTIVE approval is necessary in such a large proportion of engineering betterment undertakings that it behooves operating men to make a special study of how to present such propositions to their superiors. Many a desirable improvement in plant has been flatly refused because of inadequate data, insufficient explanation or too confident an assumption that once the estimated economic justification was shown to the men "higher up" a favorable decision would follow as a matter of course.

Industrial-plant motive-power superintendents, electrical engineers and other technical staff members may be satisfied in their own minds that it will pay rich returns to install new equipment in particular cases, but such convictions are often inadequate to carry the appropriation to victory. Thus the proposal may arise to equip thirty industrial electric trucks with ampere-hour meters or to install watt-hour meters in factory departments and sub-departments. The busy executive listens to the proposal and multiplies the cost per truck or per meter by the total number involved—result, a sum perhaps not large in itself, but one that looks to the hard-headed executive like a target worth demolishing. He advances the opinion that the money had better be saved or expended in some other way, and the cause is lost for the time being unless the technical staff can summon reserves enough to break the line of opposition.

These reserves include specific information upon equipment performance under present conditions, reduced when possible to unit figures; a willingness to take a slice of bread when even half a loaf cannot be had, via the route of making piecemeal installations of economical devices; concise knowledge of results of using similar equipment elsewhere, adequate service record provisions, and an intimate understanding of the viewpoint and mental habits of the court of appeal.

Nothing can take the place of detailed knowledge on the part of the electrical engineer or motive-power man of the reasons why this or that piece of apparatus accumulated a good or bad reputation for service in the plant cost-accounting system. Maintenance costs on a particular truck, for instance, may be extraordinarily low during a certain period and catch the

executive eye. Incorrect deductions may result unless the reason be made clear; for example, that the equipment was held for painting and was out of service during a certain time. The present lack in many industrial plants of anything like adequate record systems of equipment performance badly hampers the engineer who attempts to convince his constitutionally and professionally skeptical superior that savings will be effected by the introduction of betterments. The older the plant, the more fertile should be the field for economic achievements by these means, and even in new plants it is sound policy to keep the door ajar when improvements come a-knocking.

## Facts Concerning Electric Trucks Too Long Ignored

In a recent address before the New York Electrical League R. C. Boyer pointed to some interesting figures of the New York Port Authority. According to these, 25 per cent of the trucks in New York are gasoline-driven, 2 per cent are electric and 73 per cent are still horse-drawn! The gasoline trucks are for the most part probably well fitted to the longer hauls—the wise man will not knowingly spend 6 cents per minute for a gasoline truck to stand or crawl in New York's slow-moving traffic on short-haul work. But in replacement of the 73 per cent of horse-drawn vehicles the electric truck should find an opportunity. Similar, though probably not so striking, conditions exist in other cities.

That the truck manufacturers are commencing to appreciate the situation is shown by the noticeable intensifying of their advertising (and, by the way, their factories have been much busier in the past two months). They have employed much newspaper space to point out that of every dollar received from sales of merchandise from 18 to 25 cents is spent for delivery by gasoline or horse; for laundry deliveries, 20 to 30 cents; for bakery goods, 18 to 25 cents; for ice cream, 20 to 30 cents, and for milk, 25 cents. Electric trucks, they say, can handle city deliveries faster than the gasoline car in city traffic, with the inherently easier starting, and they operate at a cost 20 to 35 per cent less and last longer.

These facts are worth pondering over a bit. Apparently too few central-station executives have ever really stopped to study them and picture what they might mean in dollars saved in the delivery of goods in their own cities. An opportunity to cut delivery costs 20 to 35 per cent where at present the expense runs 18 to 30 cents on every dollar taken in is something on which no man who has goods to deliver will turn his back. The trouble has been that he has not known that the electric truck could do so much for him. The central-station man has not known it either. They have both been told, but neither has paid attention and realized what the figures mean.

But here are facts that demand recognition. The electric truck is shown to offer a fundamental economy in a large field of urban distribution. There is a demand, if not a clamor, for reduced distribution costs in cities, and conditions could hardly be more favorable than they are right now for instilling the idea of electric trucks for city deliveries. The first step everywhere is for the central-station man to learn and believe these facts. Then let him go to work with the truck manufacturer to demonstrate them to every man in his town who uses trucks and to see that servicing facilities are established. From this will some day grow the substantial vehicle load that all men know will ultimately come, to the real profit of the electrical industry.

## Handling Service Applications Promptly

Recent observation of the time lag between a number of applications for central-station service and the introduction of energy into the new customers' establishments raises the query whether utilities of this class are doing all that they can do to expedite such procedure. The larger the company, the more of a problem it becomes to avoid delays in furnishing service, and frequently these delays are due to conditions outside company control. None the less when complaints that there is a gap between promise and performance become frequent it is time to look sharply into the cause.

What the Syracuse Lighting Company has accomplished in reducing the elapsed time between the signing of the application for service and the execution of the order to less than three hours is a fine example of what can be done to cut red tape and eliminate lost motion. At no increase in cost over the former method, the company is rendering a high grade of service that has produced the most tangible of results in making friends of its customers. The methods employed by the Syracuse company merit serious consideration by every central-station man who is interested in winning the good will of the public.

The whole subject of furnishing service and its routine is a large one. It is out of the question to suggest in a few paragraphs detailed solutions of a problem which has interested central-station managers for decades, and yet the need of applying efficiency engineering to this branch of company business is far from imaginary. Viewing the matter broadly, the public policy of providing service to applicants is the most important phase of the question. There have lately been some very discouraging reports on service delays after approved applications have been set in motion departmentally. Promises to give service by particular dates have not been kept; agreements as to installation costs of reaching residences from street mains have been too informal, sometimes on mere scraps of paper, and in some cases the calling of official attention to unwarranted delays in putting service into operation has had scant result. In other cases certain standardized average costs of reaching the consumer have been applied, with the result that the consumer has gone ahead and done the work himself at lower outlay and with a correspondingly poor opinion of the utility's regulations and charges.

In countless thousands of cases central-station companies are doing all that is possible to render prompt service to applicants, and in many other instances good reasons can be adduced for apparent failure to furnish service on expected dates. To call attention to the fact that too many cases have come to the front of late where popular good will has been jeopardized through delays in the installation of service is but to urge that utility executives check up their practices in this respect and ascertain whether departmental red tape is not here and there strangling accomplishment and hampering the development of friendship with new customers. A

policy of indifference in this matter is a dangerous game to play, for the public is going to have the service it demands, and if company managements do not meet the need, this branch of public relations will be taken out of their hands.

## Boiler-Room Practice of Tomorrow

WHEN the development and perfection of a type of equipment or system of operation becomes complete, the electrical industry is particularly addicted to finding another type of equipment or system of operation that promises better performance or is better adapted to its needs. When the steam engine reached a remarkable state of perfection the turbine came into being; when the direct-current system became satisfactory the alternating-current system was developed into a commercial possibility. In each case the replacement of the old by the new worked out to the ultimate advantage of the industry.

Are we now witnessing the same kind of revolutionary changes in boiler-room practice? Recurrent news of pulverized-fuel stations, thousand-pound boiler pressures, separately fired superheaters, preheaters, new designs of feed-water systems and operation at temperatures over 700 degrees cannot fail to impress central-station engineers and executives. Such changes are radical and yet they seem to develop overnight from theoretical dreams into practical installations. The light and power industry is especially daring in its engineering work because the prize to be obtained through increased efficiency in operation is so great. On the larger systems a gain of even 1 per cent in efficiency can be capitalized for a substantial sum, and every inducement is offered for trying out new equipment and practices which promise better and more economical service. Yet the widespread adoption of pulverized fuel, high pressures and high temperatures for the new power stations, although based broadly on sound engineering, affords food for thought and presents opportunity for many complications.

No question exists as to the splendid efficiency and better adaptability of boilers fired by pulverized fuel, but some pretty weighty problems are still to be solved before standard or satisfactory practice is to be attained. In the very large boilers contemplated the stack effect of the long flame, the effect of the high temperature on refractories and tubes, the proper baffling to insure most efficient heat absorption and many details of fuel handling, crushing and firing are difficult to determine by paper design. Yet the development of the practice has proceeded to such an extent that courageous engineers do not falter in the face of these comparatively minor details but render their decision on the basis of the big possibilities for more economical and convenient operation. There is no reason to doubt that the minor troubles which occur will be solved by the engineers.

Operation at high temperature is accompanied inherently by more difficult problems. It reduces to a question of materials and in its theoretical aspects invades the realm of metallurgy. Valves, valve stems, pipe and pipe fittings to operate at 800 degrees or even higher have yet to be developed, and indications point to an extensive use of alloys or very high-grade steel. Much experimenting and research must be done on materials and much better design will be necessary to secure successful operation. Even the turbine must be redesigned and perhaps rebuilt to operate under the contemplated pressures and temperatures.

Yet these radical changes in boiler-room practice have advanced to a stage where nearly 750,000 kva. in new station capacity is being installed along lines embodying the new features. The next two years will see station after station starting operations using powdered fuel, high pressures and high temperatures. Never was there a greater degree of combination and readjustment in boiler-room practice or more opportunity for initiative and sound engineering. Such moves make the light and power industry advance still more rapidly on its conquering career.

## Opportunity to Increase Switch Ratings by Minor Modifications

THOUGH no very definite information has been released by electrical manufacturers who have co-operated with operating companies in the testing of old and standard-type circuit breakers during the last few years, the statement is generally gaining credence that the rupturing capacity of some of the old circuit breakers can be increased considerably by relatively simple modifications and without great expense. This does not mean that any operating company can expect to handle greatly increased short-circuit currents merely by modifying old circuit breakers. It does mean that if the rupturing duties have not increased very much, the switches can possibly be strengthened by consulting the manufacturer and purchasing replacement parts. In cases where even the modified breakers will not be adequate for increased short-circuit duty in their existing positions they may be moved to positions of less severe duty and can be expected to perform better than the unmodified breakers.

In general the changes involve one or several of the following modifications: Increasing head of oil over the contacts; provision of explosion chambers; installation of combined gas vents and oil-separating chambers; stronger tank covers and tie rods, and improved contacts. No one switch is likely to require all of the foregoing modifications. In some cases round tanks are preferred to other shapes, static shields must be removed from terminals, contact terminals must be braced, or stuffing boxes must be provided around the operating rod.

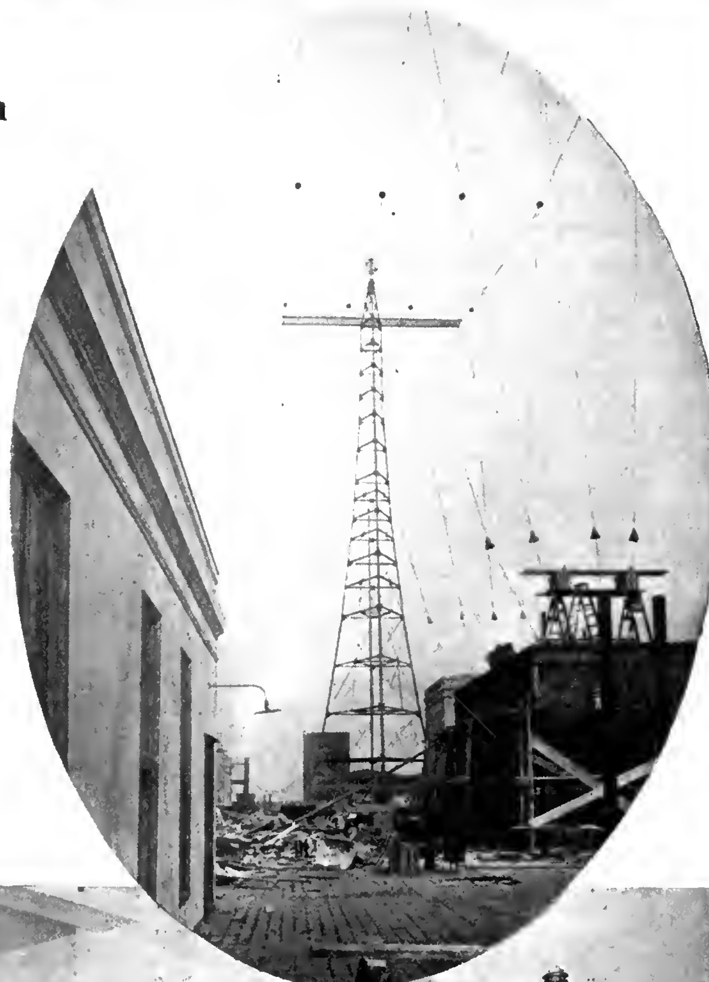
Some companies are going ahead with modifications of the character outlined, utilizing the old equipment almost entirely but adapting it to the replacement parts. Where greater oil heads are required, an extension is being welded on the top of the tank and new insulating linings are being inserted.

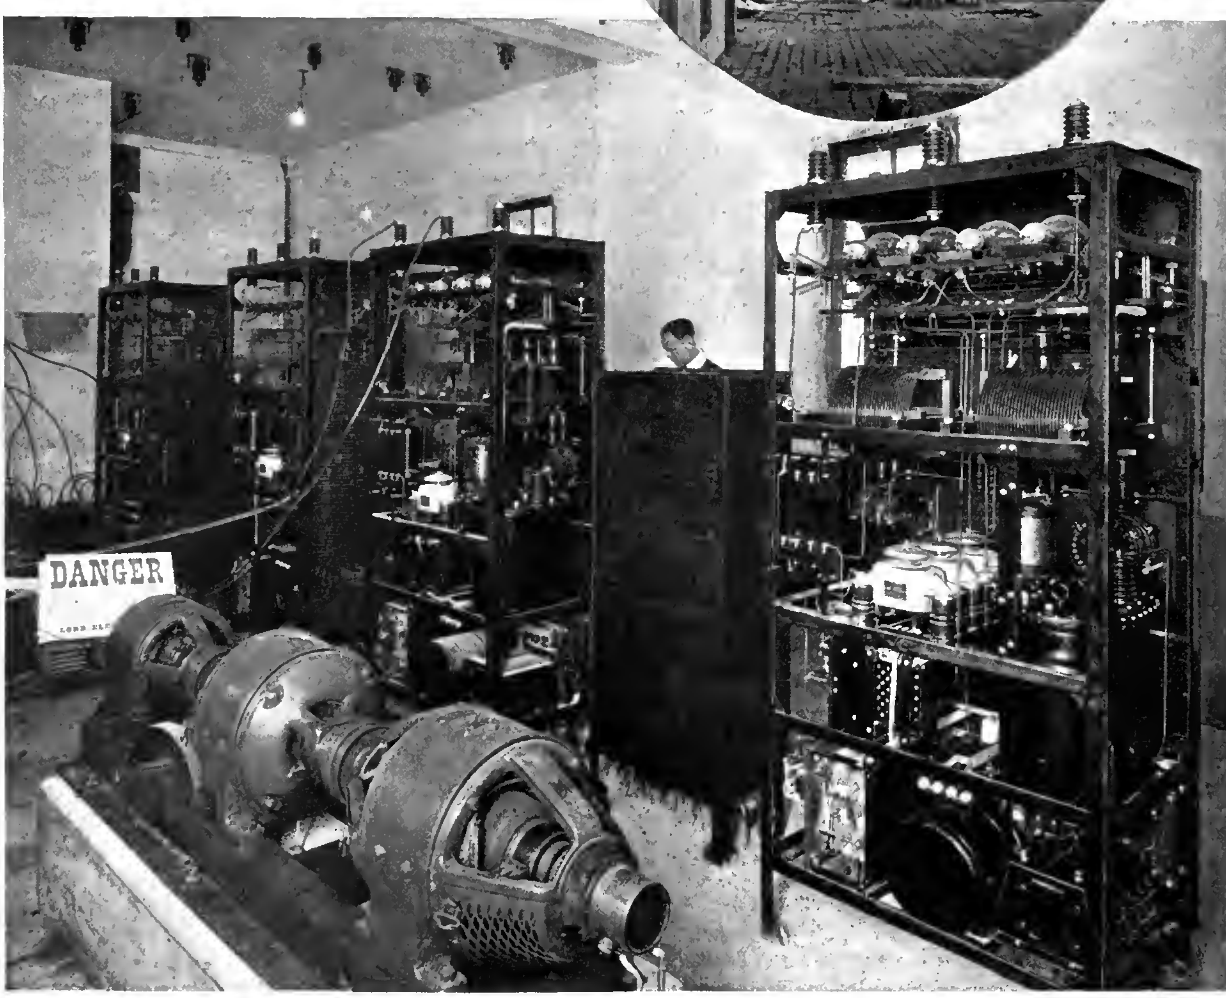
According to the co-operative tests conducted on the modified breakers the expense of making the changes is fully justified by the improved performance of the breakers and the resulting increase in service reliability.

To a limited extent manufacturers are now carrying on this modification for customers where a situation is really pressing. But most manufacturers are heavily loaded with orders for equipment sorely needed for extensions and it would not be to the general interest to add to their burdens unnecessarily. Where immediate relief is urgently needed with existing equipment, users are advised to consult the manufacturers who made the particular switches in question for details as to what to do.

# New Broadcasting System to Transmit Two Programs Simultaneously

ANTENNAS and broadcasting equipment capable of transmitting two different programs simultaneously are being installed on the Aeolian Building, New York City, by the Radio Corporation of America. The antenna consists of two separate groups of wires which are connected to two independent transmitting sets operating at different wave lengths. The station will probably be in operation early in June.





# Complete Million-Volt Laboratory—Part II

## Auxiliary Equipment Consists of a Sphere Gap, Crest Voltmeter and Control Transformers and Resistors—An Adequate Oil System Is Necessary—Specially Designed Rectifier Is Used

By J. F. PETERS and D. F. MINER
*Engineering Department, Westinghouse Electric & Manufacturing Company*

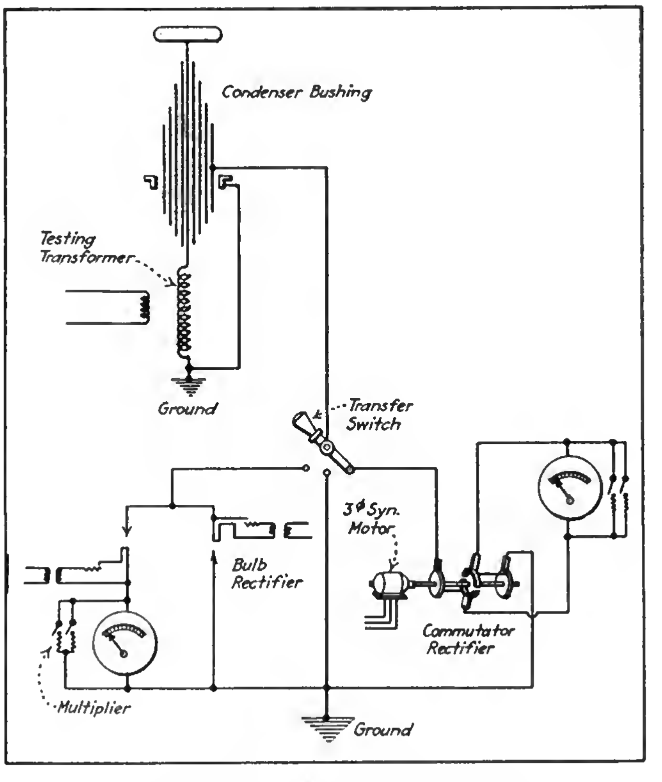
IN ADDITION to the transformer equipment for supplying high voltage, a complete laboratory must have auxiliary apparatus for control and measurement purposes. This equipment is usually specially designed and must be very reliable and accurate as its functioning is absolutely essential to securing correct data. One of the most important high-voltage devices is the sphere gap, and the 100-cm. gap is one of the assets of the laboratory.

Following the pioneer investigations of Fortescue and Farnsworth of the Westinghouse company in 1913, the sphere spark gap was adopted by the American Institute of Electrical Engineers as a secondary standard of high-voltage measurement. An air gap between two metal spheres breaks down and allows a spark to pass at a surprisingly uniform voltage. A definite relation, only slightly affected by atmosphere changes, exists between the size of spheres, separation and voltage necessary to start an arc. No other form of spark gap can be relied upon to such a degree of accuracy. Meters used for indicating high voltages must be standardized by comparison to a sphere gap. In order to insure greatest reliability the sphere gap should not be used at separations greater than the sphere diameter. This limits the accurate range of any diameter of spheres and necessitates the use of several sizes of sphere gaps, each suitable for a limited voltage range. When the million-volt transformer equipment was designed no existing sphere gap was suitable for measurement of such potentials. Consequently a 100-cm. sphere gap was included in the plans.

Each ball was cast of special bronze and carefully turned to 100 cm. diameter (39.37 in.). After turning, micrometer measurements of several diameters were made daily for a long period and slight changes were found to occur, due to release of internal strains. When these movements had ceased the spheres were trimmed in the machine to insure perfect spherical shape. When finished each ball weighed 400 lb., with a wall ⅜ in. thick.

In mounting this gap one sphere was placed on the end of a micarta tube attached to the top of the condenser-bushing static shield. The other was suspended vertically over it on an insulating shaft terminating in a metal rack. A motor operated from the switch room is geared to this rack and raises or lowers the upper sphere at the will of the operator. A counter weight is provided to balance the sphere, so that the motor can control the movement sensitively. The separation of the spheres is read on a vertical scale with a pointer attached, through multiplying pulleys, to the upper end of the sphere shaft. Zero setting is accomplished electrically. When the upper sphere is run down until it touches the lower sphere enough to change the downward pull on the shaft, an automatic device operates a limit switch, stopping and braking the motor instantly.

A resistance rack is installed to limit the gap discharge to full-load current (1 amp.). This consists of a group of carbon rods mounted on an insulating frame hung from the roof truss and connected at one end to the upper sphere and at the other to ground. The spark then jumps the gap, travels to the resistances, thence to ground. Above the upper sphere a grounded metal surface was built to preserve a uniform field.

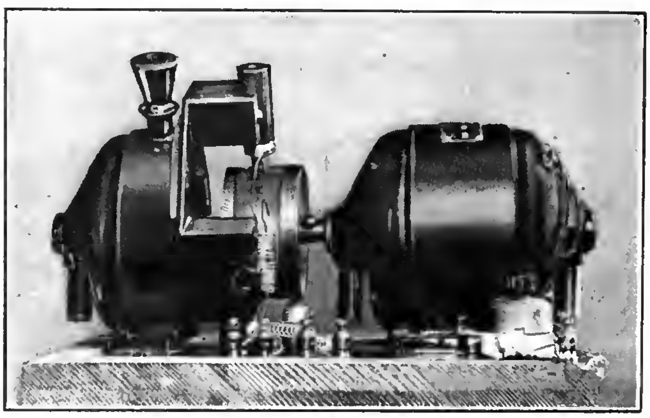


CONNECTIONS FOR CREST VOLTMETER

Starting with the incoming lines at 22,000 volts, power is controlled by an electrically operated automatic circuit breaker in the substation and connected to a 1,000-kva. tapped supply transformer. From this point there are two systems by which the voltage supply to the million-volt transformer may be controlled. With good conditions on the power line a 35-kva. step-induction regulator is used, directly connected by a remote-control circuit breaker between the taps of the supply transformer and the primary of the testing transformer. This regulator consists of a motor-operated induction regulator provided with a drum above with connections to the transformer taps. The regulator raises or lowers voltage between taps, and when the limit is reached connections are automatically switched to the next set of tap connections. By this arrangement a very uniform and consistent rise of primary voltage from zero to 5,000 volts is obtained.

For accurate testing, or when circuit disturbances are present in the main supply, a motor-generator set is used. This is connected through circuit breakers to the supply transformer secondary, using this winding as an auto-transformer to supply the induction regulator, with the primary (22,000-volt side) disconnected. Generator field control, motor-operated, may also be used if desired. The generator is a special 600-kva. unit, 5,000 volts, single-phase, 60 cycles, designed for good wave form at low power factor. It is directly connected to an 800-hp., 2,200-volt, three-phase, 900-r.p.m. synchronous motor, driven from the central-station supply. A 23-kw., 250-volt exciter is also provided.

A grid resistance insulated for 5,000 volts is arranged to be shunted across the circuit breaker which connects the regulator to the supply transformer. This is used for sustained flashovers. After breakdown has occurred this circuit breaker is opened automatically and the resistance inserted, cutting down the primary voltage and limiting the current. The circuit is finally cleared when desired by tripping the substation breaker.



VIEW OF COMMUTATOR RECTIFIER

Control of the various auxiliary apparatus is installed in the operating booth, which is so placed that the test floor is in view. Within easy reach of the operator are the substation breaker control, the regulator control, spark-gap control, generator circuit-breaker control and generator field control. In addition to the manual switches and buttons, a foot switch was installed upon which the operator stands. Release of pressure on this button disconnects the power at the substation.

### Crest Voltmeter Used to Measure Voltages

It is essential that the greatest possible accuracy be obtained in indications of voltage on testing transformers. Experimental data are frequently relied upon to furnish information for design of a complete line of equipment. If the test results are in error, disastrous failures may occur and expensive changes become necessary. As the test voltages employed have risen in advance of commercial practice in the last few years, the importance of reliable high-potential measurements has brought improvements of interest.

As a measuring instrument the sphere gap has some disadvantages. It is not an indicating instrument but a limit measure. Measuring voltage by a spark gap is like measuring steam pressure with a nicely adjusted safety valve. Whenever a reading of changing voltages is desired, or if it is required that a certain test voltage be applied to some apparatus, another form of instrument calibrated by comparison with the sphere gap must be used.

For relatively low voltages (up to 50,000) a voltmeter reading the primary voltage of the transformer may be relied upon to indicate the secondary or high voltage, using a multiplying factor of the ratio of secondary to primary turns. If the transformer is well designed, with closely coupled windings and low leakage reactance, this method is sufficiently accurate for all testing purposes.

Above 50,000 volts two factors enter to destroy the accuracy of the turns-ratio method. First, insulation requirements involve greater spacing between primary and secondary coils and thus greater distance of secondary from the core. The entire magnetic flux then does not link all coils, and the primary voltage necessary to establish the leakage flux in addition to the useful flux does not bear a true ratio to secondary voltage. Furthermore, the error is not constant but increases with voltage. The second factor is that of capacity reactance. In transformers built for the higher test voltages (300,000 and upward) the construction is often such that there is considerable capacitance between coils and between coils and case. In the million-volt transformer and several 500,000-volt units recently constructed by the Westinghouse Electric & Manufacturing Company a new design was used, employing nested concentric tubes with single-layer coils wound on them. The construction resembles the form of a condenser bushing. This gives a very high capacitance, which is of value in distributing internal stresses between windings. However, it also produces a secondary voltage higher than the turns ratio would warrant. In other words, it has a positive regulation which increases up to about 25 per cent at full voltage. The million-volt transformer primary is designed for 5,000 volts, or a 200 to 1 ratio, but application of slightly more than 4,000 volts will produce a million volts on the secondary, a ratio of 250 to 1.

Two methods of indicating voltage in the case of extremely high-voltage testing transformers are in use. One is by what is called a voltmeter coil. A specially designed and placed small coil is built into the transformer and corrected for errors by compensation. The voltmeter then reads the secondary voltage quite well under proper conditions. It will read effective value, however, no matter what the wave shape. Distorted wave shape may be present owing to source of supply or to character of the load.

In most testing work we are interested not in the effective value of the wave but in the peak. The highest voltage reached during the cycle is the value to which the apparatus is subjected and which will cause failure. For this reason the sphere spark gap is an excellent standard. It is, in effect, a standard piece of insulation (an air path in a uniform electrostatic field) which will fail in a manner similar to the apparatus to be tested, and its breakdown is determined by the crest value. Usually the calibration curve of a sphere gap is, however, marked in values of the equivalent sine wave effective voltage ($E_{max.}/1.41$).

The other method is the crest voltmeter, developed by L. W. Chubb of the Westinghouse company. It can be demonstrated mathematically and experimentally that the average value of the charging current to an electrostatic condenser is proportional to the peak of the applied voltage wave. An average-value reading instrument and a condenser connected to the voltage to be

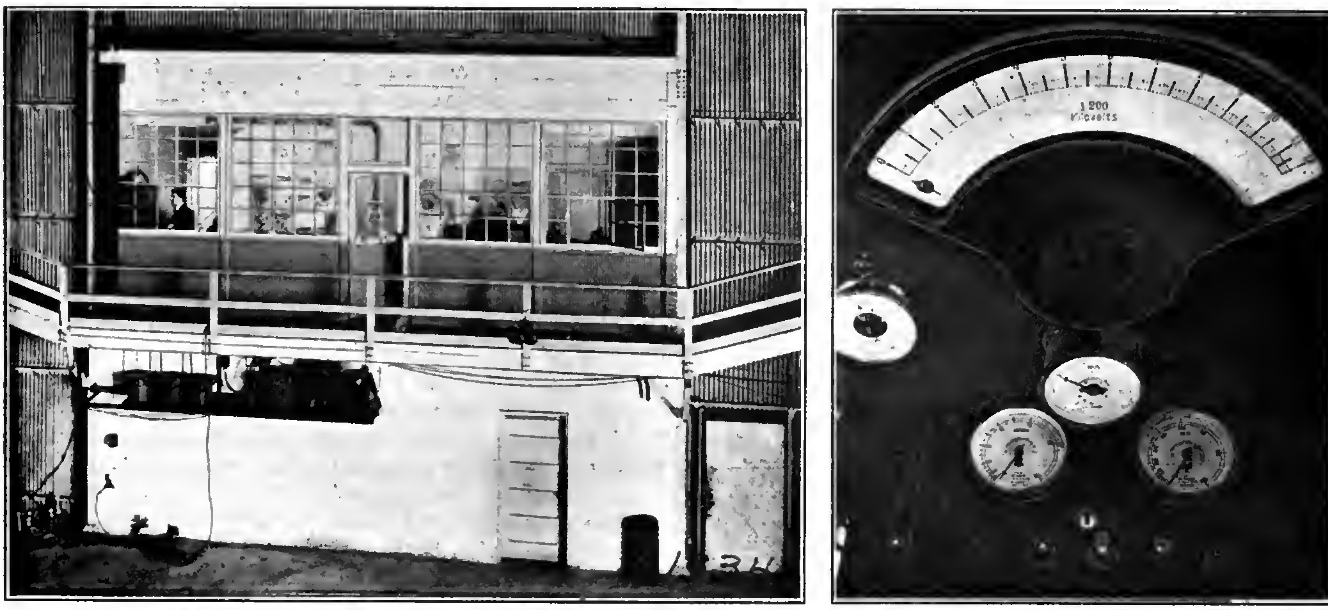
measured are therefore needed. The charging current to the condenser bushing of the transformer is rectified and passed through a D'Arsonval type of direct-current meter, connected at the ground potential end. The meter can be calibrated directly with uniform scale in secondary volts or kilovolts.

For several years the rectifiers used in crest voltmeters have been of the bulb type, using a hot cathode in a mercury vapor. With such distortions of wave shape that the bushing charging current (differential of voltage wave) crosses zero more than twice per cycle, the bulb rectifiers are inaccurate, for they entirely suppress the negative loops instead of adding them algebraically. While harmonics do not usually occur in such values as to cause this excessive distortion, certain combinations of testing conditions have been experienced where this does occur, especially at the extremely high voltages in use.

To provide for such conditions an additional system of double mechanical rectification with separate meters After this adjustment is once made it rarely needs to be touched.

The indicating meters are made sensitive enough so that they are normally shunted when used for highest voltages. This permits the use of switches increasing by steps the resistance of the shunt for various ranges or cutting out the shunt altogether for low readings. This means of making a multi-range instrument is very flexible and may be modified to suit conditions. Usually two or three fixed ranges are sufficient. The scale of the larger of the two meters (used with mechanical rectification) is divided into twelve major divisions and 120 minor divisions. The best arrangement of shunts found for this million-volt set was full-scale reading of 1,200,000 volts and 600,000 volts, giving the easily used multiplying factors of 100,000 and 50,000. The smaller meter, used with the bulbs, contains 100 minor divisions and similar factors may be used.

The operator in his booth is usually occupied with several duties—control of the various switches and gen-



VIEW OF CONTROL ROOM, AUXILIARY EQUIPMENT AND CONTROL PANEL

was installed. The duplicate system has the added advantage of a spare in case of damage to either set of instruments or circuits. A ratio voltmeter is also available and can be calibrated against the crest voltmeter for approximate indications in case of failure of both other instruments. On the panel a convenient transfer switch is used to connect in the bulb rectifier system, the mechanical rectifier, or to short-circuit and ground all meters.

The mechanical rectifier was built by mounting a special commutator on an extension of the shaft of a three-phase, four-pole, ¾-hp. synchronous motor connected to the same supply as the transformer. The commutator consists of a brass cylinder mounted on an insulating core. Four brushes bear on this ring—two for the alternating current coming from the condenser bushing and two carrying the rectified current to the meter. The cylinder is so slotted that each meter brush is alternately connected to the two alternate-current brush segments, the reversal taking place at the zero point of the wave. A lever on the brush rigging allows the brushes to be shifted relative to the motor frame so that the point of maximum rectification can be found.

eral observation of events out on the test floor. Consequently it is desirable to have the meter scales as long as possible and clearly marked so that readings may be accurately taken without loss of time or distraction of attention from other events. The meter elements must also be dead-beat, yet not overdamped, a requirement hard to meet when the needle is long and travels over quite a distance.

This crest-voltmeter installation has proved to be entirely satisfactory as to accuracy and convenience, and the principle, devised long before the present high voltages were available, solves problems of more exacting requirements than were originally anticipated.

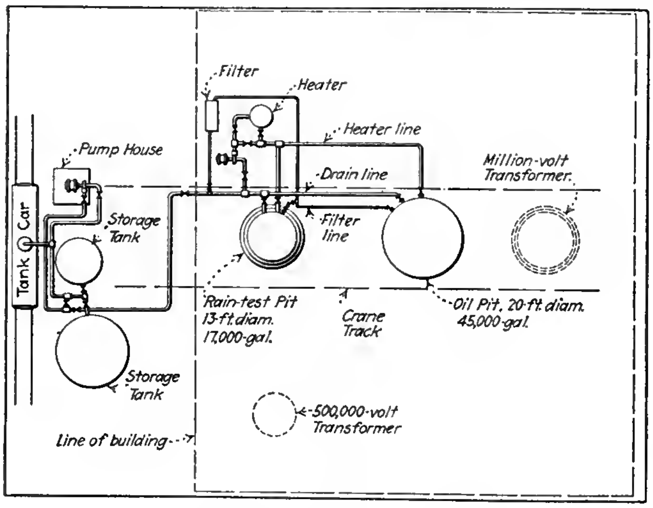
The second testing transformer is similar in construction and is equipped with auxiliaries similar to those of the million-volt transformer. The tank, provided with an internal barrier, is 9 ft. in diameter by 10½ ft. high. A similar cover with a projecting lip for shielding was used and nothing projects above the surface except the bushing. On top of the condenser bushing, which is 12½ ft. long and 21½ in. in diameter at the flange, rests the upper static shield 5 ft. in diameter and 10 in. thick. A reactance coil for protec-

tion is wound on a micarta tube attached to the top of this "hat" and terminates in a connector.

The capacities of the supply transformer (500 kva.), the generator equipment (300 kva.) and the testing transformer (500 kva.) are just one-half those of the corresponding equipment for the million-volt set. For uniformity in installation and repair the circuit breakers and regulator, however, were made identical with the larger outfit.

In the control room an operating booth for the 500,000-volt transformer was installed with similar switching control and metering arrangements, except that no spark-gap control was needed. In place of the stationary 100-cm. sphere gap a portable 50-cm. gap is used with this transformer. For lower-voltage tests a 25-cm. gap is available.

The two testing transformers may be used simultaneously for different work without interference if desired. With the two transformers on the same supply phase,



LAYOUT OF OIL PIPING SYSTEM

1,500,000 volts difference of potential is obtained between the two transformer terminals with ground potential one-third of the total from one side. Another connection useful with three-phase transmission-line work may be used. The transformers may be switched to different phases to obtain a phase angle of 120 deg. between the high potential windings.

Most of our stationary types of electrical apparatus—transformers, circuit breakers and electrolytic lightning arresters—use a petroleum-base oil for insulating purposes and as a medium for conducting internal heat from the electrical parts to the outside. In order to utilize these two valuable characteristics of transformer oil to best advantage, careful design studies must be conducted. The combination of solid insulating members with oil involves consideration of the relative specific inductive capacities, the internal losses and other factors. Furthermore, corona under oil may present serious problems, and research must be undertaken to determine the best forms of conducting members adjacent to insulation. The characteristics of solid insulation change with temperature, so that engineers must have data at oil temperatures similar to those reached under heavy load on apparatus. For these reasons extensive facilities have been provided for oil tests.

A steel tank, 20 ft. in diameter and 20 ft. deep, holding over 45,000 gal. of oil, was installed. Placed in this tank is a large wooden frame, 14 ft. x 14 ft. x 16 ft., with adjustable cross-members for supporting any apparatus or model under test. If desired, the frame may be raised from the tank and changes or adjustments made at a convenient location.

Another tank, 13 ft. in diameter and 18 ft. high, in a concrete pit, is used for bushing tests. The cover of this tank is fitted with flanged plates to accommodate various sizes. The lower end of the bushing is immersed in the oil, and the upper may be kept in dry air during test or a heavy spray may be directed against outdoor types. The water runs off the cover and is drained out of the concrete pit.

An extensive piping system is required to handle the large volume of oil (60,000 gal.) in these test tanks. When hot oil is desired in either or both, a centrifugal pump of 500 gal. per minute rating is started to circulate the oil through a heater. Cold oil is drawn from the bottom, passed through the heater and delivered to the top of the tank. The discharge pipe is built in sections, so that the hot oil may be delivered just below any desired oil level to prevent foaming. The heater tank, 5 ft. in diameter by 8 ft. in height, contains grids arranged for several connections and capable of dissipating a maximum of 500 kw. A separate substation circuit breaker and supply transformer are installed for this equipment. Even with this rate of heat supply to the oil, approximately ten hours is necessary to heat the oil in the larger tank from 10 deg. C. to 70 deg. C.

After continued use, especially at high temperatures, the oil deteriorates, but filtering will remove the impurities and moisture, making the oil good again. A large filter press of 30 gal. per minute capacity is used for this purpose and may be connected to either tank by opening proper valves.

An adequate storage system becomes necessary with these test tanks by means of which oil may be drained from the tanks for inspection, repair or changes. A reserve oil supply and means of segregating special oil or bad oil is also desirable at times. For these purposes two storage tanks were constructed outside the laboratory. They are so located, with necessary pump and piping, that new oil may be easily taken from a tank car on the railroad side. An unusually flexible piping arrangement in connection with the storage tanks allows the following operations: (a) Pumping oil from tank car to either or both test pits; (b) pumping oil from tank car to either storage tank; (c) pumping oil from either or both storage tanks to either or both test pits; (d) draining oil from either or both test pits to either or both storage tanks.

Both test tanks are provided with piping attached to a 500-gal. "Foamite" chemical engine. In case of fire the opening of a valve permits mixing of the chemicals and a blanketing of the oil surface with a foam which smothers the flame.

### Layout of Substation and Grounds

Power from the transmission system of the Duquesne Light Company is delivered to the laboratory at 22,000 volts, three-phase, 60 cycles. This power, through disconnecting switches and automatic circuit breakers, is supplied to the separate transformers installed for the larger power-consuming equipment. Each test transformer and the oil heater have separate supply units. The low voltage of the testing transformer supply units is arranged with several taps, with a maximum of 5,000

volts. The heater circuit is 2,200 volts. In addition, a three-phase, 1,000-kva. bank, 22,000 volts to 2,200 volts, is provided for auxiliaries, such as crane, lighting, motors, etc. The total connected load of the substation is 3,000 kva.

Adjacent to the laboratory, which is on a hill, there is over an acre of level ground intended for outdoor testing. Life tests and weathering studies are set up here and leads connected to the testing transformers through the 60-ft. x 45-ft. doors. There is unusual opportunity for transmission-line investigation in this location along a right of way through relatively unimproved property leading from the laboratory for over a mile. Beyond this another long stretch is available with only slight contact with civilization.

In high-voltage research photographic instruments for recording phenomena both visible and invisible to the eye are of great aid. The high-voltage laboratory has a complete portable oscillograph with accessories with which valuable data have already been obtained on testing-transformer transient characteristics. Recently great importance has been attached to high-speed photography for studying the progressive changes in insulator flashovers under various conditions. For this purpose a special high-speed camera, designed by the designer of the portable oscillograph,* J. W. Legg, has been provided.† This camera is capable of taking exposures at a rate up to 3,000 per second. Besides these instruments, a camera for ordinary photographic work is used. Dark-room facilities are provided in the control building.

# The Home Office Visits the Local Plant

## A Bit of Satire Pointing Out the Hurt and Harm that This Can Do, Whereas the Situation Offers a Great Opportunity

By WARREN R. VOORHIS
*Vice-President American Water Works & Electric Company, New York City*

IN THIS day of holding companies of large business interests and utilities, a semi-oversight and management of the various branches is usually maintained at what is known as "the Home Office." This necessitates the visit of officers, auditors and inspectors from time to time to the branch offices, and it is to these "visitations" that the following article applies.

### HE SEES THE PLANT

The doorway of the "local plant office" is darkened.

It is the representative of the home office.

He is about to visit the local plant.

The flustered cashier rejoices in the safety of his cage; the girl at the adding machine misses her decimal point; the typists pound furiously on the keys; the plant manager scrambles into his coat and puts his monthly report to the home office on his desk where it can be seen of all men; the dog of the repair man crawls under the service truck and regards the universe with a gloomy and an apprehensive eye.

The representative and the manager shake hands, and there are a few minutes of that most acute of all the forms of social torture—polite conversation; late trains, poor hotels, mean weather, warm and pleasant in New York, and so on.

Together they climb into the company car and drive out to see the plant.

The representative expects to find something wrong at the plant.

It was built by human hands; it has since been run by human intelligence; there always is something wrong at the plant.

Really the place looks clean, trim and well kept. It is in a good state of operating efficiency. But the manager is paid for this service; obviously there is no occasion for approving comment.

The manager points out, with a gleam of enthusiasm, one or two little recent improvements which he thinks will make for economy.

The representative regards them and inquires whether the manager first submitted these innovations to the home office.

If the manager says he did, the representative gives his benediction.

If the manager says he did not, the representative permits his silence to register grieved reproof.

The representative finds something wrong. He explains how it got wrong, what will happen if it is not fixed, and he gives the most minute and explicit orders about it. The manager murmurs his understanding and assent.

It is difficult to regard the timely visit of the representative at this crisis of the plant's life other than as providential.

The representative and the manager lunch together at the hotel.

This is apt to be a dull business.

The representative, with the broad outlook of the suburban commuter—his wide world vision gained in Pullman smokers and second-class hotel lobbies, naturally enough finds it difficult to adjust himself to the conversational plane of the manager, who gets his viewpoint from newspapers and books and Chamber of Commerce luncheons and loafing at odd times with the local editors, bankers and lawyers.

So there is more polite conversation at this luncheon.

### HE SEES THE BOOKS

In the afternoon the representative goes into the office and looks into the books—any book will do to look at.

The cashier wonders how long the bond company will give him to fix it if anything is wrong.

Every little girl remembers every error she has made since she went to work for the company.

Probably the books are all right; still more probably the representative would not know if they were wrong.

But this is not the point.

He has scared the everlasting daylights out of the whole office, which is the one impressive feature of this kind of a visitation.

There is more polite conversation with the manager.

The representative explains that the home office is getting out a new set of forms—they will be twice as long and so arranged as to provide a permanent tomb for twice the present amount of useless information.

The clouds break. The representative asks for a timetable showing the next train and one hundred dollars expense money. Willing hands assist him.

The manager drives the representative to the station and tries to find where he is going in order to send a wire of warning.

Back at the office the cashier greets the patrons with a smile and looks forward to a few more years of association with his family, the little girls salvage their gum from under their desks, the manager hangs his coat on its nail and goes to work, and the dog of the repair man resumes his benevolent watch over the yard and bites his fleas in the sun.

The visitation is over.

The voice of authority has been heard. Discipline has been maintained.

### He Sees the Help

To all young gentlemen who regard this general type of visitation with approbation I should like to suggest certain refinements of technic, the effect of which can reasonably be expected to improve this form of visitation.

For example, when the representative finds something wrong at the plant, instead of confining his criticism and giving his orders to the ear of the manager alone, let him call in the chief engineer and two or three workmen and then give his views and orders in the form of a lecture or discourse. The effect of this should be to emphasize the fact that, while the manager is in nominal charge, the real brains of the business is, of course, in the home office.

My suggestion upon this point should be especially helpful to the manager.

And as soon as the representative gets back to the office he should dictate to the manager's stenographer a letter to the home office.

He should report the crisis which he found at the plant.

He should inform the home office, however, that there is no cause for alarm: "Explicit orders have been given by *me* for its correction."

A copy, of course, to the manager.

### He Sees the Public

Another suggestion: It should be desirable and useful for the representative of the home office to know the men of standing and consequence in the community where the plant operates.

He should call upon them, and of course he should go alone, leaving the manager at the office. In his conversations with these gentlemen, being a man of tact, as are all representatives of the home office, he will say no word in any way derogatory of the manager.

The representative should merely create the impression that while the manager is really a very honest, worthy person, well able to operate the physical property, naturally in the higher realm of public relations and affairs the home office expects its representatives to establish and maintain that contact.

Upon his return to the office the representative should write a second report to the home office—this time in longhand; and since the matter is outside the scope of the manager's duties, there is no occasion to give him a copy of this letter or tell him about the various conversations.

Another good way to impress the manager with the co-operative spirit of the home office is in the matter of the adjustment of grievances.

If some consumer has a quarrel over the service of the company, let the representative go alone to the aggrieved consumer and patch up the quarrel. It does not matter how it is settled—probably best by letting the consumer have his way. The important object is to let the consumer know that he can always get justice by going over the head of the manager to the wise, strong, able home office.

Upon returning to the office the representative should say to the manager that the matter is adjusted and that he will receive a letter from the home office stating the terms of settlement, under File 16-21208.

And so on.

### The Opportunity

The man who goes out from the home office to visit the local plant has a fine opportunity.

He can make his visit so helpful, so friendly, sc sympathetic and so useful that the local manager and all his force will welcome his coming and will want him to stay as long as he can.

He can be a source of inspiration; if he is an inspiring kind of a man.

In a play that captured our hearts a generation ago the genial but worthless husband pointed out to his wife his great value as a bad example which the children should not follow.

That is the spirit of this article.

## Measuring the Sag and Pull in an Overhead Line

FOR measuring the height of an overhead line above ground at a number of equidistant points between two towers, A. Vaupel, in a recent issue of *Elektrotechnische Zeitschrift*, suggests the use of a tall collapsible stick, made of an insulating material similar to bamboo, with a scale painted on it. One man carries the pole and a second man sights through a telescope from a selected point on a tower near the ground to a point on the same height above ground on the next tower. He reads the elevation of this second line above ground on the calibrated stick. Such measurements, made at a few points between two towers, may be drawn to scale on a cross-section sheet and will give the exact sag of the wire. A grounding wire is attached to the stick, to safeguard the man holding it in direct contact with the live transmission wire. From the sag, the known weight of the wire per unit length and the distance between the towers and the temperature during measurement the author gives a formula for calculating the pull on the wire. The use of this method and formula is explained by an example.

# Demand-Meter Maintenance*

## Importance of Suitable Location for Installation of Meters—Organization of Inspection and Maintenance Service—Desirable Records—Attention Required by Different Types of Instruments

By E. A. LE FEVER
*Superintendent of Meters, Buffalo General Electric Company*

MEASUREMENT of demand has come into general use in America only during recent years because of the fact that high-grade devices were not previously obtainable and because there was not the general attention given to the accuracy of metering that exists today. In most companies demand is measured on all large customers. The revenue derived from the demand-meter customers may run as high as 30 per cent to 50 per cent of the total gross measured revenue, though the number of such customers may be as low as 1 per cent to 2 per cent of the total number of metered customers. Because of the magnitude of the revenue dependent upon correct registration of these meters, it is exceedingly important that they be carefully installed, inspected and maintained.

### Proper Location an Important Factor

Fortunately the demand for good meter locations became general before the advent of many metered-demand contracts. If it was important to have a good location for a watt-hour meter, which was visited for test purposes only once in one, two or three years and once a month for reading, it is much more important to have demand meters installed in accessible positions, as they are visited from two times a month up to one or two times a week. In the choice of watt-hour-meter locations accessibility was not the only factor. Rightful insistence has been placed on locations for watt-hour meters which are not only accessible but free from vibration and extreme changes in temperature, reasonably light and clean. Demand meters in general are much more delicate pieces of apparatus than watt-hour meters and will not maintain their accuracy when subjected to abuse. Hence the even greater importance of selecting good locations for their installation.

It pays to have meters of all kinds installed in such a manner that the meterman has a chance to perform the duties assigned to him in a safe and accurate manner without taking unnecessary chances and with reasonable physical ease. A meter with demand attachment may be installed in a box on a pole and maintenance insisted on. But if weather conditions are not favorable, and it is raining or bitterly cold at the time of inspection, it stands to reason that this device will not receive the care it would get if it were installed in a building. Installations in unfavorable places should be avoided, and even if a slight increase in expense were necessary, avoidance of one error would often much more than pay for many such minor expenses.

Special care should be taken to give the demand maintenance inspector ample space for his work. The demand-meter auxiliary circuits should be fused to proper capacity and in such a way that the company employees may easily remove the fuses. Such auxiliary circuits should be independent of the main circuit so that the maintenance man may perform his duties without interference with the customer's service. If such precautions are not taken, there is always the possibility of short circuits, or the demand maintenance inspector may "take a chance" and say a device is "O.K." in cases where he might have done otherwise had he been provided with better means of performing his work.

One man should be in charge of all demand work. If one man cannot handle it alone, others should report directly to him. This places all the responsibility on one person and permits the shifting of work from one man to another if required because of transportation conditions, failure of devices, or difficulties which arise when one man gets behind the schedule.

TYPICAL DEMAND-METER RECORD

The responsible head should have enough time to permit his dropping in here and there to check up the other men. Demand maintenance, like meter reading, presents a chance for abuse in that it is a routine operation and suggests the so-called "curbstone" inspection all too often encountered in meter reading. This kind of inspection is far more serious in demand work because of the revenue involved and the fact that the device is set back each month. The honest man welcomes a check on his work. This chief demand inspector should have time to go on jobs where unusual conditions exist or where doubt has been raised. A new man will often see things which others have overlooked. If there is more than one kind of device on the system, one man may well follow each kind.

It is a good policy to give a certain number of demand customers to each man and have him care for these customers continuously. He will become acquainted with the general requirements of the plant and with the personnel of at least that part of the plant which has to

*Abstract of a paper presented before the Empire State Gas & Electric Association.

do with the operation of the electrical equipment. His familiarity with both the plant and the personnel will aid materially in accounting for low or high demands and will be of considerable value on any complaint adjustment in so far as the complaint work concerns the meter department. In our organization we make it a point to have the demand maintenance inspectors keep inventory of customers' connected load and also keep in personal touch with those responsible for the electrical equipment. In the case of small demand installations which do not fall in the factory class, it is felt that this personal touch assists greatly in ascertaining that demands are correct and satisfies the customer that such is the case. The impression that knowledge of plant operation should determine the accuracy of any measurement must not be gained, but nevertheless it has a bearing which is well worth considering.

The subject of transportation should not be overlooked, especially if there is an appreciable number of devices. The demand maintenance inspector should be able to go to any device concerning the performance of which he has any doubt without a serious inconvenience or difficulty due to the time that is required to reach the location and the resulting delay of other routine inspections.

### Frequency of Inspection

Frequency of inspection will depend on the types of devices. It has always been found advisable to base practice in this regard on experience and on the inherent characteristics and the dependability of the devices. When we start using a new type of device, the chief inspector handles it until he is personally familiar with it and then turns the device over to other inspectors who handle the work in the territory in which it is installed. The chief inspector retains enough of these jobs himself to familiarize himself thoroughly with the strong and weak points of the devices. New types receive at least a weekly inspection and are repeatedly checked. After the limitations of new devices are known the inspection interval is extended. It is believed the foregoing method is especially desirable in determining the reliability of devices and in the development of the demand inspectors themselves.

### Inspection Records

Regular record forms should be used in inspection work. The form should carry the date, demand reading, watt-hour reading, check of time interval on certain types, and other check tests and the tester's signature. All failures should be noted on these reports and the reason for failure given if possible. Failure records should show whether the trouble was cared for or not. Unusual high or low demands should be commented upon if a reason can be assigned. It is often useful to figure the consumption in kilowatt-hours per month and compare the pro rata kilowatt-hours and demand with previous records as a means of determining the reasonableness of unusual demands.

The inspection report slips should be small in size to be easily carried and be so arranged as to give the inspector several inspection records. As these sheets are filled they should be filed so that they will be readily accessible. Definite routes should be arranged and definite schedules followed. If this be not done, lax inspection may result and a device may fail and not be detected promptly.

The "Factograph" camera has been successfully used to take photographs of all demands where the record is destroyed when the meter is read. All meters where customers are on a demand basis are read by demand maintenance inspectors. This serves as a combined inspection and reading for billing. The meter superintendent should keep a classified record of all failures under each type of device. He may class these as failures beyond the control of the demand inspector, those which are purely within the inspector's control and those which are doubtful. This classification gives an excellent check on the type of device and on the work in general, because the record can be compared from month to month and from year to year.

### Demand Attachments on Kilowatt-Hour Meters

When using demand devices which are attachments to the kilowatt-hour meter, it is obvious that accuracy depends directly on the kilowatt-hour meter, and if it be a high-tension measurement, accuracy also depends on the accuracy of the instrument transformers. Instrument transformer defects are considered of great importance, and demand inspectors are required to be continually on the watch for defects. Defects will occasionally occur due to lightning or to plant disturbances caused by short circuits or other serious temporary overloads. The importance of this cannot be overestimated. They are often not as apparent as one would expect.

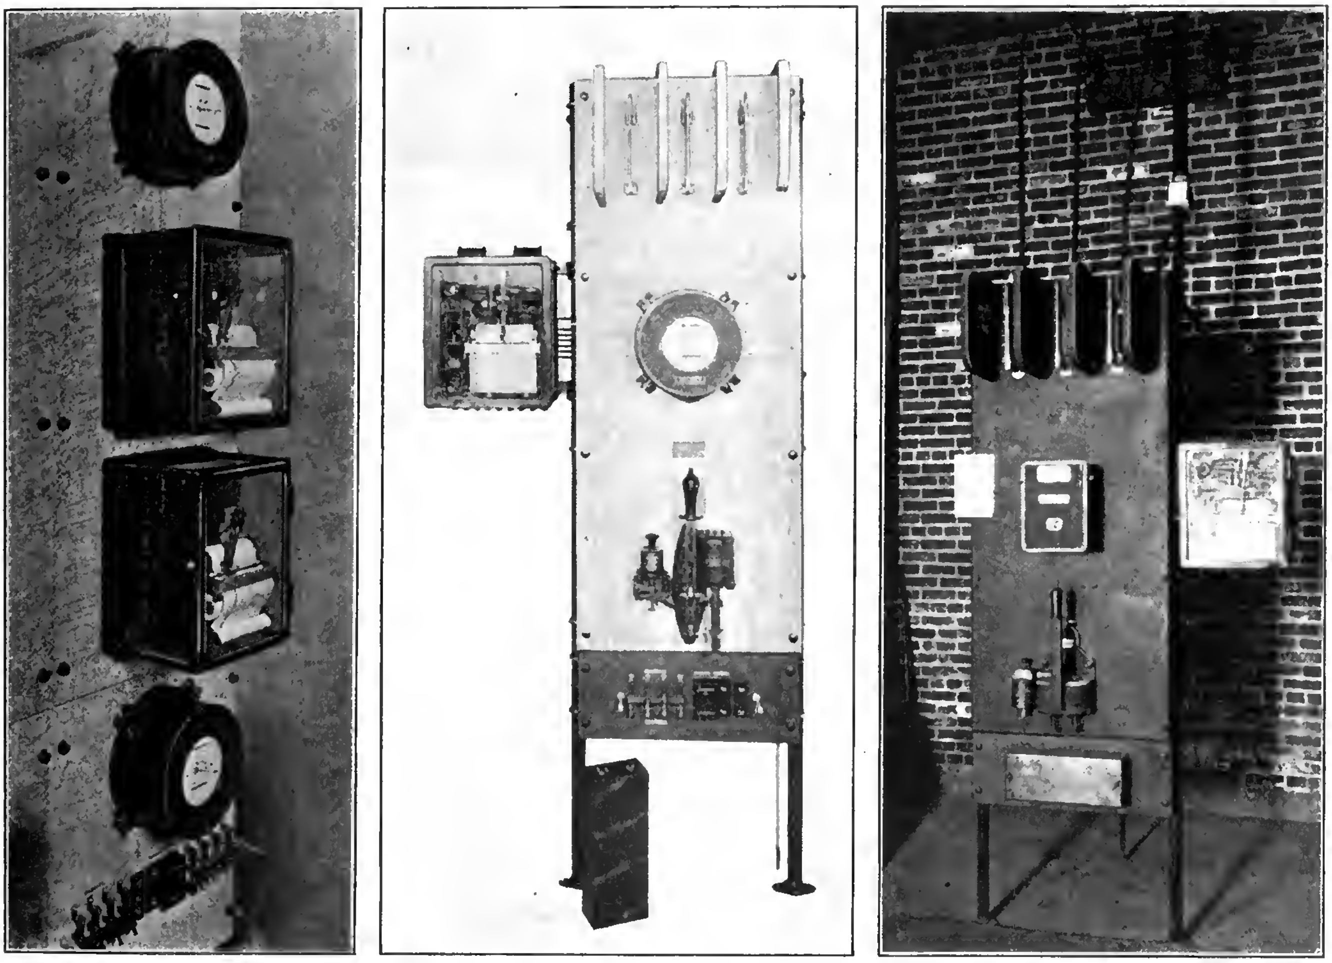
Where a contact mechanism is used on such meters it places additional friction load on the meter which is bound to have some effect on the light-load adjustment. Such combinations should be checked as a unit for watt-hour-meter accuracy. Demand inspectors should bear this in mind when handling such contact adjustments. The watt-hour-meter tester must also be careful about this. When necessary to change such contacts it is a good plan to retest. In the case of General Electric type M-4 devices a mid-month inspection is made, with a brief inspection at reading time. Should anything occur to throw doubt on the device at the time of the mid-month inspection, enough inspections are made before the monthly reading for billing to assure the inspector that proper demand has been obtained. Delay of billing may also be warranted by errors detected or suspected at the time of reading inspection. Contacts on such devices should be watched carefully to be sure they are clean and operate properly. The revolutions of the watt-hour meter should be compared with the impulses registered on the demand scale to obtain a complete check on the device. It is not necessary to do this for the entire interval. The speed of the timing element should be taken at each mid-month inspection. Meshing of teeth between the demand register and the timing shaft should be carefully noted each time a demand register is removed, since serious errors may occur, especially in the older types. If not watched off-scale reading may result from poor meshing or complete disengagement of the gears, and a high demand may result in the case of serious friction due to excessive meshing.

Occasionally a glass cover may bear down on the demand scale, causing improper registration which cannot be found when the cover is removed. The reset mechanism should be watched to see that it returns to zero. Occasionally, too, a contact coil or other wiring device within the meter may open circuit or, worse still, may develop a loose connection. These things should be watched.

In the case of direct-current measurements the General Electric type M-5 and M-6 devices are widely used. Previous comments apply to these except as regards the timing device. The M-5 timing device is an eight-day clock, and, though it is a good clock, it is subject to all the troubles found in any high-grade clock. Any clock mechanism must be kept clean. It cannot be installed and expected to run indefinitely without cleaning. Clock mechanisms should be cleaned at least once a year. It is a good plan to care for a portion of these each month. When cleaning, the clock should be taken entirely apart and all parts washed in gasoline. Damaged balance wheels and roughened jewels should be replaced by new parts. A small pocket magnifying glass will be found useful for examining shafts; a needle is best for examining the jewels. After thoroughly drying, all bearings should be cleaned with orangewood sticks, and any gum or other foreign matter which may adhere to the shaft ends should be removed. After being reassembled the clock should be thoroughly oiled with high-grade oil.

The General Electric Company recommends a high-grade mineral oil known as "Finol" for this service. This company discourages the use of fish oil especially on the M-6 meter. A twenty-four-hour run after cleaning and before installing is an excellent plan. Attempts to clean a demand clock by immersing it in gasoline (without disassembling), allowing it to dry and then oiling should be avoided. The instrument may run after such treatment and it may not. Do not blame the clock if it does not run with such treatment. Care should be taken to see that the mainspring is run down before attempting to disassemble these clocks. This is especially true in the M-5 type. Clock cleaning should always be done in the meter shop. The best results will probably be obtained if the regular maintenance inspector cares for this work unless the department is fortunate enough to have a real clock man on its staff. Good clock men are born and not trained. However, with careful training good results can be obtained. The average jeweler is of little value.

The M-6 device has an advantage over the M-5 in that it does not have to be wound once each week. If the M-5 is not wound on a very definite schedule each week, there is naturally a chance of losing the demand. A clean and smooth commutator is essential to good operation of the M-6 device.



SOME TYPICAL DEMAND-METER INSTALLATIONS WITH FACILITIES AT BOTTOM FOR TESTING

Eight-day key clocks have the same disadvantage in connection with graphic demand meters that they have when used in other devices, in that they require visits at a definite time. The electric clock on the Westinghouse M graphic meter has a reserve of thirty minutes minimum to sixty minutes maximum, which cares for ordinary power interruptions. The control potential transformer should be connected ahead of the main-line oil switch except in cases where the customer never opens the main-line oil switch.

The General Electric type M-7 and the Westinghouse type OA demand attachments are similar in many respects to the M-4 devices. The timing element is in the meter itself. These devices present very much the same problems described above. Contacts are, of course,

absent. The meter cover must be removed for any extended inspection. Care must be taken to see that dirt does not get into the meter. These devices are not recommended for use on installations requiring much over 50 kw.

The General Electric type G device has many elements in common with those previously described. It operates from contacts on the watt-hour meter and has an eight-day clock mechanism if it is not operated by a Warren motor. Care must be exercised in the handling of the waxed charts. The stylus must be handled carefully as a blunt point will result in indistinct charts. Tension on the stylus spring has a very material effect on clearness of the chart. The General Electric Company recommends the use of a definite weight applied in a definite manner to test this spring tension. Low temperatures may cause trouble securing proper operation of the stylus. The temperature should not be allowed to go below freezing; this can be prevented by the use of a special heating element with thermostatic control which can be obtained from the manufacturer. Zero adjustments and clock maintenance are as important here as in other similar types.

### Graphic Meters Which Are Independent of Watt-Hour Meters

With the various graphic types which are independent of the watt-hour meter, there is an excellent opportunity to check the demand device against the watt-hour meter by means of a stop watch since they should both give the same results independent of each other. The comments already made on the subject of instrument transformers apply equally here. A very definite schedule of placing the paper chart should be observed in connection with graphic meters or there will be either a loss of record or a waste of paper. It is not advisable to attempt to splice the paper because this may often result in failure of the record. Each time a new roll of paper is placed in a graphic meter its zero mark should be checked and adjusted if necessary. At the same time Westinghouse graphic meters should be checked for center scale by means of the calibration weight provided by the manufacturer.

The motor-control graphic meter of the Westinghouse company has a few features which are not common to the solenoid-control type. With these care should be taken not to set the contacts too close or the moving contact arm may bridge the two stationary contacts and burn out the motor. Fuses are provided for this motor. However, owing to the fine wire in motor winding, special care should be taken not only that the proper size of fuses is used but that the fuses will blow at their rated current. The cam or helix curve is an important consideration in this meter. In the event of wear it may be necessary to replace it.

Many graphics which are subjected to widely fluctuating loads will require special adjustment of the solenoid dashpots to prevent drawing too wide a curve. Individual graphic meters should be so adjusted after they are in position and operating. Solenoid dashpots ought to be cleaned out once a year. In removing them care should be taken not to dent them or serious errors will result. The glycerine level in the small dashpot connected to the balance arm should be carefully noted when installed and maintained at this point as the accuracy of the device will be affected thereby. Excessive vibration may change the level and produce serious errors.

Paper collection should be made about once a week, although with the motor reroll used by this company three times a month will suffice. If allowed to go too long, the reroll will carry so much paper that it is liable to catch under the drum. Paper should be dated, and if any record is lost, the fact should be noted. Each graphic meter inspector should go over each roll and see if there are any troubles indicated on the paper. If so, he should correct them.

Catching of paper under the driving drum is an old difficulty which is due to several causes, but which may be lessened to some extent, depending on the ingenuity of the maintenance inspector. For example, widely fluctuating loads cause considerable ink to be deposited on the chart. If the ink comes in contact with the glass door, the paper will stick and the reroll paper will not pick it up. This may be avoided to a great extent by placing a seal wire on the surface of the glass so that the paper will not strike it; or an extra idler roller may be inserted to prevent used paper from following the drum around under the roll.

Ink used in demand-meter registering devices should be free from any sediment or clogging of the pen will result. Ink should be strained through chemical filter paper. After trying many ink combinations, we are now using the General Electric No. 6 formula ink, to which we add pure glycerine, using about two parts ink and one part glycerine to thicken it. Many industrial customers' meters would not run through a week on standard inks. Pens are filled from once a month to three times a month, always using fresh ink.

### Tools and Meter Tests

Many special tools will suggest themselves for use on graphic instruments such as a grinding device for truing the armature commutators. A special tool for pulling out sticky dashpots, punches for pressing out armature shaft pins and other such useful and time-saving tools can be used to advantage.

Since graphic meters used to measure demand are usually confined to the larger installations, they should be run through their entire scale by use of phantom load and indicating instruments from once a month to once every six months, depending on their importance. The test should include ascending and descending readings on both the "as found" and "as left tests," these being recorded on the actual chart paper and turned in as the record of test. Before the "as left" test is made the graphic clock and other mechanism should be thoroughly cleaned mechanically and electrically. We do this on the job, using the small motor device previously referred to for truing the commutators on the graphic-instrument motors. Such tests should be strictly the duty of the demand maintenance inspector who is in charge of the graphic meters. Installation tests are also advisable.

It should be remembered that the graphic meter of almost any manufacture is one of the most delicate pieces of mechanism that is used in billing. Hence it must receive scrupulous care. If it is properly maintained on customers' premises, it will produce excellent results.

Too much emphasis cannot be placed on the fact that because some weakness may seem to be apparent in the above comments we should be very slow to condemn any device. The measurement of demand is a very different problem from that of a measurement of kilowatt-hours, necessitating far more complicated and delicate devices.

# Trend of Electrical Construction Costs

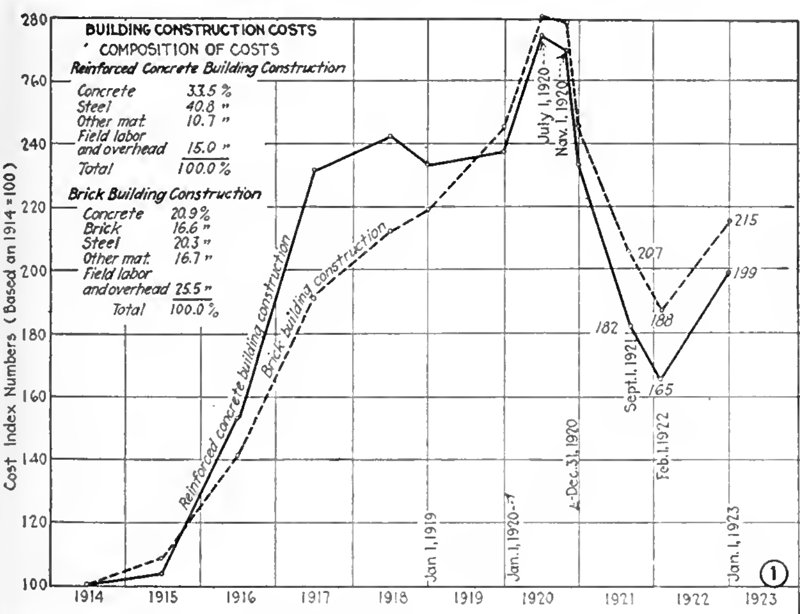
## Price Fluctuations of Major Items Composing Electric Light and Power Construction Work During Past Twelve Years—Index Curves Facilitate Estimates of Past and Future Construction

By WILLIAM W. HANDY
*Consulting Engineer, Baltimore, Md.*

IN CONNECTION with a valuation made by the author of this paper in the last three years, covering the property of a large gas and electric light and power public utility company in the Middle Atlantic States, there was occasion for the preparation of a rather unusually elaborate set of cost analyses of construction work, involving the determination of the relative costs of the several major elements making up the totals of various capital accounts, together with the unit costs of all of these elements and the percentage fluctuations in these costs over a period of years from 1911 to 1922 inclusive. During this period, as is well known, prices rose from the pre-war normal level to the war and post-war peaks, and subsequently fell to the minimum post-war level in 1921, from which in turn they have been on the average increasing to a greater or less extent during the year 1922, with the exception of equipment generally, the price trend of which has been downward.

As these cost analyses were prepared on an unusually comprehensive scale and covered such an extended period, it appeared that they afforded an excellent opportunity for the preparation of cost-index numbers and cost-index charts which would be of value to the industry and which would make it possible to tell at a glance the price trend of all major labor and material factors entering into the construction of a property and the price trend of each different kind of construction work, together with the price trend of the property as a whole, including buildings, power-plant and substation equipment, distribution system and all other items, including customers' installations. Furthermore, by the periodic posting of these index numbers and charts it appeared that the trend of construction costs could be continued and a record made which would be of permanent value through future years. While information similar to this is available in the form of the well-known cost indexes published by the United States Department of Labor and by the Bradstreet and Dun organizations and others, and while certain manufacturing and construction companies also maintain such records for the apparatus which they manufacture and for the work which they do, it appears that there is no similar service in effect especially applicable to public utility properties such as those of electric light and power companies. With this end in view the cost analyses made of the electric division of the public utility property in question have been used to prepare the cost-index charts presented in this paper, a brief explanation being herewith presented to set forth as clearly as possible the method used in the making of the analyses and in the preparation of the charts.

*Buildings.*—Costs of buildings, divided into reinforced concrete and brick types of construction as erected by the company,



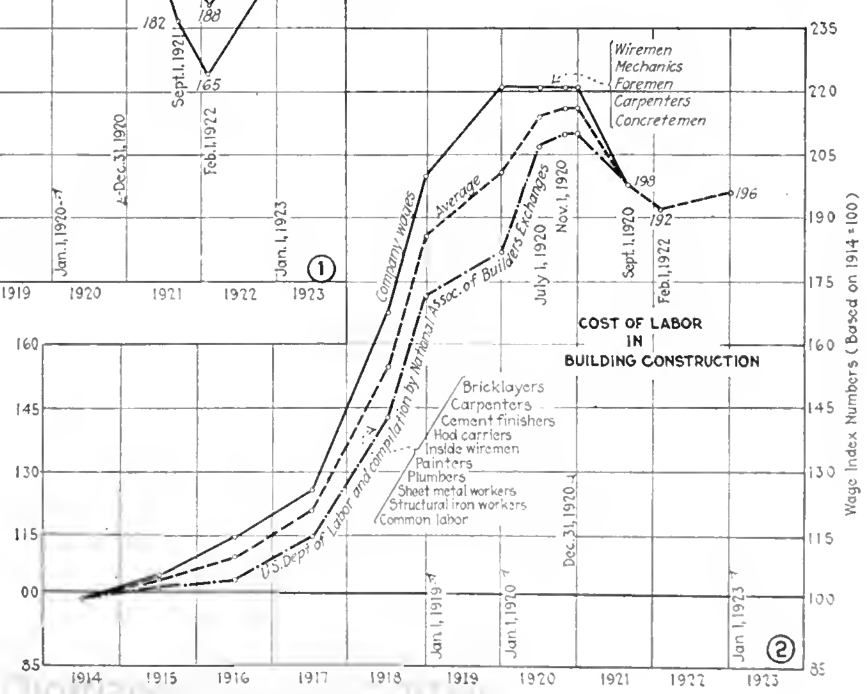


FIG. 1—BRICK AND CONCRETE CONSTRUCTION NOW 65 TO 81 POINTS BELOW PEAK PRICE AND RISING

FIG. 2—LABOR COSTS HIGHER THAN IN FEBRUARY, 1922, BUT RISING

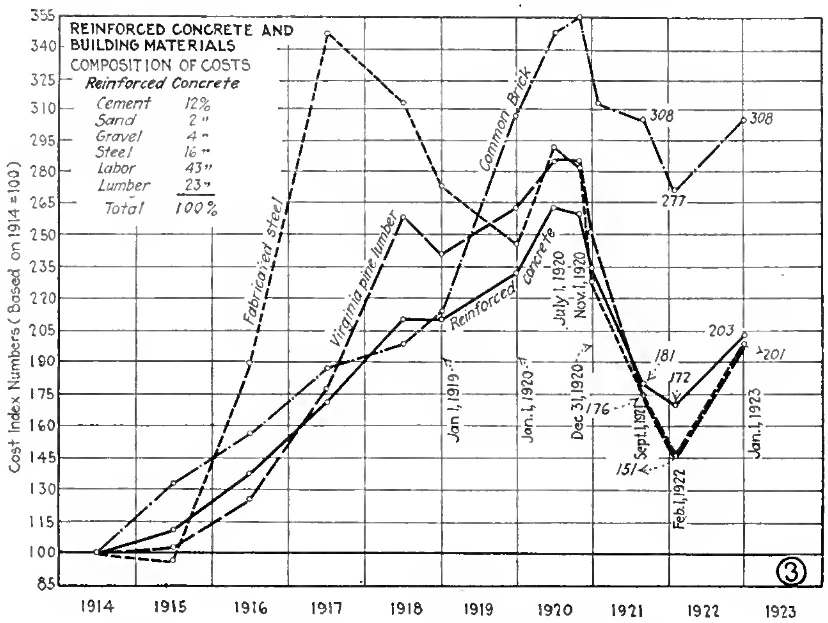

FIG. 3—OF ALL BUILDING MATERIALS BRICK HAS REDUCED LEAST

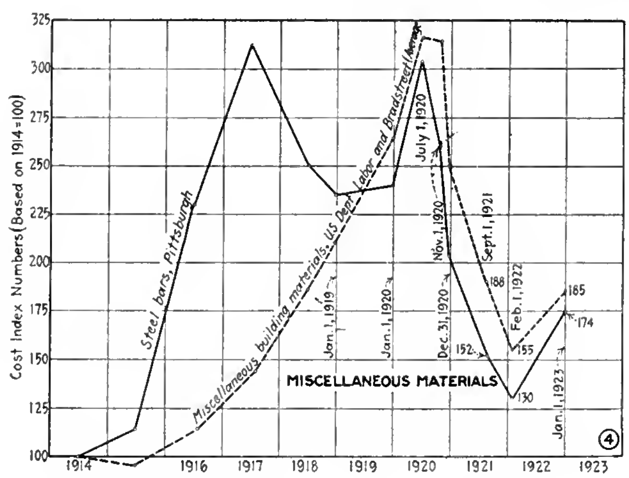

FIG. 4—MISCELLANEOUS BUILDING MATERIALS

were separated into the elements making up the cost, comprising cost of concrete in place, brick delivered, steel delivered, other materials and field labor and overhead costs. The percentage of each of these elements to the total costs was determined, together with the percentage of fluctuations in unit costs of each of these elements over the period from 1911 to 1922 inclusive. Weighted percentage fluctuations in the costs of these elements were then figured, the total of the weighted percentages plus a base figure of 100 giving the cost-index numbers of the two types of construction over the period, and from these the index curves as shown on Chart 1 were prepared.

Supporting the analyses from which Chart 1 was made, detailed analyses of the unit costs of reinforced concrete and the various elements entering into it were compiled and the percentage fluctuations in the unit costs of these elements from 1911 to 1922 inclusive determined, the same analyses being made of the costs of brick, structural steel, miscellaneous building material and the various kinds of field labor entering into building construction. The cost-index curves prepared from these analyses are shown on Charts 2, 3 and 4.

*Mechanical Equipment.*—An analysis of mechanical equipment as a whole entering into the total cost of power stations was prepared in a manner similar to the analysis made of building costs, the relative cost of each element, such as boilers, turbo-generators (mechanical end), piping, coal and ash handling, stokers and auxiliaries, condensers and tubes and pumps, and the percentage of each of these to the total cost, determined, together with the actual and weighted percentage fluctuations in the unit costs of these same elements from 1911 to 1922 inclusive, the total of the weighted percentages giving the fluctuations in the costs of mechanical equipment as a whole over the period, from which the

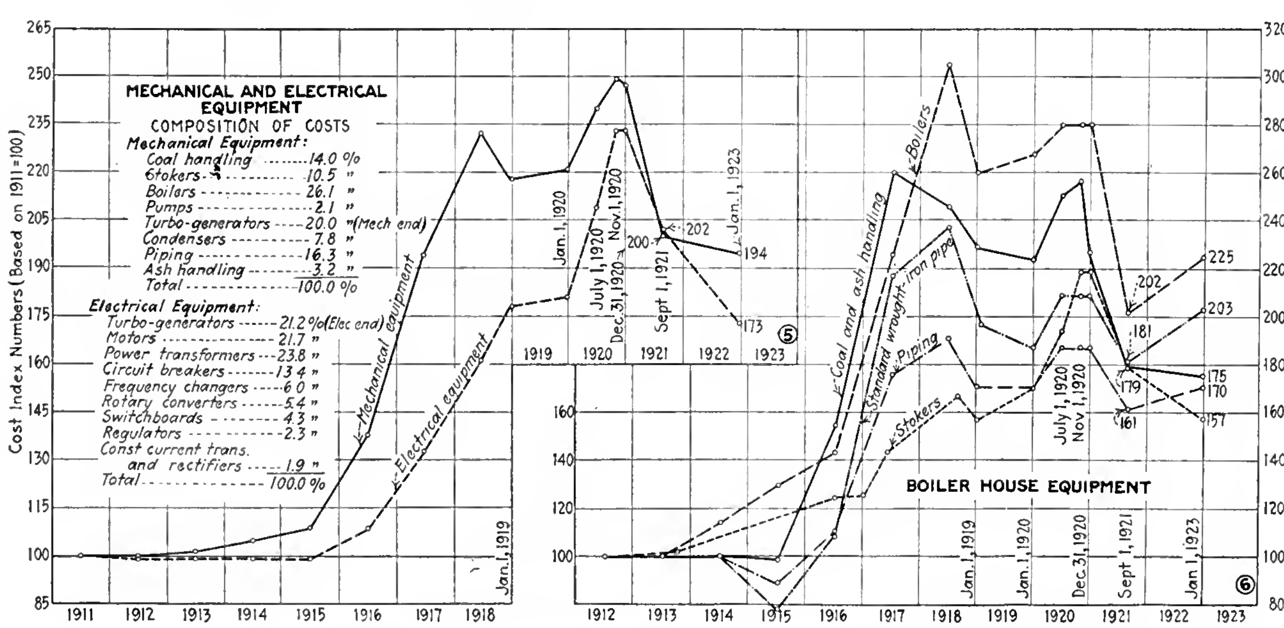

FIG. 5—ELECTRICAL EQUIPMENT ONLY 73 PER CENT ABOVE PRE-WAR LEVEL. FIG. 6—STOKER PRICES MORE REDUCED THAN BOILER

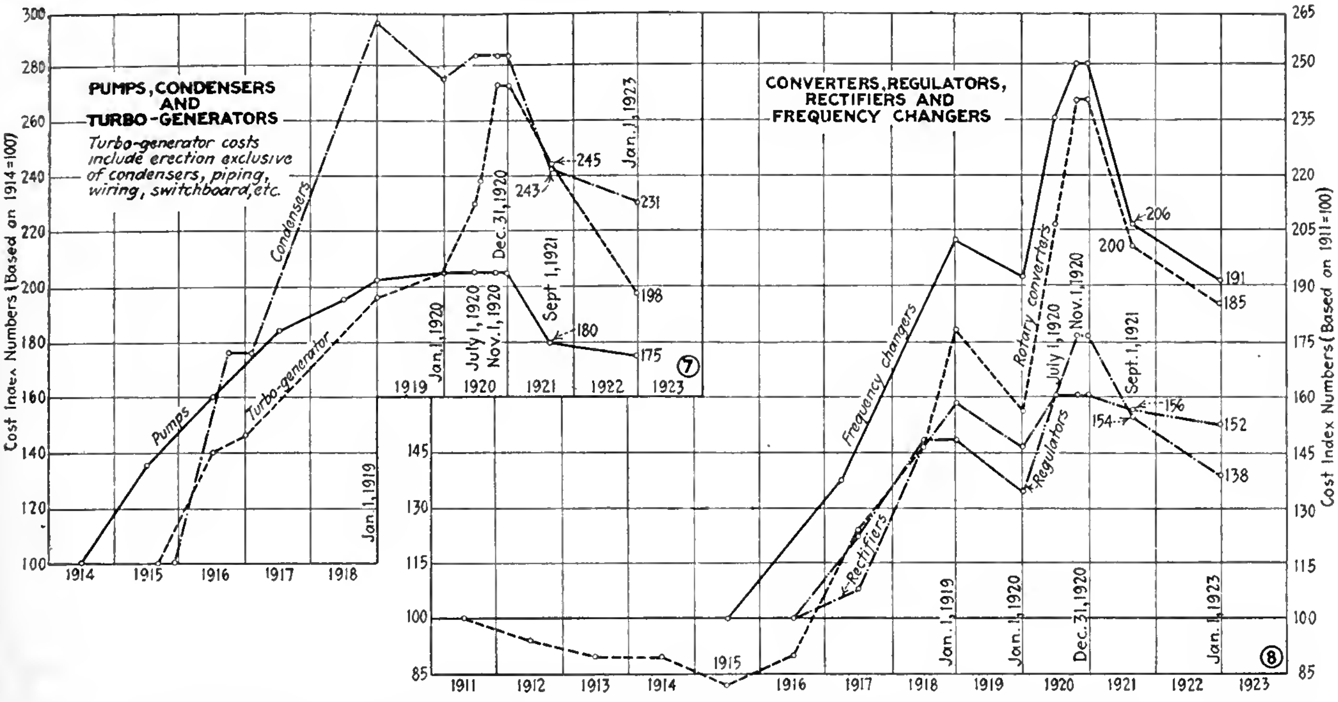

FIG. 7—TURBO-GENERATORS 72 POINTS BELOW PEAK PRICE; CONDENSERS 131 POINTS ABOVE 1914 PRICES. FIG. 8—FREQUENCY CHANGERS STILL 91 PER CENT ABOVE PRE-WAR LEVEL; RECTIFIERS ONLY 38 PER CENT ABOVE

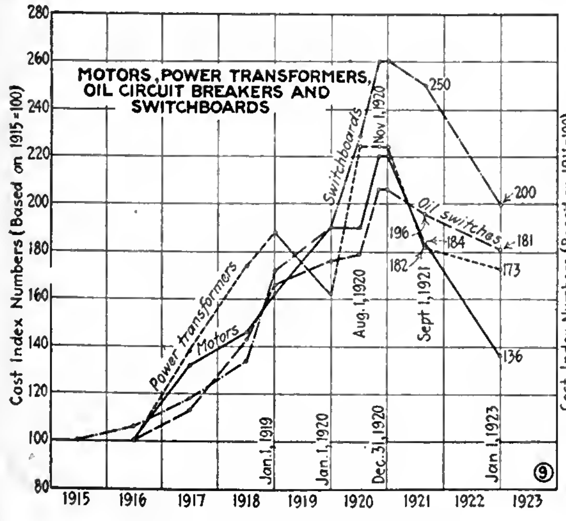
index-cost curve shown on Chart 5 was prepared, the cost index curves for boilers and the other elements of mechanical equipment being illustrated in the curves of Charts 6 and 7.

*Electrical Equipment.*—A similar analysis to that made for mechanical equipment was made for electrical equipment entering into the total cost of generating stations and substations, relative cost determined of each element such as turbo-generators (electrical end), motors, power transformers, oil switches, frequency changers, rotary converters, switchboards, induction regulators and constant-current transformers and rectifiers, and the percentage of each of these to the total cost, together with the actual and weighted percentage fluctuations in these same elements from 1911 to 1922 inclusive, the total of the weighted percentages giving the fluctuations in the cost of electrical equipment as a whole over the period, from which the index cost curve shown on Chart 5 was prepared, the cost-index curves for frequency changers, and the other elements of electrical equipment being shown in the curves plotted in Charts 8 and 9.

*Poles and Fixtures.*—Cost analyses of poles and fixtures were made similarly to the analyses of buildings and mechanical and electrical equipment. The relative costs of chestnut poles, cross-arms, braces and racks, guys, miscellaneous material, labor, hauling and overhead costs, and the percentage of these to the total cost, were determined, together with the actual and weighted percentage fluctuations in the costs of these same elements from 1911 to 1922 inclusive, the total of the weighted percentages giving the fluctuations in the cost of poles and fixtures as a whole over the period in question, from which the cost-index curve shown on Chart 10 was prepared, the index curves for poles, cross-arms and other elements entering into the cost of poles and fixtures being shown in the curves composing Charts 11 and 16.



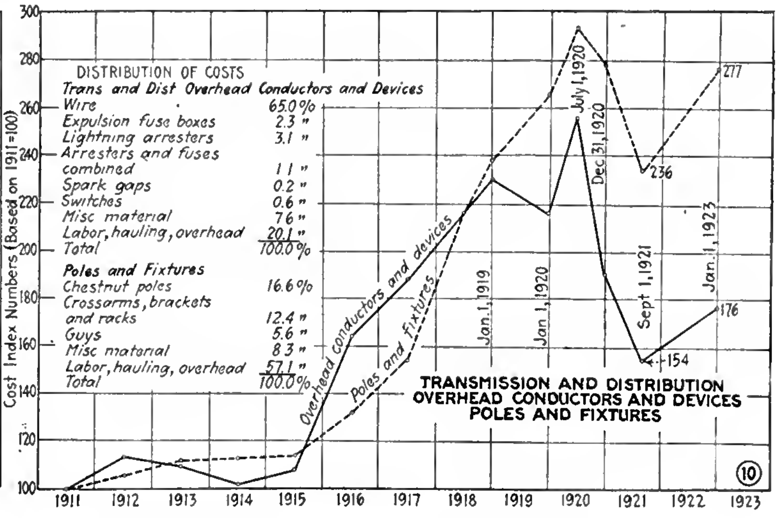


FIG. 9—OIL SWITCHES STILL 100 PER CENT UP, BUT MOTORS SHOW GREATER REDUCTION. FIG. 10—POLES AND FIXTURES NEAR PEAK PRICES; CONDUCTORS LOW BUT RISING

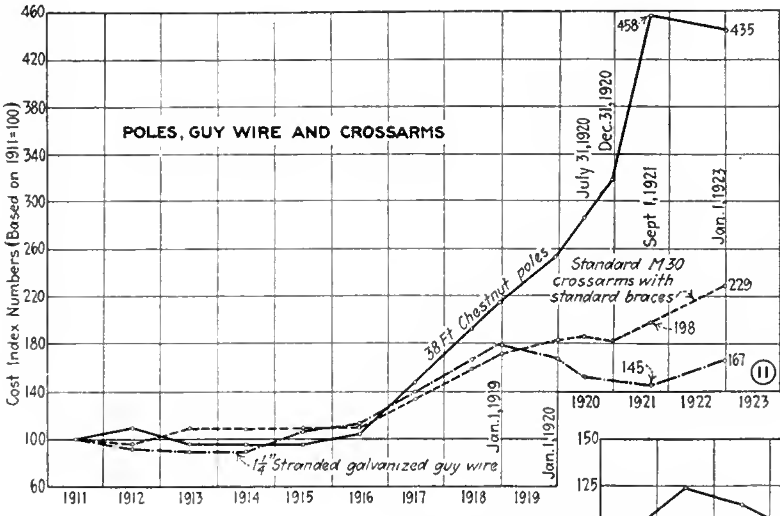

FIG. 11—CHESTNUT POLES ARE 360 PER CENT ABOVE PRE-WAR NORMAL

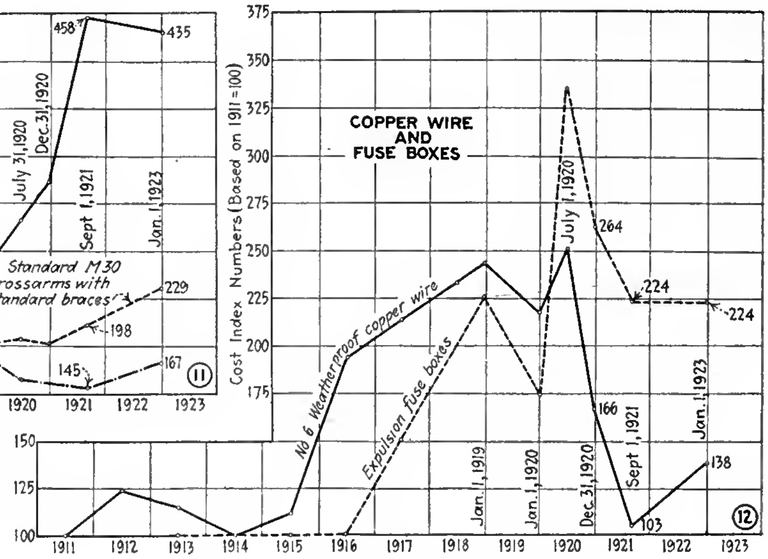

FIG. 12—COPPER WIRE LOW BUT RISING

*Other Capital Accounts or Kinds of Construction.*—Similar analyses to that made of poles and fixtures were also made of overhead conductors and devices, underground conductors, municipal street lighting, customers' services, electric house meters, distribution or line transformers, arc and glower lamps and customers' electric installation, the cost-index curves for these being shown on Charts 10, 13, 14 and 15 and the cost-index curves for copper wire, underground cable and the other elements entering into the costs of the above several kinds of construction being shown on Charts 12, 13 and 16.

*Total Construction and Equipment.*—Finally a cost analysis was made of the property as a whole, including all construction and equipment, but exclusive of land, unfinished plant investment, working capital and intangibles, such as organization and development, cost of obtaining capital, etc., and the relative cost was determined of each element entering into the total, including buildings and structures, mechanical equipment, electrical equipment, poles and fixtures, overhead conductors and devices, underground conductors, line transformers, arc lamps, municipal street lighting, customers' services, customers' meters and customers' installation, the actual percentage fluctuations in each of these elements for the

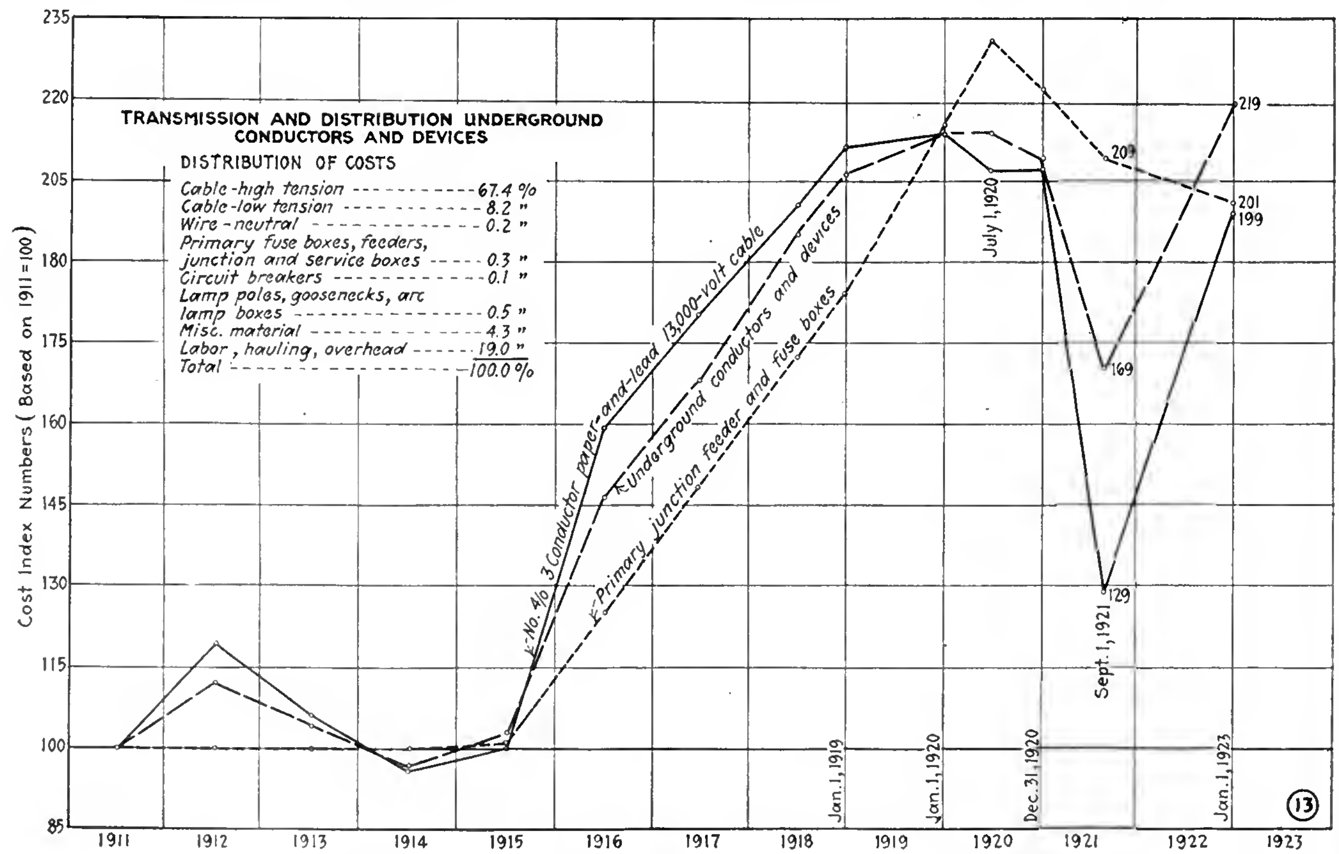

FIG. 13—UNDERGROUND EQUIPMENT NEAR PEAK PRICES AND RISING

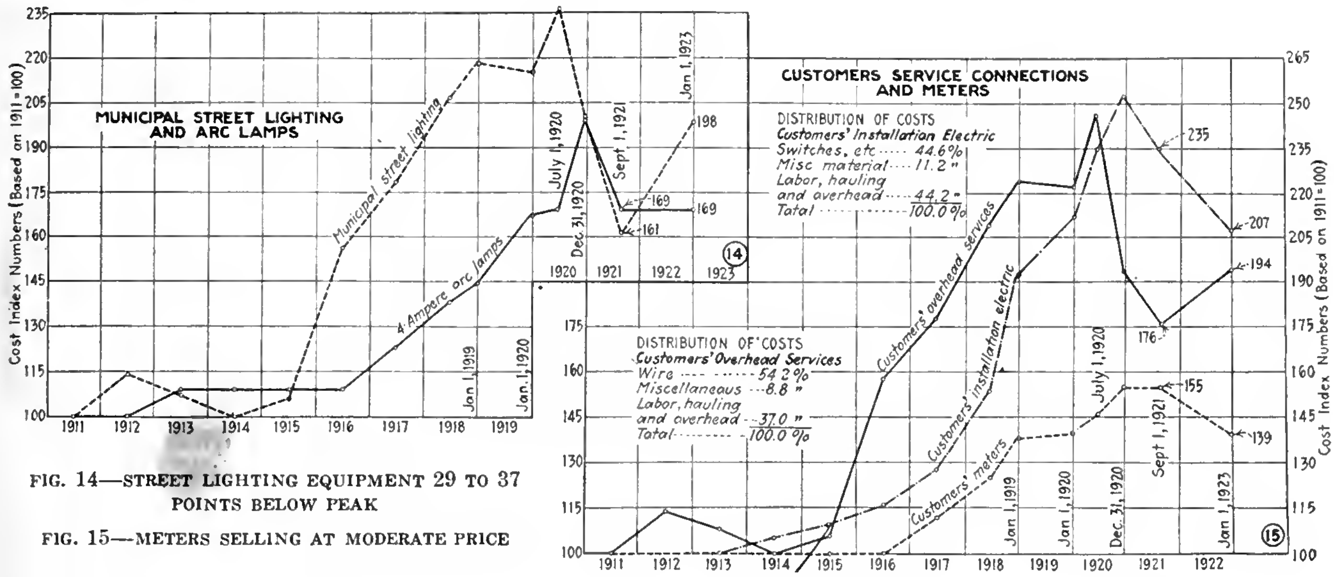

FIG. 14—STREET LIGHTING EQUIPMENT 29 TO 37 POINTS BELOW PEAK

FIG. 15—METERS SELLING AT MODERATE PRICE

period being taken from the analyses already made and the weighted percentage fluctuations being calculated therefrom, the total of the weighted percentages giving the fluctuations in the cost of construction and equipment as a whole from 1911 to 1922 inclusive, from which the cost-index curve for the entire property shown on Chart 17 was prepared. From this chart it will be noted that the cost index for a large electric light and power utility such as the one in question rose from the pre-war level in 1911 to a maximum in July, 1920, decreased from this date through the latter part of 1920 and through 1921 up to September, and from that date has been slowly rising through the past year to Jan. 1, 1923, as of which date the analyses were completed and at which time the cost index was 194, showing an increase over the pre-war period of 94 per cent.

## Derivation of Index Figures

For the purpose of illustrating still more effectively the method used and its application in deriving the cost-index figures from which the charts presented in this paper were derived, the table on page 864 gives the derivation of the indexes for total construction and equipment. By reference to this tabulation it will be noted that the upper part of it gives the actual costs under each capital account covering its particular kind of construction, including buildings and structures, mechanical equipment, electrical equipment, poles and fixtures, overhead conductors and devices, underground conductors, and so on down to customers' installation, together with the percentage each of these sub-totals bears to the total of all construction and equipment.

The lower part of the tabulation gives for each capital account the percentage fluctuation in cost for its particular kind of construction from 1911 to 1922 inclusive, together with the weighted percentage fluctuations in cost for each by years, the latter being derived by multiplying its percentage of the total cost of all construction and equipment by the actual percentage fluctuations, the actual percentages having been first derived from similar tabulations giving the cost analyses of each kind of construction—such, for example, as buildings and structures, which was made up from an analysis of the unit costs and percentage fluctuations in costs for each construction element (sand, gravel, cement, brick, structural steel, lumber, etc.) and the various kinds of building labor.

Again referring to the tabulation, the sums of the weighted percentages of buildings and structures, mechanical equipment, electrical equipment, etc., for each year were taken, giving the percentage fluctuations in cost for construction and equipment as a whole over the period, from

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

## The 1923 National Electrical Code

*To the Editors of the* ELECTRICAL WORLD:

In your issue of March 24 you published an account of proposed revisions of the National Electrical Code. Numerous inquiries which are being received by me and by inspection departments suggest that it is well to describe the present status of these rules. It should not be assumed that these new rules are now in force. The new edition of the code embodying the revisions is now being prepared and will be printed and made ready for distribution as soon as possible. We cannot say exactly when it will be issued.

Meanwhile we believe it will be the practice of most, if not all, inspection departments to be guided by the 1920 rules. Each inspection department, whether of underwriters or of municipalities, will after the 1923 edition is issued decide for itself on what date it will begin to operate under the new code. The electrical committee of the National Fire Protection Association, which prepares the code, assumes no responsibility for determining when the new rules shall be actually made effective by inspection authorities. We believe that confusion and misunderstandings will be avoided if all who are interested in this subject will proceed on the basis that the 1920 code is still in effect and will continue so to do until the 1923 edition is issued.

DANA PIERCE,
Chairman Electrical Committee.
National Board of Fire Underwriters,
New York, N. Y.

## Importance of Underground-Distribution Engineering

*To the Editors of the* ELECTRICAL WORLD:

The concluding lines of your editorial in the March 17 issue headed "Engineers Must Have Time for Forethought and Retrospection," were of great interest to me. Many engineers seem to look upon underground distribution as a necessary evil and not as the vital nerve of a system. This attitude may be due in large measure to the lack of proper training and incentive. In far too many cases a young graduate on joining a company with underground distribution is satisfied to accept an office job in that department and is content to lay out the work from that angle, hardly realizing or caring for the difficulties which beset the "outside staff." This attitude is all wrong, and only through actual outside experience, attention to detail and real interest in the work will "distribution engineering" become recognized and so come into the place that should be its own.

In my opinion distribution engineers should be se-

lected from men with a liking for outdoor work. On graduation they should be placed on the field staff, starting in to supervise under skilled engineers small matters such as the laying out of manholes, ducts, racking, splicing, etc. The importance of supervision of splicing and the correct radius and manner of bending the cables must be firmly impressed upon them, as it is in this actual field work that the maintenance costs either rise or fall. Too often there seems to be a tendency to fit the job to the cable, not the cable to the job, with ultimately disastrous effects.

Too many young distribution engineers cannot seem to realize that a badly made joint may when it subsequently fails necessitate pulling out and scrapping two lengths of cable, nearly always difficult to use elsewhere. Properly engineered work, even though it entails high construction costs, ultimately pays by its immunity from breakdowns and loss of service. I should not advise any young engineer to take up distribution work unless he is heart and soul in his work; for it is in the detail of the actual field work that the success or failure of his system lies, and to gain the training he needs necessitates long hours, patience and a real love of his duties. Distribution engineering is not a "job"; it is a lifelong study, every day bringing up new problems with hardly two alike. W. E. BOYLE,

Engineer Transmission and Distribution Department.
United Electric Light & Power Company,
New York, N. Y.

### Gasoline Trucks Heavier than "Electrics"

*To the Editors of the* ELECTRICAL WORLD:

When your excellent editorial entitled "Penalizing the Electric Truck," which appeared on page 377 of the Feb. 17 issue, was reprinted in the *Literary Digest* of March 24, my particular attention was drawn to this sentence: "Therefore, in spite of its greater gross weight per net ton carried, due, of course, to the weight of the storage battery, the 'electric' is far easier on roads than any other type of truck."

Unfortunately this statement conveys an erroneous impression, since it it not in accord with the facts in the case. I give the exact data:

| | 1-Ton | 2-Ton | 3½-Ton | 5-Ton |
|---|---|---|---|---|
| C-T chassis only | 2,400 | 4,000 | 5,000 | 6,500 |
| C-T chassis with battery | 3,248 | 5,740 | 7,172 | 9,134 |
| C-T chassis with average-weight battery | 3,867 | 6,000 | 7,525 | 9,445 |

The weights of a number of standard-make chassis as given in the annual statistical number of *Automotive Industries* for Feb. 22, 1923, are:

| | 1-Ton | 2-Ton | 3½-Ton | 5-Ton |
|---|---|---|---|---|
| Kelley-Springfield | 4,670 | ..... | 7,730 | 8,400 |
| Mack | ..... | 5,400 | 7,970 | 8,550 |
| G.M.C. | 3,250 | 5,300 | 7,945 | 8,645 |
| Diamond T | ..... | ..... | 7,250 | 8,790 |
| Brockway | 3,250 | ..... | 7,075 | 9,215 |
| Pierce-Arrow | ..... | 6,000 | 8,300 | 9,300 |
| Garford | 3,500 | ..... | ..... | 9,350 |
| Sterling | ..... | 5,950 | 8,350 | 9,750 |

A comparison of the above figures shows clearly that there is not "greater gross weight per net ton carried," but in many instances the gross weight is lower than for gas trucks of the same capacity.

A feature that seems to be entirely overlooked in most motor-truck legislation is the fact that electric trucks are used almost exclusively for city transportation. With very few exceptions none of them go outside urban limits. Since none of these trucks are used on state highways, some special consideration should be shown the users in taxation, as motor registration fees are applied to the upkeep of roads on which electric trucks seldom if ever operate.

Speed is another factor that has a great effect on wear of roads. The speed of the electric truck is inherently controlled. It is not subject to the whim of the operator. As a result the wear and tear on streets and roads from the operation of electric trucks is very much less than from gasoline-propelled vehicles of equal gross weight. Moreover, as the weight increases the speed automatically decreases, this feature being due to the characteristics of the motor itself, which acts automatically to adapt the speed to local conditions. We thoroughly understand that there was not the slightest intention to be unfair to the electric truck, but that, on the other hand, your desire is to further its use and protect its interests. Therefore the above facts are brought to your attention. H. S. MEESE,

Commercial Truck Company, Transportation Consultant.
Philadelphia, Pa.

### Calibrating Five Meters Simultaneously

*To the Editors of the* ELECTRICAL WORLD:

I note with considerable interest the article by R. S. Hinman in the Feb. 24 issue of the ELECTRICAL WORLD (page 458) describing a method for calibrating five meters simultaneously, with particular reference to the number of meters tested per day. There is no question that the method described is both an accurate and a rapid one. At the same time I do not believe it is possible to test and stock from one hundred to two hundred meters per day, as is there stated.

Testing a watt-hour meter consists not only in determining whether the number of revolutions of the meter is correct in a given interval of time for the energy passing through the meter, but also that the test constant, register gearing and dial constant bear the correct relation to each other to translate correctly those revolutions into kilowatt-hours as registered by the dial. Furthermore, the mechanical condition of the bearings and the register gearing and the clearance of the disk between the jaws of the magnet should be inspected carefully and readjusted if found necessary.

Even new meters from the manufacturer are sometimes received with a wrong register ratio or constant, resulting in incorrect billing. The bearings may become damaged in transit or some of the parts get out of alignment. The point I wish to emphasize, therefore, is that it is not sufficient simply to test the accuracy of the meter without taking its mechanical condition into consideration. This cannot be properly done at the rate mentioned by Mr. Hinman.

C. H. INGALLS,

Edison Electric Illuminating Company, Meter Engineer.
Boston, Mass.

*To the Editors of the* ELECTRICAL WORLD:

In regard to the letter from C. H. Ingalls of which you sent me a copy I may say that we have been able to average 120 meters a day with new meters. This includes cleaning with compressed air, cleaning between disk and magnets, checking dial and disk constants, and test. We have tried also the method of checking one meter at a time. I am very much in favor of the present method. R. S. HINMAN.

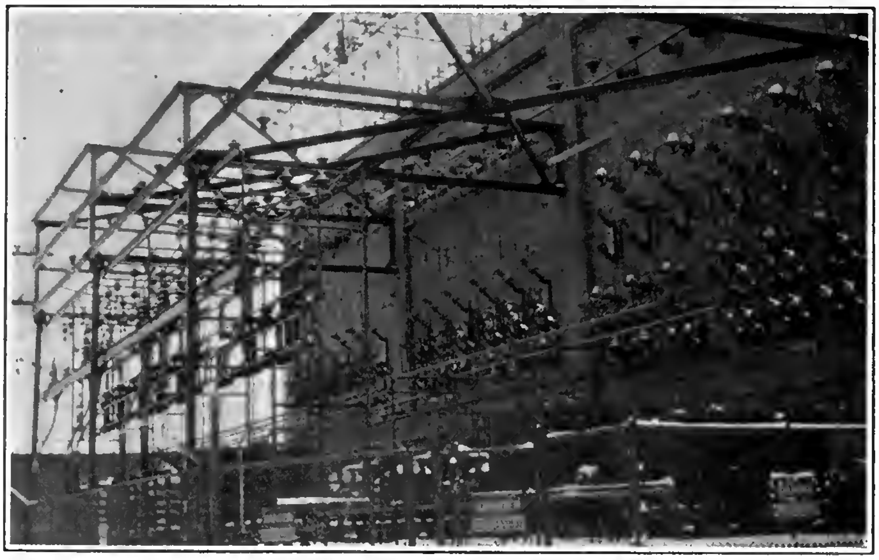
New Haven, Conn.

# Central Station and Industrial Practice

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

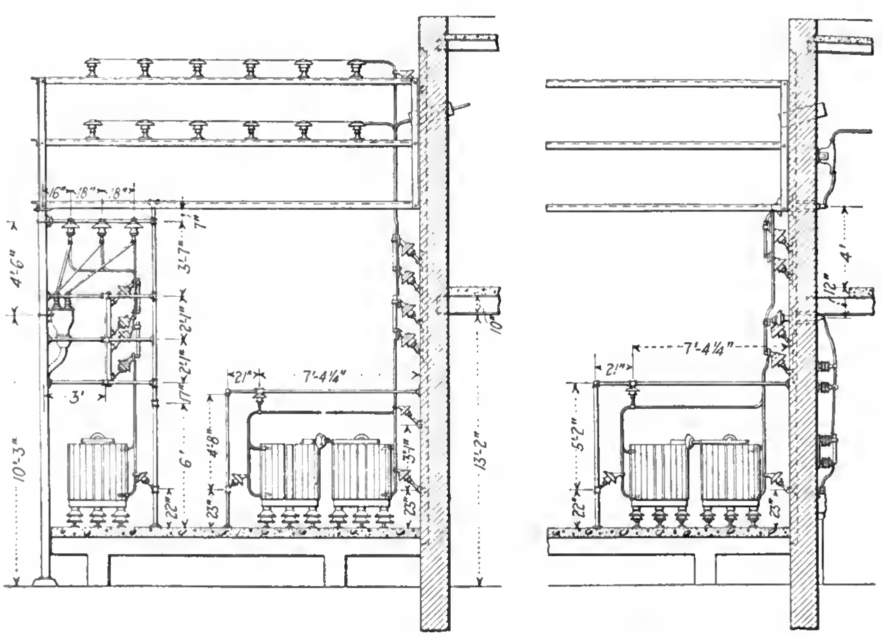
## Installing Twenty-seven Reactors for $20,177

THE continued increase in generating capacity of the Central Illinois Light Company's main station at Peoria, Ill., required a corresponding additional increase in protective devices. The choice in giving this protection lay between installing higher-capacity circuit breakers and installing current-limiting reactors. Since the space required for breakers of the larger rupturing capacity was not available, nine three-phase sets of outdoor reactors were installed. Eight of these sets, with a rating of 200 amp. at 13,200 volts, were placed in circuits feeding various mine and mill loads. These reactors have a reactance of 2.76 per cent at 4,600 kva. load. The other set, standing 62 in. high, has a higher rating of 300 amp. at 13,200 volts and supplies service to the Keystone Steel & Wire Company of South Bartonville, a suburb south of Peoria. This unit has a reactance of 4.32 per cent at 7,200 kva. The total cost of the entire installation was $20,177.88.



OUTDOOR REACTORS MOUNTED ADJACENT TO SWITCHES WITH FACILITIES FOR SHUNTING OUT OF SERVICE

Not having space within either the generating station or the substation to install these reactors, it was necessary to place them outdoors between these two buildings, as shown in the photograph. Since this space also served as a driveway, it was not feasible to use any more of the space than necessary without restricting the entrance to the rear of the plant. Therefore a concrete platform, 56 ft. x 17½ ft., was erected 2½ ft. above the ground directly next to the substation wall. On this wall were placed the air-break switches in direct line with the reactors themselves. The steel superstructure afforded supporting means for the bus work on the outer row of reactors, besides allowing the top of the structure to serve as an insulator base for the distribution circuits. The circuits to the left of the reactors in the diagram come direct from the Liberty Street generating station through underground ducts. After passing through the reactors, these circuits continue through 3½-in. conduit embedded in the ground beneath the platform to the substations served by these feeders. Switching controls are so arranged that these reactors can be shunted out of the circuit without service interruption, thereby giving continuity should trouble arise on these reactors.



REACTORS PREVENT VOLTAGE FROM DROPPING BELOW 70 PER CENT OF NORMAL DURING SHORT CIRCUIT IN SYSTEM

Before these reactors were installed the main bus voltage would sometimes drop to zero when a short circuit occurred on one of these 13,200-volt feeders. This would also cause a general disturbance all over

the system and at times create a complete shut-down due to generators falling out of step. Since installing these reactors several short circuits have occurred, but at no time has the main bus voltage fallen more than 30 per cent below normal. The percentage reactance is calculated to maintain 50 per cent of normal bus voltage when a short-circuit occurs just beyond the reactors or right at the main station without any line in the circuit.

Peoria, Ill.

## Divided Opinion on Value of Flexible Couplings

THE application and operation of flexible couplings were discussed at a recent section meeting of the Association of Iron and Steel Electrical Engineers held in Pittsburgh. Both operating men and representatives of manufacturers told of the strong and weak points in various coupling designs. Perhaps the most important facts brought out were that the couplings should be properly installed with as little misalignment as possible, that they should be checked at intervals to make sure that misalignment has not become excessive, and that the couplings should be kept thoroughly lubricated. The difference between the elastic type of coupling and the coupling which only transmits power from one shaft to another without any elasticity was dwelt upon. There was some difference of opinion as to the need for elasticity to prevent transmitting shocks from the driven machinery to the driving equipment and vice versa. Two representatives of motor manufacturers claimed that an elastic connection was necessary. On the other hand, two operators and one coupling manufacturer said that they had found no shock absorber necessary.

It was stated by some of the operating men that end thrust, sometimes of an excessive amount, was present with practically all types of couplings. Ample lubrication, they held, is the only means of reducing this to reasonable limits.

The effect of synchronous vibrations in producing very wide oscillations was discussed. It was shown that if ordinary steel springs are used in the couplings oscillations of a certain frequency may start mechanical surges which may eventually do much damage. These oscillations may be damped out by friction or by the use of elastic materials like rubber and leather in place of steel springs. It was also pointed out that if necessary the springs could be made with a varying modulus of elasticity so that they would not have any definite oscillating period. One speaker asserted that if the vibration periods of the machinery were studied a spring might be chosen with another period and this would eliminate surges.

## Starting Motor-Generators from the D. C. Side

THE most important point in starting an induction motor-generator from the direct-current side is to have the field of the generator properly excited at the start. Should the field current be open or should too much resistance be cut in the field circuit, the machine may not turn over, or, should it start, its speed would increase to a dangerous value. Full field strength gives maximum starting torque and minimum running speed. During starting the generator has its field connected to the bus, but when running it should be connected across the brushes to insure safety of operation, as a loss of field might occur under separate excitation and cause the machine to race. The following rules for starting synchronous or induction motor-generators from the direct-current side have been abstracted from the operating code of the Philadelphia Electric Company:

STARTING

1. Where an oil pump is provided, start it. Adjust the valves on the pipes feeding the bearings so that the one farthest from the pump will be open widest. If this does not lift the shaft from the bearing, open one valve wide at a time until the shaft does lift. Then adjust the valves as stated above It is necessary on some machines which are hard to start to assist the starting by hand with a ratchet and bar.
2. Make sure that the generator field rheostat is all out.
3. Test the generator field switch for voltage, and if there is no evidence of any, throw the switch to the bus side.
4. Close the direct-current circuit breakers.
5. Close the machine selector and starting resistance selector switches; then place the starting switch on the first point.
6. If the starting resistance is connected to the positive bus, close the positive machine switch.
7. Cut out the starting resistance, pausing between steps to allow the armature current to decrease to a low value, and when the last point is reached close the negative (or positive) switch. (Note.—In some cases it may be found that the acceleration is too violent and the current excessive in passing from one resistance step to the next. In these cases increase the speed on each starting point to approximately that of the next point by weakening the field. Then, simultaneously, bring the field up to full strength and pass to the next starting point.)
8. Test the field switch and, if no difference in potential between the two contacts is noted, throw the field switch to the machine side. Restore the machine selector and starting selector switches to normal positions.
9. Bring the machine up to speed by cutting the field rheostat in, synchonize and close the machine oil switch. (Note.—If the motor is a synchronous motor, close the motor field switch, adjust its voltage to that of the bus and synchronize.
10. Load the generator.

SHUTTING DOWN

1. Reduce the load on the machine to be taken off as much as possible.
2. Trip the circuit breaker and open the machine and equalizer switches.
3. Open the alternating-current bus switch.
4. In the case of a synchronous motor, cut all resistance in the field and open the field switch.

## Instructions for Banking Boilers

IN GENERAL. boilers should not be banked until the load on every boiler in service falls below normal rating. As all coal burned during the banking is a loss, every effort should be made to reduce the draft through the fire bed and setting to a minimum. During the banking period stokers should be turned over occasionally to prevent the fire bed from becoming too porous or honeycombed. These rules form part of the operating code of the Philadelphia Electric Company, from which the following instructions for banking boilers are abstracted:

1. Cut off the forced draft.
2. Stop both the induced and forced draft fans.
3. Cut off the stokers. In case of light fire at the time of banking, let the stoker turn about three revolutions to give a bed of green coal and repeat this operation approximately every hour during the banking period.
4. Close the damper of the stack draft until the opening is just sufficient to clear the furnace of gases.
5. Close the main feed-water valve to the boiler.

# Most Economical Power Factor

## Must Be Considered from Standpoint of Investment in Apparatus—Use of Synchronous Condensers and Unity-Power-Factor Motors Analyzed

That 100 per cent may not be the most efficient power factor for a commercial installation was shown in a recent paper presented before the Power Sales Bureau of the New England Division, N. E. L. A., by A. R. Stevenson, Jr., of the power and mining engineering department, General Electric Company. The speaker analyzed a system where the power company installed a synchronous condenser near the load center. The question arose as to what power factor is the most economical. The answer was a compromise between the determination of the most efficient power factor and the best power factor from the standpoint of investment in apparatus.

Considering the addition of synchronous condensers to a power system for the purpose of raising the power factor, the most efficient power factor, said the speaker, will be given by the formula:

Power factor $= 1/\sqrt{1 + (c/a)^2}$, (1)

where $c$ represents the losses of the synchronous condensers, excluding the excitation loss expressed as a fraction of the kva. rating of the synchronous condenser (do not include the excitation loss of the synchronous condenser because the ampere-turns excitation furnished in the synchronous condenser balances other ampere-turns which would have been necessary in the generators and it simplifies the problem to assume that these balance exactly), and $a$ is the total resistance loss at unity power factor and given load in the alternators, transformers and distribution system expressed as a fraction of the load in kw.

The losses of a 300-kva. synchronous condenser are 21 kw., but 5.5 kw. of this is the excitation. Therefore $c = 15.5/300$, or approximately 0.05.

The losses in the alternators, transformers and transmission lines are between 10 per cent and 15 per cent. By substitution in equation (1), the most efficient power factor for these two losses will be 89 per cent and 95 per cent respectively.

From the standpoint of lowest first cost the best power factor is given by the formula:

Power factor $= 1/(1 + b^2)$, (2)

where $b = m/(n + p)$, (3)

$m$ = the price per kva. of the synchronous condenser,

$n$ = the price per kva. of the generating plant,

$p$ = the price per kva. of the distribution system.

A 2,500-kva. turbo-driven generator costs about \$5.20 per kva. If the turbine is included, the price is about \$14. It is likely that if a customer buys a larger generator he will also buy a larger turbine. Consequently let $n$ = \$14. It is also likely, the speaker said, that the distribution system would cost at least \$20* per kva. Therefore let $p$ = \$20. Substituting these values in equation (3), $b = 0.325$. The best power factor from the standpoint of the first cost can be obtained by substituting this value of $b$ in equation (2). The power factor will be 91 per cent.

It is therefore advisable to raise

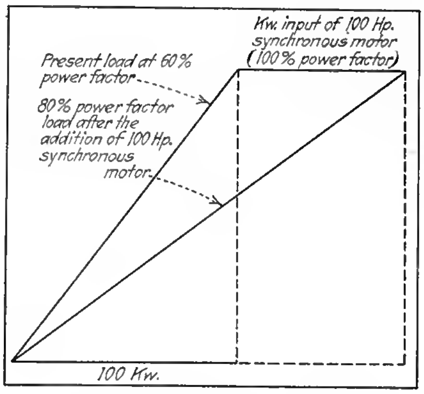

FIG. 2—POWER FACTOR OF SYSTEM IMPROVED BY ADDING UNITY-POWER-FACTOR SYNCHRONOUS MOTOR TO SYSTEM

the power factor to approximately 90 per cent from the standpoint of most efficient operation and that from the standpoint of lowest first cost the power factor should be somewhere in the neighborhood of 91 per cent.

While the losses of a 300-kva. synchronous condenser are about 21 kw., the losses of a 300-kva. static condenser are only about 1½ kw., but a static condenser of this size costs about 60 per cent more than the synchronous condenser. Static condensers need maintenance and should be installed and kept up by the power company.

When the synchronous condenser belongs to a customer the question cannot be solved in this way. The advantage derived by the customer in installing the synchronous condenser depends entirely on the bonus for power-factor correction given by the power company. This bonus must be compared with the fixed charges on the investment and the energy loss in the condenser which the customer has to pay for in his monthly power bill. The speaker knew of only about seventeen power com-

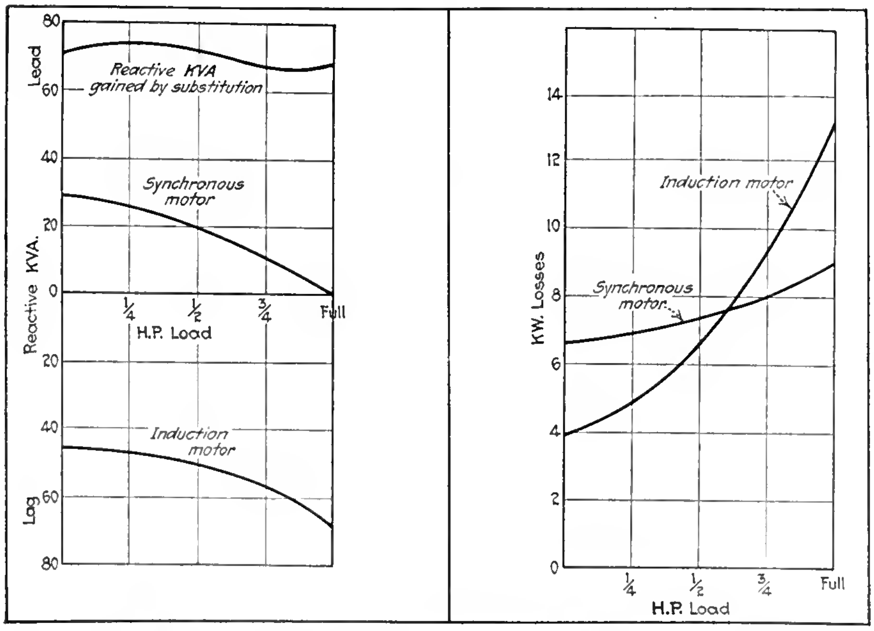

FIG. 1—COMPARATIVE CHARACTERISTICS OF UNITY-POWER-FACTOR SYNCHRONOUS MOTOR AND SQUIRREL-CAGE INDUCTION MOTOR

*The \$20 per kva. is not taken here as the total cost per kva. of the distribution system. It is the cost per kva. of increasing the capacity of the system and merely represents the cost of the copper required for a medium-sized system. The cost of increasing the capacity of the transformer banks should be included in any particular cost.

panies in the country which give bonuses for power-factor correction.

Unity-power-factor synchronous motors can be built for very little more than the cost of a slip-ring induction motor and have as good or better efficiencies. At low speeds the comparison is all in favor of the unity-power-factor synchronous motor as against an induction motor.

At the same time, a unity-factor synchronous motor will improve the customer's power factor, such a type of motor having been recently developed. The expense of installing these motors has been reduced to a minimum by simplifying the control. The exciters are adjusted for unity power factor at full load, and no field rheostats are necessary. The only control apparatus needed consists of a standard starting compensator and a standard field switch. The motors themselves being designed for unity power factor, they have good efficiency, and their prices are only slightly more than those of slip-ring induction motors.

The power factor can be improved considerably by adding a unity-power-factor synchronous motor as shown in Fig. 2. This figure represents a load of 100 kw. at 60 per cent power factor, to which is added a 100-hp. unity-power-factor synchronous motor. The result is approximately 180 kw. at 80 per cent power factor.

But if the alternative of installing an induction motor is considered, the improvement in power factor obtained by putting in a unity-power-factor synchronous motor is even more apparent because of the lagging kva. of the induction-motor alternative. Fig. 1 shows the comparative characteristics of a 150-hp. unity-power-factor, 720-r.p.m., 2,200-volt synchronous motor and a 150-hp. 720-r.p.m., 2,200-volt squarrel-cage induction motor. It will be noticed that with the field set at its full-load value the synchronous motor draws some leading kva. at part loads. The removal of the induction motor reduces the reactive lagging kva. The total improvement of the system obtained by replacing the induction motor with a unity-power-factor synchronous motor is the sum of the reactive kva. lagging of the induction motor and the reactive kva. leading of the synchronous motor. The change is therefore equivalent to adding a 70-kva. condenser. At full load the efficiency of the synchronous motor is better than that of the induction motor, but with full-load field setting the no-load losses are greater. However, even at no load these losses are only 2½ kw. more.

By this substitute there is gained the equivalent of a 70-kva. condenser with less than 2½ kw. losses. A 70-kva. synchronous condenser would have about 6½ kw. loss.

It is thus seen that when a customer wants to improve power factor it is sometimes more advantageous to replace an induction motor by a unity-power-factor synchronous motor than to purchase a synchronous condenser.

## Rugged Meter Case May Be Used as a Stool

THE combination meter tester's instrument and tool case shown in the accompanying illustrations was designed and built with the object of having everything in place so that tools, leads, etc., could be got at quickly and a meter tested in the minimum time. The case is strong enough to stand on when the meter cannot be reached from the floor, and in many cases this saves the time of hunting up a box or chair. The outside dimensions of the case are: Height, 17½ in.; length, 12½ in.; width, 9½ in. The testing apparatus carried consists of a test rheostat with a capacity of 0.5 amp to 15 amp. and a rotating standard meter with a rating of 1 amp. to 20 amp. Two compartments with a cover in the lid of the case are used for leads, jumpers, lamp socket and cord. Inside the case on the left side are pockets for meter seals, dust brush, slide rule and meter-test kit. In the bottom is a box 7 in. x 9 in. x 2 in. deep, with cover, which is used for extra fuse plugs, jewels and meter repair parts. The case with instruments and tools weighs 40 lb.

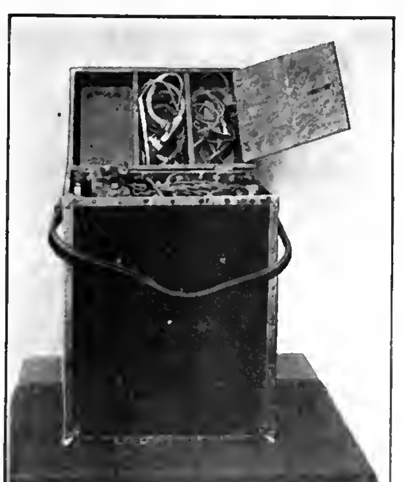
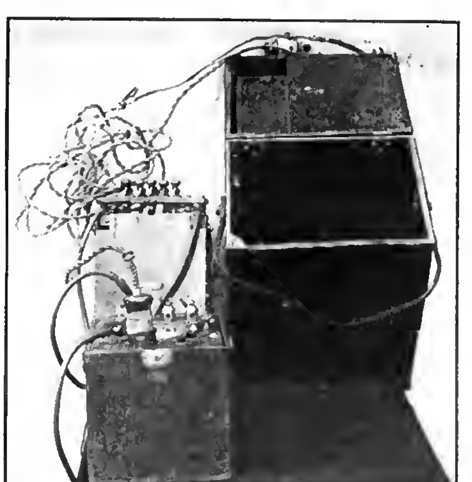
Los Angeles, Cal.





WHEN LID IS CLOSED CASE MAY BE USED TO STAND ON TO REACH HIGH METERS

## Handling Ice Troubles in Hydro Plants*

THE most important trouble to guard against in the design and operation of hydro plants is caused by ice. The ice is of three kinds—"local" ice (that is, cake ice that has been formed in the forebay or in the canals leading to the plant), up-river ice, which moves down from the creeks and tributaries into the main river and eventually will pass by the plant, and frazil and anchor ice. The first kind can be released through ice chutes or by removing the most troublesome pieces with the hoisting facilities of the gatehouse; very little of the second kind enters the forebay of a modern plant, and it may be regarded as harmless so far as interruptions to service are concerned. The third kind, however—frazil or anchor ice—although it creeps along stealthily and without spectacular accompaniments, is most dangerous. Some remedies can be provided in the design of the plant and equipment, but the most reliable protection lies in a systematic procedure for detecting the approaching danger well in advance and mitigating its disturbing effect by a well-organized system of protection.

There are many possible ways to diagnose impending frazil-ice runs,

*Abstract from address before a joint meeting of the A. I. E. E., A. S. M. E., A. S. C. E. and A. I. M. M. E. at New York, March 21, 1923.

beginning with the study of climatological conditions, accurate readings of water temperatures, inspection of submerged test chains or other metal objects, observation of the behavior of small waterwheel-driven auxiliaries that operate acoustic or optic signaling devices, etc. The remedial steps consist in the raising of the screens, maintaining of highest possible temperature in gatehouse and power house, continuous movement of guide-vane mechanism, steam or electric heating of those submerged metal parts where the ice is inclined to stick, etc. Electric heating may be used directly on the screens, or it may be applied indirectly by circulating air through heating chambers containing electric heaters.

The most simple and effective heating method consists in the use of a boiler that supplies a small header with steam which taps into each wheel casing. The steam is turned on alternately from one pit to the other, taking one unit out of service at a time. The steam does not actually melt the ice, but after a few minutes' application the ice coating loses its adhesive force, and when the water is turned on again the ice drops off and is washed out into the tailrace.

Baltimore, Md.

# "Wired Wireless" for Communication with Line Crews

EXPERIMENTS indicating the practicability of using high-frequency current for communicating with trouble wagons and line crews were conducted on March 26 by the Third Avenue Railway, New York, in conjunction with the General Electric Company. Although these particular experiments were conducted for application to electric railways, similar circuits may possibly be applied to central-station companies for communication between generating stations, substations, line crews and patrol wagons.

A laboratory set-up of a radio transmitting and radio receiving set was installed on a street car, with corresponding apparatus in a substation which supplied energy to the line over which this car was operated. Perfectly audible communication was conducted between the car and the substation from various points on the line, with the car either standing or moving.

The particular feature of this demonstration was the use of a duplex current whereby conversation could be carried on in either direction, just as it is done over the telephone. This was accomplished by utilizing two different frequencies. The transmitting set at one end and the receiving set at the opposite end were tuned for a frequency of 73,000, while the other pair of sets were tuned for 49,000 cycles. Currents of the two frequencies were thus conducted over the same wires, the trolley and feeder, without interference. By putting on the head telephones of the receiving set and talking into a transmitter connected with the transmitting set, it was possible to receive and transmit without the use of any changeover switch.

The set-up in the street car consisted of an ordinary simple radio receiving set with one three-electrode vacuum tube connected as a detector and another as an amplifier. The transmitting set made use of three type UV 203 tubes of 50 watts capacity. These three tubes were used as an audio-frequency amplifier, an oscillator and a modulator. The power for the sending set was supplied by a 1,000-volt motor-generator set with the energy to operate it supplied by twelve cells of storage battery supplying approximately 24 volts. A similar set-up was used in the substation, except that in the receiving set only a single tube was used as detector and amplifier. In the substation the sets were connected to the outgoing feeder through a condenser of low voltage drop. A condenser was, of course, also inserted in the circuit between the set on the car and the main power-feed wire from the trolley.

The General Electric Company had been engaged in experimental work on the Third Avenue Railway for several weeks to determine the constants of such a system, looking toward the development of suitable apparatus for utilizing high-frequency carrier current for communication work. While it is possible to establish communication between any point on the system and any car suitably equipped with apparatus, the idea will be primarily to devise plans for communication between some central emergency office and line and trouble crews, construction and repair gangs, and, perhaps, such transportation men as starters and inspectors out on the system. The principal advantage of the wired wireless as compared with radio communication is that it requires much less input of power, and that, while the current probably spreads over the entire overhead and feeder system, the radiation into the ether is very small so that it introduces practically no interference with any radio communication. It would therefore not be necessary for a railway company to have a government permit for a radio sending station in order to use its own system for wired-wireless communication.

The demonstration on the Third Avenue Railway was conducted in the presence of an invited group, including representatives of the General Electric Company, the American Telephone & Telegraph Company, the Radio Corporation of America, the Electric Storage Battery Company, the ELECTRICAL WORLD, local newspaper men and officials of the Third Avenue Railway. The test was in charge of Walter J. Quinn, electrical engineer of the railway company, and Edward Austin of the General Electric Company.

## Connecting Service in 2 Hours 48 Minutes

**How the Syracuse Lighting Company Takes Applications, Passes Credits and Gives Service in Less than Three Hours' Average Time**

NOTHING a central-station company can do will earn greater appreciation from a customer than quick action in connecting up his service after the application has been made. With the object of reducing to a minimum the elapsed time between the signing of the application and the cutting in of the service, the Syracuse (N. Y.) Lighting Company has adopted a method of dispatching and executing "connect-up" orders which has virtually eliminated all lost motion. It has brought the average elapsed time per order down to two hours and forty-eight minutes and has made many solid friends for the company. Such a record is particularly noteworthy when it is considered that in many well-operated utilities at least a half a day is required for the necessary office routine of approving credit, making out the order and sending it to the meter department for execution. This particular part of the operation is accomplished by the Syracuse company in just two minutes.

The service has grown out and is a part of Manager G. I. Vincent's conception of his company as a personality represented to the customer by the individual employee. In the practical application of the idea he has been assisted by Ernest Johnston, auditor, and the hearty co-operation of the entire personnel of the company. To get the proper background for the method by which these results are accomplished it is necessary first to know how Mr. Vincent visualizes his company and then hear Mr. Johnston's story of carrying out the plan. The whole idea is based upon a "Bill Jones" service which Mr. Vincent describes as follows:

### Foundation of the Service

"Once upon a time there was a little gas and electric company in a tiny village. The manager's name was unimportant, so we will call it 'Bill Jones.' Bill had two or three assistants, all told, and was the alternate for all of them. He knew everybody in town by his first name and everybody knew Bill. They were all good friends. Bill never had any trouble that he could not readily adjust and the flannel-mouthed demagogue would never have made a good start. If he tried to run down Bill or his little company, he would have been run out of town, because the folks knew Bill personally and knew he was a regular fellow besides knowing his business.

"Now, imagine the lapse of many years and that the tiny town has grown to a metropolis. With it grew its public utilities, and apparently their efficiency in operation improved, because the management was progressive, kept pace with the times, and developed high-grade men and women, trained to do their particular task in a highly efficient way. Bill Jones has long since passed on and who has taken his place? Nobody. The utility has changed from a personality to a thing. The high specialization carried with it essentially a cold-blooded adherence to routine. The customers found their

FIG. 1
WHERE THE CUSTOMER ORDERS SERVICE

FIG. 3
METER SHOP MAKES OUT "TURN-ON" ORDER

The operator at the shop makes up orders, which are transmitted by telautograph after credit has been passed. There is also shown on the right the telephone order table at which applications for gas and electric service and for complaints and notices of a leak are taken and are given direct to "Bill Jones."

requests attended to at length by a hopeless succession of workmen in their homes. True, each task might have been well done and each request in the office courteously answered, but the customer was dazed by the multiplicity of contacts, and there was confirmed in his mind the soap-box utterances that he had heard so often—that the utility was a cold-blooded, heartless corporation. The personal element was gone.

"The 'Bill Jones' idea of the Syracuse company is a sincere attempt to do in the large utility what 'Bill Jones' did in the tiny one.

"Essentially, the order-taking and order-executing departments had to be reorganized in a most revolutionary way, but that is not by any means the whole story. The idea is that each employee in coming into contact with our customers should imagine himself the 'Bill Jones' whose effort was to give the perfect and complete service and leave the customer a friend."

Such is the principle upon which the Syracuse Lighting Company is rendering a superservice and is cashing therefrom large dividends in customer friendship and good will. How it is done, from taking the customer's application to turning on the service, Mr. Johnston tells in an equally entertaining and logical manner.

### How the Plan Operates

"'Maka lights burn my house, please,' says a swarthy-looking woman to the clerk at the order counter. A crude and simple sentence, yet one which is capable of setting in motion the machinery which executes the order of furnishing gas and electric service to about 200,000 inhabitants of the city of Syracuse.

"Miss Smith, an efficient clerk, trained and advised by men who have studied carefully the situation and evolved through experience and judgment a system most satisfying to the customer, picks up her pen and commences the execution of the order.

"There are three divisions on the pad of orange-colored paper on which the application is written. The first division is the original application known as a 'turn on' and contains the date, name, address and kind of service desired, as well as the customer's signature. This may be accepted over the telephone in cases where the credit is satisfactory as readily as though the customer called at the office. When this application for service is accepted, the customer is informed that some one must be at home when the service is turned on. This is necessary in order to have the formal application signed if the request for service has been made by telephone. In case of a new customer where a deposit is required arrangements must be made through the collection department.

"The second division contains the name, address, occupation, kind of service desired and the address from which the customer is moving. This part of the application is filed according to the street and is used to follow up the completion of the work. The third division is familiarly known as a 'shut-off' notice and contains the name, address, floor, date notice is taken and date of discontinuance. The address to which the applicant is moving is also necessary so that the final bill may be forwarded to him. The 'shut-off' notice is also signed except in cases where it is accepted over the telephone.

"When these blanks are properly filled in, the order is ready to be conveyed to the various departments concerned. The vehicle of transportation is the telautograph, which makes an instantaneous record of communication between the order department, the credit and collection department and the gas-meter shop. In cases of special electric service this information is conveyed from the gas-meter shop to the electric shop by a separate instrument.

"Let us put ourselves in three places at once. The clerk in the order department writes the application on the telautograph in the manner shown in Fig. 1. This produces a visible record in three places, namely, the order department, the credit and collection department and the gas-meter shop. The credit and

SUMMARY

| | |
|---|---|
| Total number of orders | 141 |
| Orders completed 1-8-23 | 68 |
| Total time | 190 hr. 48 min. |
| Average time per order | 2 hr. 48 min. |
| C. G. I's | 17 |

collection department reads this record and immediately looks up the credit rating (Fig. 2). At the same time the operator at the shop is making a copy of the order (Fig. 3). It is now the collection department's move, and it shows by means of a code symbol written on its machine whether the credit is O. K. or if a deposit is required.

"At this point, in order to speed up the passing of credits, it was necessary to revise the method of keeping these records as the company has on its books approximately 80,000 gas and electric accounts. Accordingly, a card index was made of all accounts on which a deposit would be required or the credit was doubtful. This file of dubious accounts numbers about 5,000, so that the credit department in looking up the rating of an applicant simply consults these cards and if the customer's name is *not* found the credit is approved at once. From this it should not be assumed that the company has 5,000 bad accounts, for the index includes the names of many people who have moved out of the city or whose accounts for some reason have become inactive.

"Any information that any one of the three places concerned desires can, of course, be obtained by writing on the machines, which will reproduce a record in the same manner as above described. A typical telautographed order is shown in Fig. 4.

"When the credit has been properly established, the order is given to 'Bill Jones' to execute. We usually associate the name of 'Bill Jones' as that belonging to the eighteen men whose duty it is to fill these orders of 'turn on' and 'shut off,' as well as those dealing with complaints, etc. However, all employees coming in contact with the public consider themselves individually as 'Bill Jones.' That is, they are to feel personally interested in each case coming to their attention and do all they can to see that the customer is properly satisfied. The speed with which the orders are carried out can best be illustrated by a story which these men tell.

"Mrs. J—— of Tompkins Street came into the office of the Syracuse Lighting Company on Tuesday morning at 10:15 o'clock and made application for gas and electric service at her home. The clerk took her application and completed all arrangements with the parties concerned. At 10:17 Mrs. J—— left the office. She boarded a street car and upon arriving at her home at 10:40 met a man just leaving her house to enter a Ford roadster standing at the curb. She looked inquiringly at him, and he asked if she were Mrs. J——. When she answered in the affirmative, he said:

" 'I'm from the Syracuse Lighting Company and am here to turn on your gas and electric meters.'

" 'What!' said Mrs. J——. 'Why, I just signed for it.'

" 'Bill Jones' grinned: 'I'll say that's service.'

"Most gas and electric companies agree that if an order is executed in from one to three days after its receipt it is good work. We are doing it in less than three hours.

"Statistics are always convincing, and we therefore use this method to back up the statement that we found it possible by means of the telautograph instrument and the 'Bill Jones' organization to reduce the time from days to hours. A record was kept by placing the time of receipt on each application written on the telautograph and having 'Bill Jones' note on his order the time it was completed.

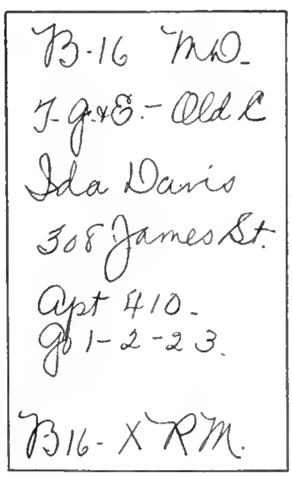

FIG. 4—TELAUTOGRAPHED SHOP ORDER

"What was the result? The average time required to secure gas and electric service was not two or three days, but two hours and forty-eight minutes. In order that it may be understood just how this test was made, there is shown also a detailed analysis of some of the orders taken during the test.

"Cases are constantly coming up which show how well this system works. Take the case of Mr. B——, for instance. Mr. B——, a resident of another city, came into our office at 9:50 in the morning and wanted his gas and electricity turned on at 308 James Street.

" 'Say, have it done as soon as you can, will you?' Mr. B—— said. 'I've got to take the wife and babies down to dinner today, and it's an awful nuisance getting them all dressed and lugging them back and forth on the street car.'

" 'Will noon be all right, Mr. B——?' the clerk asked.

" 'Noon? Sure! When?'

" 'Why, today.'

"Mr. B—— smiled. 'Well, that's good news, if it's true,' he said and walked out of the office.

"At 11:15 Mrs. B—— called up the office to tell us that her service had been turned on and to thank us for the prompt and considerate treatment she had received. She even brought the baby to the telephone and let him say, 'Thank you.'

"This is an actual case taken from our records, but it is in no sense a test case. It is only one of thousands which the company handles each year in its effort to perform its work efficiently and in the shortest possible time."

## Estimated Income from Appliance Sales at Providence

LAST year's sales of appliances in the electric shops of the Narragansett Electric Lighting Company, Providence, R. I., will add an estimated annual income from the use of electricity totaling $109,465. Through the courtesy of Arthur B. Lisle, general manager of the Narragansett company, the accompanying schedule of appliances sold, together

REVENUE FROM ENERGY CONSUMPTION OF APPLIANCES SOLD IN 1922

| Appliances | No. Sold | Income per Appliance | Estimated Yearly Income |
|---|---|---|---|
| Fireless cookers | 17 | $6.00 | $102.00 |
| Chafing dishes | 24 | 2.00 | 48.00 |
| Hair dryers | 28 | 3.00 | 84.00 |
| Drills | 10 | 6.00 | 60.00 |

| Thermolites | 24 | 3.00 | 72.00 |
| Vacuum cleaners | 2,214 | 3.60 | 7,970.40 |
| Vibrators | 227 | 3.00 | 681.00 |
| Clothes washers | 474 | 3.60 | 1,706.40 |
| Dish washers | 13 | 6.00 | 78.00 |
| Portable lamps | 4,768 | 6.00 | 28,608.00 |
| Rectifiers | 72 | 12.00 | 864.00 |
| Total income | | | $109,465.80 |

with the estimated yearly income, is published.

A. H. Allcott is manager of electric shops, of which there are seven in the company's territory. While the company's merchandising operations are conducted to show a profit on sales sufficient to cover all expenses including overhead, the primary object is to increase the use of energy by residential customers. From the tabulation it will be noted that portable lamps and flatirons exceed all other single items, while vacuum cleaners are third.

## Electric Range Demonstrated to Rotary Club

THE accompanying cut shows the members of the Rotary Club of Boulder, Col., as guests of C. A. Semrad, general manager of the Western Light & Power Company, at an electrical luncheon served in the turbine room of the company's Lafayette plant, 12 miles from Boulder. The luncheon was prepared entirely on electric ranges as a practical demonstration of their commercial application.

Three electric ranges were installed at the plant especially for the occasion by E. B. Ball, commercial manager, and M. E. Lanning, of the Westinghouse company in Denver. The latter did the cooking, starting the night before in order that oven space might be available immediately prior to serving the meal. The seventy-five Rotarians pronounced the luncheon one of the best ever attended by their club.

Mr. Lanning, having thus established his culinary qualifications at Boulder, is preparing to feature a similar demonstration at Pueblo in conjunction with the Southern Colorado Power Company.

## Three Arguments for Better Window Lighting

There are three outstanding conditions which are influencing merchants to adopt higher standards and intensities of illumination in their display windows, declared J. R. Colville of the National Lamp Works of the General Electric Company, before a meeting of the Philadelphia Section of the Illuminating Engineering Society recently. First, the high investment cost of window space, the high pay of window trimmers and the increase in the habit of "window shopping" by passers-by have caused storekeepers to do everything possible to attract attention to their displays. Second, the increase in intensity of street illumination has forced merchants to raise that of window lighting. Third, the drawing power of window lighting in the daytime is becoming better appreciated and the use of artificial illumination in daylight hours is growing.

Another development in the store-window lighting, Mr. Colville pointed out, is the elimination of street reflections by the use of very high intensity illumination. Typical instances have been the use of flood and spot lights where the value of the light on the floor or object displayed is between 3,000 and 4,000 foot-candles.

ROTARY CLUB LUNCHEON AT WESTERN LIGHT & POWER COMPANY'S PLANT

## What Other Companies Are Doing

**Pueblo, Col.**—Although of short duration, the display of a model electrical home here attracted 6,000 visitors. It was open from March 14 to 18, and on the last day of the exhibition nearly 2,000 people were turned away. Because of its success plans are now being made to feature another electrical home during the summer months, with the aid of the Electrical Co-operative League in Denver.

**California.**—Members of the Edison Road Show Company, a good-will producing unit of the Southern California Edison Company, recently entertained the residents of Redlands with the show, which deals with the development of hydro-electric power in California. Experiments with high-voltage current were also performed for the guests of the company.

**Springfield, Ill.** — Merchandise sales of the Central Illinois Public Service Company for the third week in March totaled $15,048, which is next to the largest weekly sales the company has made, the high record this year being in January. The January sales exceeded those for the same period in 1922 by 31.4 per cent. The February sales over the same period were greater by 128.1 per cent. The combined sales for the first two months of this year were 73 per cent greater than for the same period in 1922.

**Roswell, N. M.** — An electrical apartment will shortly be exhibited to the residents of this city as the result of an arrangement between the Roswell Public Service Company and the electrical contactor-dealers. The apartment to be used is that of Carl M. Einhart, general manager of the central-station company. Although no electrical homes have been shown thus far in New Mexico, the movement is under way and other displays will be made in the late spring following the Roswell exhibition.

**Hartford, Conn.**—To meet the convenience of three thousand local customers, the Hartford Electric Light Company will shortly establish its first branch office in East Hartford, under the resident managership of John Garrett. All business formerly handled at the main office in Hartford can be covered at the new location.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Power Direct from Sunlight.*—TITO ROMAGNOLI.—The theories of all present-day projects for getting power direct from sunlight are treated and illustrated in this article.—*Elettrotecnica*, Jan. 5, 1923.

*Loss of Head in Valves and Pipes.*—C. I. CORP and R. O. RUBLE.—The results of 2,200 tests on forty-eight different gate and globe valves are presented in this bulletin. Results of 425 tests to determine pipe friction are also included. The loss of head due to gate valves ½ in. to 12 in. in diameter was measured for various openings, namely, one-eighth, one-quarter, three-eighths, one-half, three-fourths and fully open. The loss of head due to globe valves ½ in. to 2 in. in diameter was determined under fully open conditions. As a part of the valve experiments the loss of head in pipes of ½-in. to 12-in. diameter was determined, and these results are included in this bulletin. The article is 143 pages long and includes a description of all of the tests, apparatus, methods of experimentation, results and numerous tables of data. There are twenty-two tables giving the loss of head in pipes, gate valves and globe valves.—*Bulletin of the University of Wisconsin, Engineering Series*, 9-1.

## Generation, Control, Switching and Protection

*Experiences with Lightning Arresters in South Africa.*—H. BOHLE.—Very little protection against lightning disturbances was obtained on overhead lines with but one grounding cable above the wires. Three of such cables fastened to a top cross-arm gave fair protection to a three-phase double line, but only in the case of high-frequency discharges. Grounding of the neutral Y-point over large water resistances (water boxes) was effective only if the three phases carried a balanced load. An unbalanced load of as much as 5,000 kva. was found occasionally. In this case the grounding of the Y-point may be a voltage grounding, but not a current neutral grounding, and it is therefore useless. Arcing horns proved to be of no value in South Africa on account of their time lag, during which transformer puncture occurred. The resistance in series with such horns limits the ground current usually to about 15 amp., but as high as 1,000 amp. induction currents will occur frequently. It was observed that buses with well-rounded corners flashed over, while nearby horn gaps set much closer did not function. The sphere gap of the General Electric Company showed in actual service a much smaller time lag and gave results superior to the horn gap. Aluminum arresters give a better performance than other arresters, but necessitate daily charging and have, together with lead-peroxide arresters, the common disadvantage of all spark gaps. Neither of these arresters represents, therefore, a definitive method of protection from lightning.—*Zeitschrift des Vereines Deutscher Ingenieure*, March 3, 1923.

*Studying the Motion of Relays.*—H. E. IVES and T. L. DOWEY.—In the study of the electrical phenomena accompanying the making and breaking of contacts for relays it is of considerable importance to know definitely how the contact points move relatively to each other. Apparatus is described for photographing the motion of relay points, the shadowgrams of which give information on the performance of the relays, while accurate measurement of the films opens the way for quantitative analysis of the motion.—*Bulletin B-10-1 of the Western Electric Company.*

## Transmission, Substations and Distribution

*Problems of Parallel Operation of Transformers.*—E. WIRZ.—In the theoretical part of this article the author proves that for a perfect parallel operation of transformers not only the same reactance of the two machines is required, but that they also should have the same no-load characteristics. In the second part, which deals with test results to verify the theoretical conclusions, it is shown that transformers with disk coils lend themselves better to a perfect parallel operation than those with barrel or cylindrical windings, and that in the case of operating two transformers in parallel, where the one is built with disk coils and the other with barrel coils, the disk-coil machine should have a smaller reactance. Vectorial analysis is used throughout the theoretical part of the paper. The tests were made on 150-kva., three-phase transformers.—*Bulletin Association Suisse des Electriciens*, January, 1923.

*Lightning Disturbances on Distribution Circuits.*—M. MACLAREN.—A general survey is presented of the nature and distribution of failures and interruptions due to lightning upon the circuits of the Philadelphia Electric Company. Recommendations are given for improving conditions without specifying any particular make of arresters, in recognition of the fact that a considerable number of different types are proving adequate to meet the conditions imposed upon them on the moderate-voltage systems under consideration. The subject is treated under three principal divisions—115-230-volt distribution circuits, 2,300-volt circuits and 13,200-volt circuits. The number and the nature of the failures on each of these three systems are discussed.—*Journal of the A. I. E. E.*, March, 1923.

*An Integral Equation for Skin Effect in Parallel Conductors.*—CHARLES MANNEBACK.—The author has obtained the general set of integral equations giving the theoretical solution of the current distribution in parallel conductors by the method of successive approximations. This method is particularly advantageous in giving the approximate solution of skin-effect problems at low frequency for parallel conductors of any shape and number. A physical interpretation of the successive approximations is made. The integral equations as developed may also be used as a check on solutions obtained by other processes. — *Publications of the Massachusetts Institute of Technology, Serial No.* 30.

*Economy of Cooling Methods for Large Transformers.* — H. SCHULZE.—Only two methods of cooling large power transformers are being considered today in Europe. In one of these methods the hot oil from the transformer is pumped through an oil-pipe system, over which a shower of water is directed. Being arranged within a cooling tower, the same water is used over and over again. The method requires one oil pump and one water pump. The second method dispenses with water entirely and directs a powerful blast of air across the oil-pipe system, requiring one oil pump and one air blower. Experiences obtained on the 100,000-volt transmission systems of Germany have shown that the second method, in spite of its higher initial cost, is more economic and reliable in operation, particularly where the water conditions are not fully perfect as when only impure or carbonated water is available. The heated air, after leaving the oil-pipe system, can be and is being used advantageously to heat the operating rooms of the station or substation, whereas with the first-mentioned method a special steam-heating plant has to be provided. The author gives a detailed cost comparison of these two methods for a station with two 7,500-kva. transformers. The installation costs compare in the ratio of 100 to 117 respectively, but the operating expenses are as 100 to 90, resulting in a saving of approximately 10 per cent.—*Elektrische Betrieb*, Feb. 24, 1923.

## Units, Measurements and Instruments

*A Direct-Reading Thermionic Voltmeter and Its Applications.* — E. B. MOULLIN.—The conditions suitable for constructing a sensitive direct-reading voltmeter from a triode rectifier are discussed and two distinct forms of completed thermionic voltmeters are described. The power absorbed by a rectifier is discussed theoretically, and a description is given of the experimental

methods of measuring the effective resistance of a thermionic voltmeter. Possible causes of frequency errors in the calibration of the voltmeter are considered and the results of experiments are quoted, showing that a calibration made at low frequencies is reliable up to at least one million periods per second. Several typical illustrations are given of the uses of a thermionic voltmeter in measurements at both high and low frequencies.—*Journal of the Institution of (British) Electrical Engineers*, February, 1923.

*History of Electric Meters.* — W. STUMPNER.—The article deals in a general descriptive manner with the development of the direct-current amperehour and kilowatt-hour meters, embracing the chemical, electromechanical and motor principles. Except for a description of a few thrust-bearing constructions, only a few technical details are given in the paper, the main interest of which lies in its many illustrations.—*Siemens Zeitschrift*, February, 1923.

*Maintaining Small Objects at a Constant Temperature.*—P. P. CIOFFI and L. S. TAYLOR.—An apparatus for maintaining small objects at any temperature between —180 deg. C. and +20 deg. C. is described. The method consists in surrounding the object to be cooled by a stream of cold, dry air, while keeping any surfaces exposed to the free atmosphere above 0 deg. C. The cold, dry air is obtained by evaporating liquid air in a Dewar flash by an electric heater immersed therein.—*Bulletin B-18-1 of the Western Electric Company.*

## Motors and Control

*Electric Drive in Steel Mills.* — A. RUSCHOWY.—A general description of a great variety of modern electric installations in steel mills, comprising gas-driven central stations, rolling-mill motors, coal-conveying plants, Ilgner flywheel sets, Leonard motor-generators and a 13-ton induction furnace installation of the Frick type. The paper is well illustrated with machines built by three of the largest European manufacturers.—*Elektrotechnik und Maschinenbau*, Feb. 18, 1923.

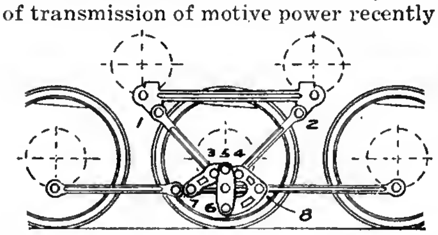
*Electric Heating for a "Shrink Fit."* —A. GANDENZI. — To fasten securely the shaft of a 4,000-kw. rolling motor into its large rotor casting a "shrink fit" was decided upon. The necessary shrinkage was calculated to from 0.5 mm. to 0.6 mm., requiring the heating of the bulky casting to about 200 deg. C. to 220 deg. C. To accomplish this without undue loss of time and with greatest accuracy, electric heating was resorted to, using alternating current in a few turns of cable around the rotor hub as a short-circuited secondary. A number of calibrated thermocouples, placed at different points on the hub, measured the rising temperature during the process. The job was successfully finished in sixteen hours, consuming 50 kw., of which 3½ kw. were the copper losses in the cable.—*Brown-Boveri Mitteilungen*, March, 1923.

## Electrophysics, Electrochemistry and Batteries

*Production of Nitric Oxides and Ozone by High-Voltage Electric Discharges.*—K. B. MCEACHRON and R. H. GEORGE.—A bulletin of 189 pages presenting the results attained in investigating various types of tubes to which electrical discharges are confined. The material presented is grouped under four general heads, corresponding to the type of tube employed and classified as the Siemens tube, the rod-type tubes, the single dielectric tube and tubes using spark discharges. All these tubes are described in detail in connection with the tests made with them. As a rule several tubes of the same type were tested, and the results serve to show the effect of changing the size of the parts or of constructing the tube of the same dimensions but of different pieces of the same material. Except in the case of the Siemens type, the effect of varying air-flow rate, pressure and voltage and current were studied. A special study of high-voltage alternating-current discharges has been made in working on the fixation problem. Some conclusions are given which may aid in the formulation of a theory of the reactions of the corona discharge.—*Bulletin No. 9 of the Purdue University Engineering Experiment Station.*

## Traction

*Articulated Connecting Rods for Electrical Locomotives.*—G. BIANCHI.—The author describes the new system of transmission of motive power recently



ARTICULATED CONNECTING RODS APPLIED TO HIGH-SPEED ELECTRIC LOCOMOTIVES

applied to a high-speed electric locomotive built for the Italian State railways. This system has the advantages of being much lighter than the old arrangement and of transmitting to the drivers the horizontal components only of the efforts at the cranks of the motors. Points 1 to 8 of the accompanying illustration show where the articulations have been made. The design of the system is briefly treated and general considerations are given.—*Elettrotecnica*, Vol. 9, No. 33.

*Development of Mercury-Arc Rectifiers*—A. ODERMATT.—The writer compares the rectifier with a stationary commutator around which the arcs circle as brushes, without mechanical inertia or friction and with the speed of the frequency. The originally somewhat wavy character of the resulting direct current can be easily smoothed out with properly dimensioned iron-core choke coils. The latest Brown-Boveri constructions of rectifiers are described in the paper with several photographs of recent installations. A rectifier shows an efficiency of its cylinders of 96 per cent operating on 500 volts, 98 per cent operating on 1,000 volts and 99 per cent operating on 2,000 volts. For a substation of, for example, 200 kw. output with an average load of 80 kw. the following over-all efficiencies may be obtained: Motor generator, 70 per cent; rotary converter, 83 per cent; mercury-arc rectifier, 94 per cent. Good comparisons were obtained from actual meter readings in a substation for an 850-volt direct-current suburban railway, operating once with rotaries and once with rectifiers. At 1,042 kw.-hr. delivered to the road the rectifier consumed 1,110 kw.-hr., while the rotary consumed 1,203 kw.-hr., or a saving of 93 kw.-hr. per day. Assuming a cost of 10 centimes per kilowatt-hour, a yearly saving of 3,390 francs, or 10 per cent of the cost of the rectifier, was realized. A rotating rectifier plant may therefore be replaced by a mercury rectifying plant practically without cost, the latter paying for itself by its much more economic operation.—*Elektrotechnik und Maschinenbau*, March 4, 1923.

## Telegraphy, Telephony, Radio and Signals

*Acoustic Efficiency of Thermophones of the Heated Foil or Wire Type.*—E. C. WENTE.—Theoretical formulas are derived for the maximum value of the alternating pressure produced within the inclosure of any thermophone when a given alternating current, superposed on a direct current, is passed through the central foil or wire. The effect of certain simplifying assumptions which are made is shown to be small in practical cases. As an experimental verification of the formula, an electrostatic transmitter was calibrated for a wide range of frequencies with four thermophones which differed greatly in their physical constants, the formulas being used to compute the pressures produced. The four calibrations thus obtained agree with each other closely and also with an independent calibration made with a pistonphone.—*Bulletin B-6-1 of the Western Electric Company.*

*Signaling Increases Capacity of Three Tracks.* — Automatic signaling and interlocking plants will play an important part in handling the traffic on the 21-mile stretch of third track now nearing completion on the Illinois Central between Monee, Ill., and Kankakee. The outstanding feature of this installation is the fact that the routing of trains on the three tracks is left to the towermen, conflicting moves on the middle track, which is signaled for both directions of traffic, being prevented by electrically interlocked circuits between the towers. The two outside tracks are signaled for the normal direction of traffic, while the middle track is signaled with one-mile blocks for both directions of traffic. The track layouts and crossovers are so arranged that a towerman can divert a train from either outside track to the center track or the reverse.—*Railway Age*, March 3, 1923.

# New Books

Reviews of the Latest Contributions to Technical, Industrial and Commercial Literature of Particular Interest to Members of the Electrical Industry

## The Induction Voltage Regulator

By E. F. Gehrkens. Schenectady, N. Y.: General Electric Company. 516 pages, illustrated.

The induction regulator is a valuable and essential device on large systems, and the author has presented the theoretical and practical aspects of regulator design and application in a splendid manner. The general operating and design principles are discussed, and yet the major portion of the book treats of the applications of the various types of regulators. The auxiliary equipment used is also discussed and explained. This volume should prove very helpful to operators who use the regulator, to students and to those who desire to study the device in all of its detail.

## Electricity and Its Application to Automotive Vehicles

By P. M. Stone. New York: D. Van Nostrand Company. 844 pages, illustrated.

The electrical features of the automobile have become necessary and valuable adjuncts to the mechanical equipment. But the confined space in which the electrical apparatus is contained, its own character and the rapid developments in the art usually make it difficult for the owner or mechanic to master the workings of the equipment. In this book a teacher in an automobile school has written down in text form the fundamental principles of electricity and then applied them to the operation and installation of automotive electrical equipment. A judicious exercise of theory and practice has resulted in a valuable book for car owner, mechanic or student. Among its commendable features are the chapters devoted to "Trouble Shooting," "Testing" and "Splicing and Soldering."

The book is well illustrated and contains drawings and descriptions of representative installations. It is an excellent addition to the automotive text series.

## Relativity and Space

By C. P. Steinmetz. New York: McGraw-Hill Book Company, Inc. 126 pages, illustrated.

The versatility and deep knowledge of Dr. Steinmetz are well proved by the four lectures contained in this volume. He has made a very successful explanation of the meaning of relativity for the lay mind by using analogies and the synthetic method of attack. Even though the relativity theory cannot be grasped completely without the use of mathematics of higher degree, Dr. Steinmetz has brought out the philosophy, the science and a great deal of the physical meaning of the theory. The book contains some mathematics of a simple type to illustrate more accurately certain of the conceptions involved in relativity. The last lecture is devoted to the conception of mathematical space and exemplifies the power of thought, the lucid expression and the logical analysis for which Dr. Steinmetz is noted. This is a worthwhile book for all engineers interested in a fascinating subject.

## Ultra-Violet Radiation

By M. Luckiesh. New York: D. Van Nostrand Company. 258 pages, 12 plates.

It is a remarkable fact that, despite the great amount of research which has been spent on ultra-violet radiation and its importance both theoretically and practically, no book dealing with the subject has appeared since the little volume of Prof. S. P. Thompson a good many years ago, when knowledge of the subject was scarce. Mr. Luckiesh has done a real favor to the engineer and the investigator by gathering together with no little patience and much discriminating judgment many data on the ultra-violet and its properties. He first acquaints the reader with the nature and history of the subject and then takes up in turn solar radiation, the transparency of gases, liquids, solids and glasses, the reflection of the ultra-violet by various substances, its occurrence in common illuminants, the experimental sources for such radiation, its detection and measurement, and its physiological and photo-chemical effects. The treatise thus forms an extremely useful summary of the present state of knowledge of fundamental facts regarding short-wave radiation, the more valuable in that it is provided with very full bibliographical notes. Mr. Luckiesh makes no attempt to deal *ex-cathedra* with moot problems, but sets out in his usual effective and interesting way the things which are known, leaving disputed questions to be dealt with by reference to the original papers.

The data on transmission and reflection of the ultra-violet, which are given somewhat fully, will be found most convenient for the investigator, who will discover assembled here data which would take him long to dig out of the somewhat scattered literature of the subject. One may, in fact, say without exaggeration that here is a book that should be at the elbow of any one who is working or expecting to work on the ultra-violet region of the spectrum. Science certainly owes Mr. Luckiesh a debt of gratitude for having gone to the pains to put so effectively a great mass of facts ready to its hand.

Louis Bell.

## Schaltungen von Gleich und Wechselstrom Anlagan

By E. Kosack. Berlin: Julius Springer. 155 pages, 226 illustrations.

Books of this character are usually a collection of more or less monotonous wiring diagrams with the necessary text, all reference to auxiliary apparatus being omitted. The author has carefully avoided this fault by using as examples the diagrams of plants in actual operation and omitting calculations wherever possible in order to reduce the mass of material to the dimensions of a much condensed volume. Very plain diagrams, conforming to the latest rules of the Vereines Deutscher Ingenieure, are used throughout the book. Its ten main sections are devoted to connections for switches and protective apparatus, lamp wiring, measuring instruments, direct-current plants, direct-current motors, alternating-current plants, transformer stations, alternating-current motors, connections of substations with rotating apparatus like motor-generators, rotaries, cascade groups, etc., and, finally, starting and regulating devices. The progress made in late years in Europe through the mercury-arc rectifiers, which have become in many instances serious competitors of rotaries or motor-generators, is not made manifest in the scant two-page treatment of their connections.

A. Palme.

## Promote Superpower Plan

**Superpower Advisory Board and the F. A. E. S. to Act in Concert on Atlantic Coast Project**

A LEGAL committee headed by Edward G. Buckland, general counsel of the New York, New Haven & Hartford Railroad and a member of the Superpower Advisory Board, will ascertain in the near future what state laws interfere with the building up of a superpower system on the North Atlantic Coast and what legislation is necessary to bridge over these laws. The Federated American Engineering Societies will co-operate with the Superpower Advisory Board in an effort to revive activity looking to the practical application of the plan. It is believed that the time is particularly opportune since the earnings of railroads and utilities now are such as to justify improvements of an electrical character which, because of reduced earning power, could not have been undertaken at the time the superpower report was made. It is believed that earnings during this peak of business activity had better go into improvements requiring large capital but making for ultimate economies rather than allow rate reductions to be made on the basis of present earnings.

### Letter to Governor Smith

As one of the uncertainties in the superpower situation at this time is the attitude of the Governor of New York toward the plan, L. W. Wallace, the executive secretary of the Federated American Engineering Societies, has addressed the following letter to Governor Smith:

"The engineering profession is very much interested in seeing secured for the public the economies and benefits which would follow the building up of a superpower system in the Boston-Washington area. I am wondering if the superpower plan proposed for this area would conflict with your policy. The advantages to New York, I believe, would be many were resort had to greater interconnection. So far as New York is concerned, it probably would be largely a matter of importing power. Exports of energy would be confined largely to offpeak loads, which would make possible uniform operation of plants in New York.

"I am not attempting to present the advantages and disadvantages of the superpower system. I am not willing to conclude before learning your opinion that you would oppose such a system or would object to New York's consideration of a compact between the states concerned which would make uniform the regulation of such a utility. I shall be grateful to you indeed if I may have your thought on the foregoing points."

## For Adams-Albany Line

**Harriman Outlines Value of This Interstate Tie—Pittsfield Company Withdraws Opposition**

MARKED benefits in the utilization of streams with diverse flowage characteristics, coupled with more effective operation of steam plants, will result from the interconnection of the New England Power Company's system with that of the Adirondack Power & Light Company, declared H. I. Harriman, president of the former company, at a recent hearing before the Massachusetts Department of Public Utilities upon a petition for authority to issue securities to finance this and other improvements. It is proposed to build a transmission line across western Massachusetts from Adams to Albany, N. Y., permitting flexible operation of the hydro-electric and steam stations on each system. Mr. Harriman pointed out that while the great seasonal variations in flow are synchronous on the watersheds of the two systems, the intermediate variations are asynchronous and susceptible to more efficient utilization through tie-line operation. Coal costs from $1.50 to $2 per ton less at the Amsterdam (N. Y.) steam plant of the Adirondack company than on the New England system, and the former has recently contracted with the International Paper Company for 40,000 kw. more water power. Completion of this interconnection will effect electrical solidarity from Boston to Utica.

### Pittsfield Company Withdraws Opposition

During the hearing the Pittsfield (Mass.) Electric Company withdrew opposition that it had exerted against the New England company's petition in view of the latter's withdrawal of its projected Lanesboro substation in the Pittsfield district, and upon the understanding that the construction of the Adams-Albany tie line would be for trunk-line interconnection purposes and not for the supply of local loads within the Pittsfield company's area of service. The early interconnection of the latter with the Turners Falls Power & Electric Company's system, it was set forth, will insure ample power supply to the Pittsfield district as future business develops.

## Superpower in Northwest

**Survey Committee for Upper Pacific Coast Finds No Present Need for Ambitious Plan**

A CAREFUL study of power conditions in the Pacific Northwest has just been completed by the Superpower Survey Committee organized two years ago, as reported in the ELECTRICAL WORLD for April 30, 1921, page 1008. D. C. Henny of Portland, Ore., was the chairman of this committee, and it included representatives of electric light and power, railroad and commercial companies in Oregon, Washington and Idaho. The committee reports that the situation in regard to developed water power as well as feasible undeveloped sites is so favorable throughout the Northwest that there is no need at present of a superpower line. Present inter-tie lines of medium capacity, it holds, make ample provision for the comparatively small interchange of power necessary from one district to another and for reasonable insurance against service interruption.

## Final Plans for Pittsburgh Meeting of A. I. E. E.

An important group of papers covering the vital phases of the grounding of transmission systems will, as already announced in the ELECTRICAL WORLD (March 31, page 767), be presented and discussed at the spring convention of the American Institute of Electrical Engineers, which will be held in the William Penn Hotel, Pittsburgh, on April 24 to 26 inclusive. The report of the sub-committee on grounding of systems will analyze the practices used for transmission of more than 6,000,000 kva. of energy over 30,000 miles of transmission lines at voltages up to 150,000. This report will show very wide divergence in practice, for, while grounding the neutral prevails, a number of important systems are still operating ungrounded. Although the use of resistance in the grounding circuit is becoming increasingly common, the value of such resistance shows no uniformity, according to the report, which will also show that the Peterson coil used on one system has a very creditable record. A deviation has been made from the program as printed on March 31 in that W. W. Woodruff, Philadelphia Electric Company, will handle the report on "Systems Transmitting at Generated Voltage" and E. C. Stone, Duquesne Light Company, the report on "Systems Transmitting at Higher than Generated Voltage."

The banquet to be held on Wednesday evening will be of unusual importance as a meeting. President Jewett will preside, and the speakers will be Philip P. Wells, who will represent Governor Pinchot of Pennsylvania, and Paul T. Brady of the Westinghouse Electric & Manufacturing Company. They will discuss "Superpower—a National Resource."

E. C. Stone, Duquesne Light Company, chairman of the Pittsburgh Section, American Institute of Electrical Engineers, is chairman of the general committee in charge of arrangements for the convention. Engineers expecting to attend the convention are requested to communicate with W. C Goodwin, chairman committee on registration, in care of the control engineering department, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., at the earliest possible moment in order that convenient hotel accommodations may be secured.

## Ten-Million-Dollar Plant for Houston

It is announced by Edwin B. Parker of Houston, Tex., president of the Houston Lighting & Power Company, that that company will immediately construct the first unit of an electrical generating plant. This unit will cost $4,000,000. The plant will ultimately be the largest in Texas and will entail an expenditure of $10,000,000. Excavation for the building has already been started. It will be built on a 98-acre tract of land, fronting 1,200 ft. on the Ship Channel, owned by the company. The equipment of the first unit will be two turbo-generators, each of 20,000 kw. rating. The construction of three additional units of 40,000 kw. rating each is planned, bringing the total ultimate production of the new plant to 160,000 kw.

"The idea in the minds of the executives of the Houston Light & Power Company," said Mr. Parker, "is to build ahead of the probable needs of the city. Then, as the needs increase, the facilities of the Ship Channel plant will be added to from time to time until the four units are completed. The new plant will be maintained independently of the present plant, which will be used as an emergency plant. At present there is a demand for 5,000 kw. in the immediate vicinity of the proposed plant on the Ship Channel. The remainder of the energy will be transmitted to the present plant over two cables, one on the north and one on the south side of the channel. Each transmission line will be capable of carrying the entire load.

"The present capacity of the company's plant is 32,500 kw. This will be increased by the power from the channel plant by 35,000 kw. upon the completion of the first unit. The turbines are being built by the General Electric Company and will be ready for installation as soon as the building is completed, which will be in about twelve months."

## Explosion in Indianapolis

### Turbo-Generator in Mill Street Power House Is Blown to Pieces and Building Damaged

A LOSS estimated at $1,000,000 in damage to machinery and interruption of service was caused, two men were hurt and light and power service over most of the city was paralyzed about 5 a. m., Monday, April 2, when a 12,500-kw. steam-electric turbine in the Mill Street plant of the Indianapolis Light & Heat Company exploded. Pieces of the giant turbine were thrown in all directions, and the interior of the engine room at the plant was wrecked. Two other turbines were temporarily put out of commission. Fire started and an alarm was sent in, but at no time did it assume serious proportions.

The turbine was on a slightly raised platform in the north end of the engine room at the plant, which is a three-story brick structure. One piece of the unit wrecked traveled the length of the plant and crashed through a window at the south end, a few feet beneath the eaved roof. Other pieces crashed through windows nearer the wrecked turbine. Holes were torn in the roof.

#### PROMPT RESTORATION OF SERVICE

Officials expect soon to have a 19,000-kw. steam turbine in service at the plant to supplement the 5,000-kw. and 19,000-kw. turbines which have been restored to service and now bear the load there. While all demands on the plant are being supplied, the explosion created a situation in which it has had to operate the two turbines now in use beyond their rating. Addition of the extra turbine will relieve the strain. Experts say repair of the turbine that exploded is virtually impossible.

Despite the extensive damage done by the explosion, officials of the Indianapolis Light & Heat Company, are going ahead with plans for the year's development work, according to a statement made by President C. C. Perry. The only change in the program, Mr. Perry said, was to include greater generating equipment for the two large central power stations owned by the company, so that in event of another accident the ordinary light and power load can be taken up and served by the remaining station. This change in development plans calls not only for the installation at the Mill Street plant of the 19,000-kw. turbine just mentioned to take the place of the generator destroyed, but also of another turbine of the same capacity for the Kentucky Avenue plant. When all the equipment ordered has been installed the company will gain an increase in generating capacity of about 35 per cent.

## Public Service Electric to Build Superplant

Plans have been completed by the Public Service Corporation of New Jersey for the erection near Newark of a superpower steam-electric generating station with an initial installed capacity of 200,000 hp. and an ultimate capacity of 400,000 hp. Construction will begin soon. The new station will be interconnected with the Public Service Electric Company's system, and power will be distributed through the densely populated industrial sections of New Jersey, where the demand for energy exceeds the supply. Electricity is now supplied to 337,500 customers in 202 communities. The new installation when completed will bring the Public Service Electric Company's total generating capacity up to 720,000 hp.

HAVOC WROUGHT THROUGH BURSTING OF TURBO-GENERATOR IN INDIANAPOLIS POWER HOUSE

## Rural-Service Charges

### Discussion Before Indiana Commission on Rate Including Percentage of Equipment Cost

AT A RECENT hearing by the Public Service Commission of Indiana on proposed rules for the extension of electric utility service into rural territory, much attention was given to a proposed additional rate to be paid for energy for rural service as compared with the rate in the city from which extensions are made, this additional charge to equal 10 per cent of the total cost of the general and local equipment included in each separate extension. E. J. Condon of Angola said that in view of the fact that the farmers are to pay for the cost of the extension, including general and local equipment, it would be difficult to explain to them why an additional rate of 10 per cent of the cost of such equipment should be added to their bills every year. Roy Thurman of the Indiana General Service Company, which had submitted the proposed rules, answered that the 10 per cent was to take care of depreciation, taxes and excess maintenance cost of rural over city lines.

H. A. Nichols of the Union Traction Company submitted that the 10 per cent addition to the rate, on the basis proposed, would make complicated bookkeeping. He thought it would be better to establish a minimum monthly charge of about $2.50 a month and add about 25 per cent to the bill to cover the extra costs of rural service. A farmer or a group of farmers would pay for the general and local equipment, and title would rest in the utility company.

The utility men present took the position that it would be of no advantage to them to have title to property that had been paid for by the farmers, and that such title would be a liability rather than an asset, because the utilities would have to pay taxes and maintain the property. Commissioner Ratts, who presided, said that placing title in the utilities would result in better maintenance.

In the rules as first proposed for adoption 10 per cent to cover contingent expenses, cost of accounting and other items and 10 per cent to cover engineering supervision and the use of tools were added to the actual cost of equipment for an extension. It was said by some of those present that farmers would object to these charges, and Earl Carter, chief engineer of the commission, suggested that the actual engineering and supervision costs in dollars be included in the cost of equipment and only one 10 per cent be added, this to cover contingent expenses and cost of accounting.

## Civil Engineers Vote Not to Join F. A. E. S.

By a vote of approximately 3,600 to 2,100, the American Society of Civil Engineers has again decided not to join the Federated American Engineering Societies. This vote proceeded during the month of March, closing on April 1, and was canvassed April 6. This question has been a very live one with the civil engineers and briefs pro and con have been widely circulated. The feeling among other engineers is one of regret, with the belief that the civil engineers have not fully comprehended the opportunity for service by means of the F. A. E. S. organization.

## Italy Turns Back Telephones to Private Hands

A decree whereby the telephone systems of Italy, heretofore a government monopoly, are to be turned over to private industry and completely reorganized has been issued, in accordance with previous announcement, by the Italian government. Under this decree, the government, by virtue of its grant of full powers in administrative matters from Parliament, may grant to public or private companies or individuals right to operate the state telephone systems, with eventual ownership. It will oblige the concessionaires to improve the systems according to a program established by the state administration, giving preference in the purchase of materials to the national industries.

The duration of these concessions is unlimited, with a minimum in each case of twenty-five years. Right of repurchase by the state is reserved. The cession of the systems may be either by payment of value or by the admission of the state as a stockholder in the company. The concessionaires will pay to the state an annual amount not less than 5 per cent of the gross receipts of their respective companies, as shown in the annual budget, and a share in progressive degree of the net returns on capital when these exceed 7 per cent.

# First Convention of Middle West Division

### Commercial Section Discusses Increase of Residential Business and Importance of Sales Department—Social Aspects of Electric Service—Selling Bonds to Customers

THAT residence customers can be educated to the use of from forty to fifty kilowatt-hours as an average monthly consumption was asserted by N. T. Wilcox in presenting his report as the chairman of the Commercial Section of the Middle West Geographic Division of the National Electric Light Association at the first annual convention of the division, which began on Wednesday, April 11, at St. Louis. Mr. Wilcox said that the average monthly residential consumption in most sections of the country now is under 20 kw.-hr., a figure at which the expense of establishing and maintaining the service is not returned to the utilities. The larger figure that ought to be reached, he said, is exclusive of the use of ranges, refrigerators or like household equipment. Mr. Wilcox characterized residential business as one of the most important fields for the development of energy sales.

#### Importance of Commercial Men

E. W. Lloyd of the Commonwealth Edison Company, Chicago, thought that the central-station commercial man in many organizations does not occupy the position to which the importance of his work entitles him because central-station executives often do not themselves appreciate that his position ranks with the most important in the organization. Executives must realize that the commercial department is in the same position in the central station as in any other business which must depend on the ability of its sales forces to market its products. He criticised the attitude of the commercial man who looks on his position merely as a stepping stone to something else, thus defeating the very objects for which he should be working.

R. F. Schuchardt, Commonwealth Edison Company, asserted that the time has gone by when central-station men can ignore the National Electric Light Association and the opportunities it gives for development of men and methods through the broad contacts it affords. He said that executives who refuse to allow their men to participate are sinners against their stockholders by depriving them of potential increased returns as well as against their employees.

#### Social Aspects of Electric Service

The social aspects of the distribution of electricity were presented by Paul Winthrop Brown, who said that electricity has so multiplied the power of men to accomplish tasks that, in spite of the increase of wealth and population in the United States, the servant classes have decreased, although in the past history of the world an increase in wealth has always brought an increase in their number.

Louis H. Egan, president Union Electric Light & Power Company, St. Louis, discussing customer ownership, called attention to the fact that the supply of preferred stock will not permit an indefinite continuance of the present methods of selling securities to customers and predicted that in time bonds and other securities would be sold in the same way.

The annual banquet was held Wednesday evening. President Smith, Vice-president Davidson and Executive Manager Aylesworth of the N. E. L. A. were the speakers.

Better business development, public relations and rural lines were discussed at the Thursday sessions.

## Pennsylvania Men Confer

**Relays and Automatic Stations Are Discussed at N. E. L. A. Meeting at Wilkes-Barre**

A MEETING of the Pennsylvania Electric Association, which forms part of the Eastern Geographic Division of the National Electric Light Association, was held in Wilkes-Barre, Pa., on April 6 at which several good papers were presented and discussed by the members. The meeting was preceded by a luncheon, A. J. Llewellyn, general manager of the Luzerne County Gas & Electric Company, acting as toastmaster. The eighty visiting members were addressed by R. R. Van Horn and Mayor Daniel L. Hart of Wilkes-Barre. Following the luncheon E. A. Lewis and Paul Sporn discussed relay protection on interconnected systems. Mr. Sporn pointed out that relays should be installed to satisfy any operating condition and should clear trouble and also maintain service. He said that differential protection had worked out satisfactorially in safeguarding equipment and that the use of overload and directional relays had become standardized on ring systems. On outgoing parallel transmission lines he recommended the mechanically balanced relay and for the incoming ends of such lines the electrically balanced relay.

Standardization of wood-pole line construction was taken up by R. R. Curtis, who said that the practices of the Luzerne County Gas & Electric Company were largely based on the National Safety Code. A standardized construction code book has been developed which works very well on the system, and standardization is gradually being obtained that will permit any service man or lineman to work intelligently on any part of the system. Fir cross-arms with six pins have been adopted, as have standard conductor sizes. No. 0 hard-drawn copper is used on all transmission lines, No. 0 insulated wire on primary mains and No. 4 on branches. In three-wire service the neutral is made one-third the size of the outer wires. Standardized makes and sizes of insulators are used on the different circuits in the system. In discussing the paper the opinion was expressed that great improvement had been made in the quality of insulators and construction materials, but in many cases difficulty had been found in obtaining insulators for guy wires on crossings with factors of safety equal to the specification set by the Public Service Commission. Further discussion brought out the fact that three-wire service had been used to good advantage on 2,300, 4,000, 6,600 and 11,000-volt circuits.

### Automatic Substations

An illustrated lecture on automatic substations was given by Chester Lichtenburg in which the author indicated the rapid strides made in the art as applied to motor-generator, rotary converter and transformer substations. The wide adoption of the reclosing circuit breaker for substation use was advocated and numerous slides were shown of actual automatic installations. A lively pro and con discussion of the paper was followed by a short talk on education by J. G. Osterhaut and a talk on accident prevention by Paul Kuhn.

Delegations were present from points as widely separated as Baltimore and Pittsburgh and widespread interest was shown in plans for future section activities. The next meeting of the association will be in Johnstown on May 8.

## Millikan on the Big and Little in the Universe

Gulliver in his travels never saw wonders to compare with those now known to exist in the universe. So declared Dr. R. A. Millikan, director of the Norman Brooks Laboratory of the California Institute of Technology, Pasadena, in an address made on Wednesday evening, April 11, to the New York Section of the A. I. E. E. He first discussed the big things of creation, dwelling on the indications from late researches that the universe has finite dimensions and picturing it to the audience by visualizing distances in terms of pin points, oranges and miles. The past decade, in the opinion of Dr. Millikan, has witnessed more progress in scientific knowledge and accomplishments than any other period of history and has made possible a comparatively exact knowledge of matter, energy and space.

Turning from the big things to the small things of creation, Dr. Millikan then discussed atomic structure and electrons. Radio activity, he said, is now considered a general property of matter and all matter is apparently made up of atoms containing a nucleus of positive and negative electrons which restrain other electrons having orbital movements about the nucleus. The quantum idea of sudden changes in energy, matter and space conditions has been pretty well established by late experiments, the lecturer thought, and in the consideration of how energy from the ether is obtained by the electrons the hypothesis that the quantum is part of the electron, and not the corpuscular hypothesis, is, he held, the correct one.

Dr. Millikan discussed recent experiments at high altitudes which gave indications that hard ray emanations exist in space and furnish the energy required to expel electrons, both positive and negative, from the atom. He also said that, although present experiments permitted only a breaking down of atoms with resulting changes in matter, no reason existed to doubt that atoms could be built up to produce equally startling changes in matter.

At the business meeting of the section Calvert Townley, the retiring chairman, announced the election of these officers for the ensuing year: Chairman, L. F. Morehouse; secretary, E. B. Meyer. F. M. Feiker and Prof. J. H. Morecroft were made members of the executive committee.

## Remands Potomac Case

**United States Supreme Court Disclaims Jurisdiction at This Stage of Proceedings**

THE dismissal by the United States Supreme Court of the appeal of the Public Utilities Commission of the District of Columbia from a decision of the District Court of Appeals which had directed the District Supreme Court to proceed further in the injunction proceedings instituted by the Potomac Electric Power Company in resisting a rate reduction means virtually that there must be a revaluation of the company's properties for the purposes of rate making by the District Supreme Court or, under its order, by the Public Utilities Commission.

Chief Justice Taft, speaking for the unanimous court, declared invalid that section of the act creating the District of Columbia Public Utilities Commission which sought to convey the right of appeal to the United States Supreme Court in cases in the condition of that at issue. The Chief Justice held that this section attempted to confer legislative authority upon the court. The unconstitutionality of the section did not, however, affect the validity of the remaining sections of the act. Appeal will be permissible in cases which have been completed in the lower courts.

### History of the Case

The original lawsuit, now referred to the lower courts, involves a question of principle in fixing the valuation of public utilities for rate-making purposes. When the commission began valuation of the properties of the Potomac company in 1915 it took reproduction values as of July 1, 1914. In deciding the case in 1917, the commission added the actual cost of replacements between July 1, 1914, and July 1, 1916. The commission fixed the value as $11,231,000 and ordered a reduction in rates of 20 per cent. The company asserted that reproduction values should have been as of Dec. 31, 1916, and sought an injunction declaring the new rates unlawful, unreasonable and inadequate. The company alleged a fair value of the property to be $15,642,000 and that other property worth $5,000,000 had been illegally excluded from the valuation by the commission. The District Supreme Court dismissed the bill, but the District Court of Appeals reversed this decision. The commission appealed to the United States Supreme Court.

While the litigation has been pending the old rates—which were 10 cents per kilowatt-hour for domestic consumers—have been in operation in the District of Columbia, the difference between these rates and those ordered by the commission being impounded until final disposition of the case. This impounded fund is now nearly $4,000,000 and is increasing by $100,000 a month.

Pronouncements of the Public Utilities Commission of the District made since the case went to the United States Supreme Court will be found under this week's "Commission Rulings."

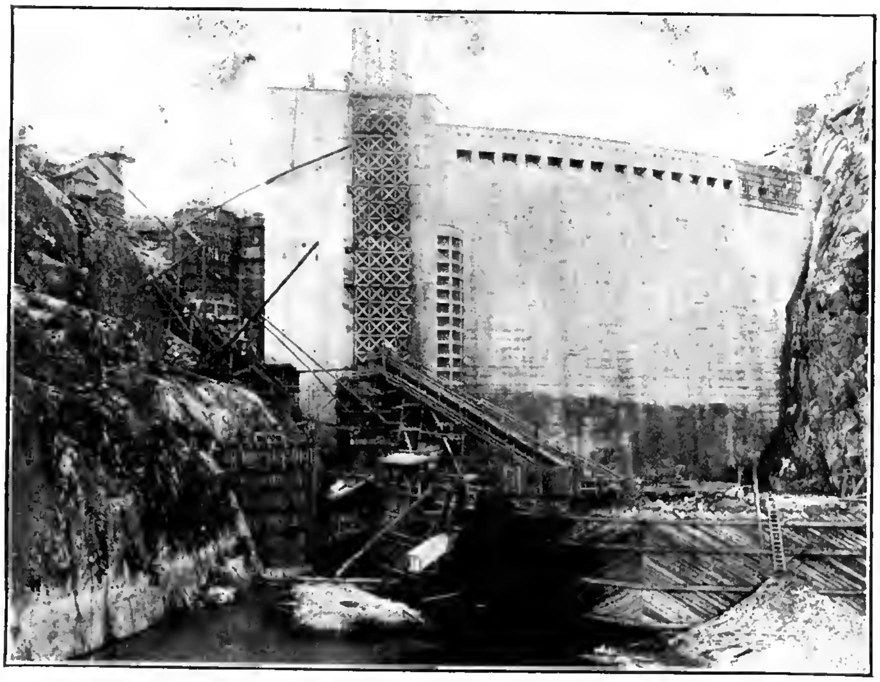
## Hetch Hetchy Nearly Ready

**San Francisco's Big Water and Power Plant Will Have an Initial Rating of 80,000 Kva.**

CONSTRUCTION work on the Hetch Hetchy domestic water supply and power project of the city of San Francisco is progressing rapidly, and city officials estimate that the Moccasin Creek power plant will be ready for operation before the middle of 1924. An 18-mile tunnel will convey the water for domestic supply and power from a diversion dam several miles below the main Hetch Hetchy dam to the forebay near the Moccasin Creek power house. Sixteen miles of this tunnel has been bored, and the work will be completed within four months. One-third of the 5,000-ft tunnel from the forebay to the penstocks has been driven; excavation for the four penstocks has been completed; excavation for the power house is under way; contract has been awarded for the structural-steel frame of the power house, and both electrical and hydraulic equipment has been under contract for some time. Delivery is to be made on all power-house equipment before Aug. 31 of this year, and the plant is expected to be in operation within eighteen months.

Four 20,000-kva., 257-r.p.m., three-phase, 11,000-volt generators will be installed under the present contract. These will be driven by 25,000-hp. double overhung impulse waterwheels operating under an effective head of 1,250 ft. Eight 36-in. hydraulically operated gate valves will control the flow of water at the point where the penstocks enter the power house. An overhead crane with a span of 50 ft. and a capacity of 135 tons will be included in the power-house equipment.

Surveying crews are now in the field locating the 135-mile double-circuit steel-tower transmission line from the Moccasin Creek power house to San Francisco. This line will be completed and ready for service before the power plant is finished. For the mountain and valley section of the transmission line a total of 525 miles of steel-core aluminum cable has been ordered. This will be 250,000-circ.mil copper equivalent, having a cross-sectional area of 389,000 circ.mil. Order has been placed for 177 miles of hemp-core copper wire with an area of 345,000 circ. mil for the San Francisco Bay division of the transmission line. Outdoor transformers and switching equipment will be used at the power house. The generator voltage of 11,000 will be stepped up by thirteen 6,667-kw. single-phase transformers to 115,000 volts delta or 154,000 volts star. Both oil and air-break switches will be used and all transmission and other equipment will be insulated for 154,000-volt operation.



UPSTREAM VIEW OF HETCH HETCHY DAM

This dam, which will store San Francisco's domestic water supply and develop 60,000 hp., is 226 ft. above the former stream bed and is now almost completed.

## Report of Engineers' Committee on High Dam

As reported in the ELECTRICAL WORLD for March 10, page 591, the Federal Power Commission has awarded a preliminary permit for developing power at High Dam, in the Mississippi between St. Paul and Minneapolis, to Henry Ford, subject to certain stringent conditions which he must accept before receiving a license. While awaiting final disposition of the matter a joint committee of the Engineers' Club of Minneapolis and the Engineers' Society of St. Paul has made a report in which it says that "the one logical agency for the development and proper utilization of the power developed at the High Dam is the Northern States Power Company." At another point in its report the joint committee says:

"If the coming of the Ford interests to the Twin Cities is contingent upon their having the initial use of the High Dam power, this is another method of immediate utilization of this power, and your committee would favor an award to the Ford Motor Company by the Federal Power Commission, provided that an arrangement for disposing of any excess power not required by the Ford Motor Company is made with a distributing agency. The committee further feels that the public's interests are entirely guarded whether the permit for the High Dam power is awarded to the Northern States Power Company or to the Ford interests because of the fact that the United States government through its Federal Power Commission has full and complete authority as to construction, operation and rates to be charged, no matter who develops and operates a water-power project under a federal grant."

In regard to the development and operation of the High Dam by the city of Minneapolis, the committee is unanimous in its opinion that "the hazard of an investment such as is contemplated is far too great and entirely unwarranted for so small an anticipated saving." The committee also expresses the opinion that "the development of the High Dam by the municipalities will have no effect whatsoever on the stabilization of public utility rates for lighting or power purposes, for the cost of producing electrical energy at the switchboard is only a small factor of the total cost of furnishing this energy to users."

## Eleven States Ratify Reciprocal Registration

For the purpose of making operative the reciprocal registration of professional engineers in the various states, several state boards of engineering examiners, which are members of the Council of State Boards of Engineering Examiners, have agreed to adopt and put in practice provisions to that end. So far, according to P. H. Daggett, secretary-treasurer of the council, eleven states have ratified reciprocal registration, namely, Arizona, Colorado, Florida, Indiana, Iowa, Louisiana, Michigan, Minnesota, North Carolina, Oregon and West Virginia. Wyoming and South Carolina are expected to take similar action this month.

The "Articles of Agreement on Reciprocal Registration of Engineers" contain the following provisions:

"Reciprocal registration shall be granted only to an applicant who is already licensed in a state which is a member of this council. A detailed professional record, properly attested, and accompanied by references as to character and qualifications from three registered practicing engineers, shall be filed with the board of registration of

the state in which the applicant is originally licensed.

"Professional experience shall be considered as beginning when the applicant shall have entered upon a position in professional engineering work which requires original thought and responsibility.

"As evidence of qualification for reciprocal registration, the applicant shall have had ten years of experience in professional engineering and in addition shall show that he is qualified to design as well as to direct engineering operations, and his experience record shall show progressive advancement in the character of the work performed.

"Graduation from an engineering school of recognized standing shall be accepted as equivalent to four years of practice.

"Reciprocal registration between states shall be made operative by means of certification of the applicant's qualification from one state to another. This certification shall be by means of a card or form bearing the date, serial number, signature of the officers and seal of the board of the state issuing same. These cards shall be printed and distributed by the Council of State Boards of Engineering Examiners."

# Colorado River Projects and Others

**Despite Delay of Treaty, Power Commission May Act on Diamond Creek and Glen Canyon—Cumberland River Rights Sought—White River Development**

WHETHER or not the Federal Power Commission will be content to allow the failure to ratify the Colorado River compact to delay indefinitely all development on the Colorado River probably will be determined at a meeting of the commission to be held April 18. The commission has advised the Governor of Colorado, according to a previous promise, that consideration is to be given the application of James B. Girand for a license to develop the project at Diamond Creek on the Colorado. It was stated in the letter to the Colorado Governor that any license issued to Mr. Girand would carry with it a condition that the use of the water for power purposes would have to be subordinated to its use for irrigation.

This carries with it the intimation that the commission may act on the Girand application at its forthcoming meeting. It is understood that Mr. Girand will accept the condition mentioned. The controversy over the project at Diamond Creek has been long drawn out. Mr. Girand received a permit covering this project in 1915 and has been trying ever since to obtain the necessary rights to begin construction.

It is fully expected, however, that the discussion will include the whole Colorado River question. Any discussion of the Diamond Creek project carries with it the necessity of considering the Glen Canyon application of the Southern California Edison Company. It also is believed that the Flaming Gorge project of the Utah Power & Light Company will be brought up, since that company is very anxious to utilize the coming field season to do the necessary drilling to establish foundation conditions. The Kremmling project of the Denver Gas & Electric Light Company is also to be considered.

### SODA POINT DAM

Permission has been given the Utah Power & Light Company to alter again the exact site of its Soda Point dam. Permission was granted previously to change the site from the original location to a point 1,200 ft. up stream. Further foundation investigations revealed that better conditions exist at a point 700 ft. above that point.

The Michigan Hydro-Electric Power Company of Three Rivers, Mich., affiliated with the Midwest Power Company, has applied for a preliminary permit covering a project on the St. Joseph River near Three Rivers. It is planned to develop 2,500 hp. The company is prepared to begin its development immediately.

The Midwest company also is planning a development on the Grand River, northeastern Oklahoma. The company operates public utilities in several towns in that region. The new power is to be fed into those systems.

### FALLS OF THE OHIO AND WHITE RIVER PROJECTS

The Cumberland Hydro-Electric Power Company, recently organized in Indianapolis, which holds options on valuable Cumberland River rights in southeastern Kentucky, has applied to the commission for preliminary permits covering three projects on that stream. The Cumberland company has entered into a contract with the Middle West Utilities Company of Chicago with the idea of carrying out the Kentucky development, which is an important adjunct to the utilization of the power to be developed by the new government dam at the Falls of the Ohio. The Middle West company has properties in Kentucky and in Indiana which are in a position to absorb the power thus to be made available.

Full development of the Cotter site on the White River, in Arkansas, is to be undertaken by a company being organized by Hugh L. Cooper. The interests of the Dixie Power Company in this project already have been taken over by Colonel Cooper. The project contemplates the erection of a dam 215 ft. high. An extensive pool will be created which will reach up the river as far as Forsyth, Mo. In addition, sites are to be developed on the North Fork and the Buffalo Fork of the White River. The total development will create 125,000 hp. The possibilities of this site long have been recognized. For ten years prior to the passage of the water-power act determined efforts were made to secure authorization from Congress for the development. It was one of those projects which were caught in the long period of uncertainty which preceded the final enactment of the water-power act.

## Water Power in Maine

**Conservation Program Is Defeated by the Governor's Attitude and the Disagreement of Legislators**

PLANS for the development of a storage reservoir for hydro-electric and other water-power conservation in the Dead River and Kennebec River valleys of Maine failed to materialize at the session of the Legislature which closed April 7 and which was marked by sharp divergences of opinion between Governor Baxter, the members of the two houses and the public utility and manufacturing interests interested in furthering the cause of conservation. During the session the controversy over this issue overshadowed practically all other matters at the Capitol. General agreement exists as to the necessity for storage-reservoir construction on the Dead River, and the well-known opposition of the Governor to private ownership of water-power facilities under public regulation appears to have been the chief factor in the failure of a constructive measure to become law.

Early in the session a bill was introduced authorizing the incorporation of the Kennebec River Reservoir Company for the construction of a dam on the Dead River on land owned by the state. It was provided that the amount to be paid for the land should be determined by arbitration. Governor Baxter vetoed the bill, and the veto was overridden by a two-thirds vote. The Governor then appealed to the people to defeat it by a referendum, the vote to be taken at the regular election in September, 1924. The public utility and manufacturing interests which were asking for the charter met this issue by circulating petitions demanding a special election so that the question might be settled this year. The Governor followed by a message to the Legislature stating that a compromise had been reached by which a new developing corporation (the Dead River Reservoir Company) would pay the state $1,000,000 rental for the right to use the land and resources involved, in forty annual payments of $25,000 each.

The compromise bill was never introduced, but so much confusion and cross-purpose action ensued that the Legislature finally repealed the original act, thus annihilating the hope of conservation in the Kennebec and Dead River valleys at this time. As the Maine constitution would have to be amended to enable state development of water powers to be attempted, there appears no present danger of progress toward public ownership; but in the meantime power users will be obliged to suffer a continuance of handicaps through

water shortages in competition with other conservation developments in Maine and elsewhere, and a deplorable waste of power will go on as a result of the fiasco with which the session closed.

## Indianapolis Companies Show Rapid Growth

An increase of between 28 and 30 per cent in the production and sale of electrical energy used for lighting and power purposes in 1922 over the preceding year is indicated in the annual statements for the year ended Dec. 31 made by the two light and power utilities of Indianapolis and filed with the Indiana Public Service Commission. The financial statements of the Indianapolis Light & Heat Company and the Merchants' Heat & Light Company both reveal a comfortable margin of gross income as a result of the year's business, due in the main to the increase in electric power used by the industrial companies of the city. The rate of increase in energy generated and sold for the first two months of this year is even greater than that for the corresponding period of 1922, being estimated at 40 to 50 per cent.

According to the financial statement of the Indianapolis Light & Heat Company, total operating revenues from all sources for the year 1922 were $3,910,120 and operating expenses were $3,051,364. The gross income came to $887,251. After deducting interest charges on the funded debt and taxes, there was total net income for the year of $678,138. The total amount of electrical energy generated during the year, the report shows, was 138,356,280 kw.-hr.

The total kilowatt-hour production of energy by the Merchants' Heat & Light Company for 1922 was 80,094,318. Total earnings of the company from the sale of energy were $2,064,833 and operating expenses were $1,425,810. There was a gross income from lighting and power of $660,811. Total commercial lighting revenues were $642,356, representing the sale of 11,977,988 kw.-hr.; municipal contract lighting revenues were $305,482, and commercial power earnings were $892,982. Revenues from sale of energy to other utilities totaled $224,014. Total merchandise sales were $41,283, showing net profits of $7,599.

## Iowa May Tax Water-Power Plants 10 Cents per Hp.

A committee of the Iowa lower house has had under consideration a bill which provides for the issuance of permits for the construction and operation of dams and the imposition of a $100 original permit fee and an annual privilege tax of 10 cents per theoretical horsepower. The permit fee would be required for dams now constructed as well as those to be constructed in the future, and the occupational tax would be levied on all dams and water-power plants built after the enactment of the law. Permits would be required for all except municipal dams. Sections to prohibit unlawful combinations and price fixing of the output of any dam under heavy penalties are contained in the bill, which has been drawn up along lines recommended by Governor Kendall in a message to the Legislature.

## Brief News Notes

**A. S. M. E. Seeks Postponement of Law for Registration of Engineers.**—The American Society of Mechanical Engineers is attempting to obtain a postponement of the law in New York State requiring the registration of all engineers in the state by May 5, 1923, and the New York membership of the society is being circularized to learn the opinion of mechanical engineers on the various phases of the law.

**Wireless-Telephone Record.**—What is said to be a new distance record for wireless telephony over a high-voltage transmission line was established when the Lake Superior District Power Company talked 42 miles from its branch at Ashland, Wis., to its Ironwood (Mich.) branch. The company expects to use the system extensively for communication between its plants in the northern parts of the two states.

**Marshfield Sticks to Municipal Plant.**—Following the example of Manitowoc, Wis., the city of Marshfield, in the same state, has resolved to increase the equipment of its municipal plant and has discontinued negotiations looking to the connection of the city with the high-power lines of either the Wisconsin Valley Electric Company of Wausau or the Wisconsin-Minnesota Light & Power Company of Eau Claire. New equipment will be purchased from the Allis-Chalmers and Westinghouse companies.

**Daylight Saving as a Crime.**—Amid news of the usual legislative struggles in early spring between advocates and opponents of daylight saving stands out the passage of a bill by the lower house of the Connecticut Legislature imposing a fine of $100 or a sentence of ten days in jail for the "willful public display of any time-measuring instrument or device intentionally set so as to indicate any time other than standard time." Fortunately the Draconian spirit in which a predominantly bucolic House approached the problem was emulated in the Senate, which has left daylight saving as it found it.

**Utica Company to Extend Use of Carrier Current.**—The Utica Gas & Electric Company plans to extend the carrier-current wireless-telephone system it has now in use between its Trenton Falls plant and Utica so as to include the Rome and Watertown plants. The installation by the General Electric Company has been particularly successful, the company reports, and since Dec. 7, when the system was first put in use, only one suspension of communication has been forced. The Utica company was a pioneer in the use of carrier current for interplant communication.

**First Electrically Driven Passenger Boat for Great Lakes.**—The Goodrich Transit Company announces that plans have been completed for the construction by the Manitowoc (Wis.) Shipbuilding Company of the first electrically driven passenger boat on the Great Lakes. It will go into service next season between west short ports of Lake Michigan. The vessel will be from 345 ft. to 360 ft. long, will contain 300 rooms above decks with 600 berths, and the cost is estimated in the neighborhood of $1,000,000. No decision as yet has been made as to the exact type of equipment to be installed.

**Forty-two Thousand Persons Go Through Tunnel.**—Upward of forty-two thousand persons went through the power tunnel of the Niagara Falls Power Company during the week that it was open for public inspection prior to admitting the water. The average was 500 persons each hour that the tunnel was open. Many engineers and scientific men came from a distance to examine the project. Among the visitors were the entire senior class of the University of Kentucky's school of engineering. The new tunnel is one mile in length and 32 ft. by 32 ft. in diameter.

**Johns Hopkins Engineering Lectures.**—The first of the open lectures on engineering practice given each year at Johns Hopkins University, Baltimore, was delivered on Wednesday of this week on a civil engineering topic. Two others will follow—the first on Wednesday, April 18, when N. W. Storer, general engineer with the Westinghouse Electric & Manufacturing Company, will consider the "Possibilities for Steam Railroad Electrification," and the second on Monday, April 30, when George A. Orrok, consulting engineer, New York City, will discuss "Power Development, Past and Future."

**Wisconsin Utilities to Spend $25,000,000 This Year.**—Basing his estimate on the returns of a questionnaire sent out by the Wisconsin Public Utilities Bureau, J. P. Pulliam, the retiring president of the Wisconsin Utilities Association, said in his address at the recent meeting of that body that the utilities of Wisconsin would spend between $25,000,000 and $30,000,000 during 1923 for additions, extensions and improvements to their plants and outside equipment. Among the larger expenditures he listed were $6,860,000 by the Milwaukee Electric Railway & Light Company and the Wisconsin Gas & Electric Company, $1,500,000 by the Wisconsin Public Service Corporation, $925,000 by the Wisconsin Power, Light & Heat Company and $700,000 by the Lake Superior District Power Company.

**Hydro-Electric Project to Serve Petrograd.**—An 80,000-hp. hydro-electric plant, situated east of Petrograd on the Volchov or Wolko River, is under construction, according to Max

Kadinsky, a Russian engineer who is a graduate of the University of Illinois. Eight vertical turbines with a capacity of 10,000 hp. each under a head of 40 ft. will make up the installation. The average yearly output, estimated at 40,000 hp., will be transmitted to Petrograd, a distance of about 80 miles, at 110,000 volts. The power house will be a reinforced-concrete building and the dam of masonry type. Work already done includes about one-third of the excavation for a canal connected with the project, a part of the caissons which must be sunk for the power house and an ice-diversion wall.

**Growth of Load Will Force Rapid Expansion of Cahokia Plant.**—A probability that when the Union Electric Light & Power Company of St. Louis completes the first unit of its new Cahokia power plant on the east bank of the Mississippi River next autumn it will within a few weeks begin construction of the second of the four ultimate units was forecast by Louis H. Egan, president of the company, in a recent address. It had been thought that the second unit would not be undertaken before two years, but the rapid increase in consumption in the St. Louis district will force the company to accelerate its plans, and the entire construction, which it was intended to spread over ten years, may be accomplished in five or six.

**May Generate Electricity from Sewage-Disposal Plant.**—A possibility that Milwaukee will generate the energy for its street-lighting system in the sewage-disposal plant under construction for the city on Jones Island, instead of obtaining the power from the Milwaukee Electric Railway & Light Company, as it does now, exists, if the report of T. C. Hatton, chief engineer of the sewage-disposal commission, may be taken at its face value. The sewage-disposal plant is to be finished next year, and Mr. Hatton says: "The maximum capacity of the boiler plant is 6,200 hp., but when two boilers are operating at a 20 per cent rating they can produce all the power required up to 1930 for the street-lighting needs of this city unless the city decides to install generators for producing current for street-lighting purposes." This is interpreted to mean that only two boilers will be needed to dispose of the sewage and that the other two which are to be installed will await only the installation of generators by the city to furnish energy for the street-lighting system.

**Oversea Telephony.**—As an outcome of the recent successful demonstration of wireless telephony between New York and London, the British Postmaster General has appointed a committee "to consider in the light of recent progress in the wireless science the possibilities from a technical standpoint of transatlantic wireless telephony of sufficient reliability for commercial use and to advise what practical steps, if any, can at present be taken to develop this means of communication." A beginning of commercial service is, however, according to American authorities, at least twelve months and probably twice that time away. Ignorance of the precise nature of atmospheric changes, which make talking easier by day than by night and harder in summer than in winter, is a hampering factor. The prospect is that much more powerful broadcasting apparatus will have to be used in the summer than that which so far has been used in successful experimental demonstrations. Another great difficulty, and one which makes official activity by Great Britain particularly desirable, is that the present English telephone circuits are not adaptable to relaying wireless messages to or from the coast, so that improvement of the present apparatus in use on land lines in England is essential to commercial communication.

# Associations and Societies

**Nebraska Section, N. E. L. A.**—The annual convention of this section, which forms part of the Middle West Geographic Division of the association, will be held on Thursday and Friday, May 10 and 11, at Omaha.

**Engineering Council of Utah to Give Banquet.**—The annual banquet of the Engineering Council of Utah has been set tentatively for April 23 at the Hotel Utah, Salt Lake City. Calvin W. Rice and other prominent engineers are expected to speak.

**Associated Manufacturers of Electrical Supplies.**—The summer section meetings of the Associated Manufacturers of Electrical Supplies will be held at the Hotel Griswold, Eastern Point, New London, Conn., beginning Tuesday, June 26, and extending through the week. On June 28 the annual meeting of the association will be held.

**American Welding Society.**—The annual meeting of this society will be held at the Engineering Societies Building, New York, from April 24 to April 27. The committees on training of operators, resistance welding, electric arc welding and welding of storage tanks will report on the first day. New developments in the welding field will be discussed on the second day, W. L. Warner reporting on electric welding.

**Coming Section Meetings of A. I. E. E.**—Section meetings of the Institute to be held next week are announced as follows: Baltimore, April 20, "Insulator Design and Manufacture," K. A. Hawley; Boston, April 16, "The Panama Canal," Brig.-Gen. Chester Harding, U. S. A.; Cleveland, April 19, "Manufacture of Copper Wire and Cable," C. F. Hood; Seattle, April 18, "The Columbia Basin Project," W. T. Batcheller.

**Tri-State Water and Light Association.**—Birmingham technical men are getting ready for the annual convention of the Tri-State Water and Light Association, which will be held in that city on April 17, 18 and 19. On the first day Glen H. Corlette of the engineering department of Fairbanks, Morse & Company, Atlanta, will speak on "The Oil Engine as a Prime Mover and Its Application to the Electric Plant"; A. A. Passolt, manager of the water and light plant at Newnan, Ga., will talk on "How Experience Guides Us in Looking Ahead," and there will also be short talks on Birmingham industries and the Alabama Power Company. Speakers selected for the second day include C. N. Grantham, city manager, Goldsboro, N. C., who will talk on "Service-Satisfying the Consumer," and E. T. Austin, General Electric Company, Atlanta, whose subject will be "Development of Street Lighting." Another speaker will be L. V. Gaffney, superintendent of the municipal plant of Gaffney, S. C., whose topic will be "Management in Easing the Day Load."

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

American Society of Mechanical Engineers—Pacific Coast meeting, Los Angeles, April 16-18; general convention, Montreal, May 28-31. C. W. Rice, 29 West 39th St., New York.

Tri-State Water and Light Association—Birmingham, April 17-20. W. F. Steiglitz, Columbia, S. C.

American Physical Society—Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

American Institute of Electrical Engineers—Spring convention, Pittsburgh, April 24-26; annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Sept. 25-28. F. L. Hutchinson, 33 West 39th St., New York.

American Welding Society — New York, April 24-27.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

Nebraska Section, N. E. L. A.—Omaha, May 10-11. Horace M. Davis, secretary-treasurer.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

Empire State Gas and Electric Association, Electric Section—Utica, N. Y., May 17-18. C. H. B. Chapin, Grand Central Terminal, New York.

Electrical Supply Jobbers' Association—Executive committee and general meeting, Hot Springs, Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

Missouri Association of Public Utilities—River boat from St. Louis to Peoria, May 24-26.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

California State Association of Electrical Contractors and Dealers—Dorner Lake, Cal., June 9-16.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

North Central Division, N. E. L. A.—Minneapolis, June 13-15. H. E. Young, Minneapolis General Electric Company.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

Society for the Promotion of Engineering Education—Ithaca, N. Y., June 20-22. Dean F. L. Bishop, University of Pittsburgh.

Canadian Electrical Association — Montreal, June 20-23. Louis Kon, 65 McGill College Ave., Montreal.

American Society for Testing Materials—Atlantic City, June 25-29.

National Council Lighting Fixture Manufacturers—Hot Springs, Va., June 26-28.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13. D. L. Gaskill, Greenville.

## Recent Court Decisions

**Company Cannot Be Sued Under Employers' Liability Act for Death of a Non-Employee.**—In Saylor vs. Enterprise Electric Company, the Supreme Court of Oregon has sustained the lower court in holding that an electric service company cannot be sued under the employers' liability act of the state because of the death of a man, not an employee, through contact with a high-tension line of the company brought about when he moved a hay derrick from one field to another. Only employees can prosecute under this act, and decedent's widow, if entitled to redress, must seek it otherwise and defendant will be entitled to plead contributory negligence as a defense. (212 Pac. 477.)*

**United States Supreme Court Upsets Minimum-Wage Law.**—By a divided court, five to three, the United States Supreme Court on April 9 declared the minimum-wage law passed by Congress for the District of Columbia unconstitutional as abridging the right of contract guaranteed by the Fifth Amendment to the Constitution. The decision was by Justice Sutherland, with whom concurred Justices McKenna, Van Devanter, McReynolds and Butler. Chief Justice Taft and Justice Sanford joined in one dissenting opinion, while Justice Holmes read a more sweeping dissenting opinion. Justice Brandeis, whose daughter is secretary of the District of Columbia Minimum Wage Board, did not participate in the case or in the opinion. The decision has national significance, establishing a precedent for tests of minimum-wage laws of thirteen states. The Attorneys-General of New York, California, Kansas, Oregon, Wisconsin and Washington intervened in the case, presenting briefs in support of the constitutionality of the act. The District of Columbia minimum wage law applied to women and to minors. The District Supreme Court declared the law valid. The Court of Appeals first upheld this decision, but on rehearing reversed it.

**What Is Ordinary Care in Case of Accident Arising Through Tree Climbing?**—In Godfrey vs. Kansas City Light & Power Company damages were awarded for serious injury to a boy who climbed a walnut tree on a vacant lot and came into contact with an electric power wire. Although the boy was a trespasser as to the owner of the land, he was not a trespasser as to the company, the Kansas City Court of Appeals declared in affirming the verdict, and the company was not relieved by his trespass of the duty to use ordinary care and anticipate reasonably likely occurrences. An instruction denying recovery if the boy knew or could have discovered by any means that there was a dangerous wire in the vicinity of the tree climbed was properly refused, the court held, since it wholly ignored the question of ordinary care; nor was an instruction directing a verdict for the plaintiff if the wire was uninsulated and could have been insulated and made harmless erroneous as imposing a greater burden than that of exercising reasonable care. These and similar instructions did not give the jury a "roving commission" to find the defendant guilty of negligence, nor was any question of law thereby submitted to it. (247 S. W. 451.)

## Commission Rulings

**District Commission Maintains Income Tax Ruling and Champions Historical Valuation.**—The Public Utilities Commission of the District of Columbia has ordered a reduction in the rates of the Potomac Electric Power Company. This reduction is in addition to the one ordered a year ago and designed to provide at least a 7 per cent return. As a matter of fact, the commission finds, the rate of return for 1922 was 8.9 per cent. The hearing was held on the initiative of the commission. The company asked that no change be made in its existing rates pending the final decision in the valuation case then before the United States Supreme Court. The Federation of Citizens' Associations of the District of Columbia urged the commission to state "clearly and definitely its treatment of the depreciation fund account and the federal income tax item of said company" and protested against "the practice of the commission of the allowance in full and their addition to the valuation base established in 1916, at book value, of all property additions made by the company since the commission's valuation of the year named." As to the federal income tax, the commission adhered to its position in previous cases that such taxes should be borne by the corporations and not passed on to the public—"should not be included as an operating expense, but should be paid from the net income of the company." The commission made an analysis of the depreciation account, saying that the reserve was growing rapidly to such a size that it would be necessary to give careful consideration at an early date to the manner in which it should be treated. The commission took exception to the statement of the federation that the property to the value of $7,000,000 added since its valuation order of 1916 had "never been appraised, valued or passed upon in review by the commission." "There is no better method of valuation known," it said, "than the ascertainment of the actual cost of property where such cost represents the investment honestly and prudently made. The commission believes this to be the most exact possible kind of valuation and in accordance with the provisions of the public utilities act. This position of the commission was clearly stated at the public hearing on the rates of the Potomac Electric Power Company held July 18, 1921, at which time the representative of the Federation of Citizens' Associations advanced the same argument on this question. To the commission it appears difficult to believe that the argument is intended to be taken seriously."

**Rates Should Be Large Enough to Insure Good Service.**—In fixing new rates for the Potomac Electric Power Company the District of Columbia commission said: "The rates now in effect in the District of Columbia are reasonable and compare favorably with those in effect in other large cities where power plants operated by steam are in use. What is desired by all is good service and this implies dependability as well as reasonable rates. To insure dependability, and for the business man particularly this is the first consideration, it is necessary that the company shall always be in a position to keep the capacity of its plant well in advance of the demand upon it. To insure economy in generating energy, it is necessary that the company shall keep well abreast of progress in the mechanical and electrical arts, installing new and improved appliances promptly when their worth has been demonstrated. To do these things the company must be able to raise funds in comparatively large amounts. To enable this money to be secured at reasonable rates, if at all, requires that the company shall have good credit. It is therefore in the interest of the entire public that rates be not reduced so low as to prevent that healthy growth of the company's facilities without which the entire community might suffer serious losses and inconvenience of various kinds. The commission does not therefore believe a return of 7.99 per cent more or less to be excessive, but it is nevertheless of the opinion that the circumstances of this case warrant a reduction in the present rates of the Potomac Electric Power Company and that this reduction will not impair the company's credit or its ability to serve the public."

**Construction Costs and Overhead Expense Under Pioneering Conditions.**—In its valuation of the property of the Idaho Power Company, the Idaho Public Utilities Commission held that the use of average prices over the period from 1913 to 1916 for the study of property placed in service prior to 1917 and the actual cost of property installed after that time was fair to both the utility and the public. An allowance of 10½ per cent was made for general overhead expenses, exclusive of interest during construction, in valuing this utility, which was constructed under pioneer conditions.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## W. B. McKinley and C. Studebaker Head New Company

William B. McKinley, who has been president of the Illinois Traction Company, will be chairman of the board of the Illinois Power & Light Corporation, which is acquiring an extensive group of long-established utility properties and which will control the Illinois Traction, Inc., through ownership of the entire capital stock of that company. The president of the Illinois Power & Light Corporation will be Clement Studebaker, Jr., who with his associates, through the medium of the North American Light & Power Company, is acquiring a controlling interest in the company. Mr. Studebaker is chairman of the board of the North American Light & Power Company. Among the directors of the Illinois Power & Light Corporation in addition to Mr. McKinley and Mr. Studebaker will be William A. Baehr, H. E. Chubbuck, George Mattis and G. W. Niedringhaus.

## Dr. Hollis to Leave Worcester "Tech"

Dr. Ira N. Hollis, for the past ten years president of the Worcester (Mass.) Polytechnic Institute, distinguished for his service in the navy and as an educator at Harvard University, has presented his resignation to the board of trustees, to take effect upon the appointment of a successor. Dr. Hollis was born at Mooresville, Ind., in 1856 and was graduated from the United States Naval Academy in 1878. For twenty years previous to his association with the Worcester Polytechnic Institute he had been professor of engineering at Harvard. He is widely known in educational and engineering circles and his philosophical views of the trend of science and economics command a wide audience. Upon retirement from the Worcester institution Dr. Hollis plans to engage in literary work.

**William Lamont Abbott**, the chief operating engineer of the Commonwealth Edison Company, Chicago, has been selected to head the special committee of the Federated American Engineering Societies which will make a study of coal storage. Mr. Abbott has long been a student of coal storage.

**Charles E. Wiggin**, manager of the electrical department of the Dunham, Carrigan & Hayden Company since 1910, has resigned to join the sales force of the Pacific States Electric Company. Mr. Wiggin is well known in electrical jobbing circles of the West.

P. O. CRAWFORD

## P. O. Crawford and W. M. Shepard Made Vice-presidents

At a recent meeting of the board of directors of the California-Oregon Power Company Perry O. Crawford, chief engineer of the company, was made vice-president and chief engineer and W. M. Shepard, general agent, was made vice-president and general agent.

Mr. Crawford received his technical training at Stanford University and took an A.B. in electrical engineering from that institution in 1908. During the next three years he was construction engineer for the Northern California Power Company and built several power plants. In 1912 he went to Afghanistan as assistant engineer on government hydro-electric work and for three years was in charge of the construction of the Jabl-us-siraj power plant. After returning to the United States he spent six months at Stanford University in research work under Prof. Harris J. Ryan. He became identified with the California-Oregon Power Company in 1916 and since that time has had charge of all engineering activities of that company, including the building of Copco dam and power house and several important transmission lines.

W. M. SHEPARD

Mr. Shepard was graduated from the Alabama Polytechnic Institute in 1904, and then spent about a year with the Knoxville & Northern Railroad. In 1905 he took the General Electric test course and in 1906 was transferred to the Atlanta office of the company and later to the San Francisco office. While with the General Electric Company in San Francisco he worked successively as supply salesman, apparatus salesman and special agent and was active in applying electricity to gold dredging and other typically Western industries. He joined the California-Oregon Power Company in 1916 as commercial agent and became general agent in 1918. He has had charge of all commercial activities of this company since his affiliation with it, including the negotiation of interconnection agreements with other power companies, and in addition has been in charge of valuation work and rate matters of the company.

**E. S. Roberts**, assistant commercial manager Blackstone Valley Gas & Electric Company, Pawtucket, R. I., has resigned to enter private business. Mr. Roberts has been active in the Commercial Section of the New England Division, N. E. L. A., and has done excellent work in the field of public relations.

**E. J. Seaborn**, formerly assistant treasurer of the Truckee River Power Company, has been transferred to Houston, Tex., as assistant treasurer of the Houston Electric Company and the Galveston-Houston Electric Railway. Mr. Seaborn has been with Stone & Webster for sixteen years and was with the Truckee River Power Company for five years. He is taking the place vacated by the transfer of H. L. Harding to Boston, where he will be in the treasurer's department of Stone & Webster.

**G. C. Neff**, Madison, Wis., was elected vice-president in charge of operation of the Wisconsin Power, Light & Heat Company, the Wisconsin River Power Company, the Southern Wisconsin Power Company, the Eastern Wisconsin Electric Company and the Mineral Point Public Service Company, all subsidiaries of the Middle West Utilities Company, at a recent meeting of the boards of directors of the above-named companies. These companies operate the large hydro-electric plants on the Wisconsin River at Kilbourn and Prairie du Sac. Mr. Neff is also treasurer of the Wisconsin Utilities Association and chairman of the rural-lines committee of the National Electric Light Association.

### R. E. Smith Electric Club's President

Richard E. Smith, advertising manager of the Southern California Edison Company, has recently been elected president of the Electric Club of Los Angeles. Mr. Smith has been engaged in the electrical industry in California for the past seventeen years. Starting as a wireman's helper in San Diego, he has held successively the positions of Pacific Coast representative of the National X-Ray Reflector Company, illuminating engineer of the Pacific Light & Power Company, sales manager of the Mount Whitney Power & Electric Company, district manager of the Tulare office, Southern California Edison Company, and, for the past two years, advertising manager of the Southern California Edison Company. He has been one of the oustanding figures in the club during the two years of its existence. His contributions to *Sparks*, the club's weekly bulletin, early earned for him a large and loyal following, and this, together with committee work and the directing of programs, has culminated in his election to the highest office in the club.

**William Dubilier**, president of the Dubilier Condenser & Radio Corporation, New York City, has just returned from Europe after spending a month visiting England, France, Germany and Belgium.

**C. B. Merrick**, who recently spent several months with the Valley Electric Supply Company of Fresno, Cal., is now back with the San Joaquin Light & Power Corporation as assistant to the new-business manager.

**Rudyard Goodland**, who has been assistant superintendent of the Oliver mine at Ironwood, Mich., for several years, has recently been made superintendent of distribution of the Wisconsin Gas & Electric Company.

**W. T. Leander** replaces W. H. P. Weston as secretary and treasurer of the Ironwood & Bessemer Railway & Light Company, and W. J. Hodgkins, formerly purchasing agent, is now general manager and has been succeeded in the position of purchasing agent by L. G. Gothe. J. B. O'Neil, formerly line superintendent, has become district manager, supplanting E. L. Hinchliff; E. O. Sinrud replaces W. A. Campbell as assistant district manager, and R. S. Wilhelm, formerly engineer of power station, has become chief engineer.

**Frank D. Schwartz** has resigned as Western salesman of the Indiana Rubber & Insulated Wire Company. Mr. Schwartz was formerly sales manager of the Electric Appliance Company, Chicago, and has long been a prominent figure in the rubber-covered-wire industry. For the last nine years he has had sales direction for the Indiana Rubber & Insulated Wire Company over the State of Ohio and all territories south and west. Mr. Schwartz has announced no definite plans for the future, but will remain in Chicago as his home is in Oak Park. F. R. Dolan has been appointed Chicago representative for the Indiana Rubber & Insulated Wire Company.

### O. H. Simonds Leaves Dubuque

O. H. Simonds, vice-president and general manager of the Dubuque (Iowa) Electric Company, has resigned to ally himself with the Electric Bond & Share Company of New York City. Mr. Simonds has been identified with the electrical industry since 1908, when, after being graduated from Cornell University, he joined the forces of the General Electric Company. For seven years thereafter he was employed in various capacities with that company, spending the last four in the lighting and railway department of its Chicago office. He then resigned to enter the engineering department of Elston, Clifford & Company, Chicago, and later became general manager of the Vicksburg (Miss.) Light & Traction Company. Since his advent in Dubuque as general manager more than five years ago, Mr. Simonds has been able to advance materially the interests of the properties intrusted to his management. The Electric Bond & Share Company of New York watched with interest the results of his efforts and has been desirous of obtaining his services for about two years. Recently the inducements were made so attractive that his satisfaction with his Dubuque position had in the exercise of sound business judgment to be subordinated. He will be stationed in New York.

O. H. SIMONDS

Mr. Simonds has been active in state association work and also in committee work of the N. E. L. A. and in addition has found time to devote to movements tending to civic improvement and advancement. His successor will be Thomas Parker, who comes from the Emporia (Kan.) division of the Kansas Power Company, owned and controlled by the Albert Emanuel Company.

**R. C. Hodges**, formerly chief electrical engineer with the Newburgh (N. Y.) Shipyards, Inc., has opened offices in Newburgh, specializing on power installation.

**C. L. Marshall** of the Tacoma office of the Puget Sound Power & Light Company has been transferred to the Wenatchee office of the Washington Coast Utilities. Z. E. Merrill, electrical superintendent at Wenatchee, who resigned, has been succeeded by Frank Walsh of Everson.

**William W. Merrill**, who has been associated with the Chicago Fuse Manufacturing Company since 1894, was recently elected president of the organization, succeeding Arthur D. Dana, retiring to become chairman of the board. Mr. Merrill has served successively as bookkeeper, cashier, secretary, assistant treasurer, treasurer, and since April, 1910, as vice-president and general manager.

**Thomas W. Peters**, who has been general superintendent of the Potomac Public Service Company, with headquarters in Frederick, Md., for nearly a year, has resigned. Mr. Peters resigns to join the American Water Works & Electric Company and will become the general superintendent of the Cumberland Edison Company, a property recently acquired by the American company. William C. Humm will succeed Mr. Peters at Frederick.

**E. A. Bradner**, newly elected president of the New Mexico Public Utilities Association, has been identified with public service corporations for more than thirty years. Starting as an arc-light trimmer, he has held all intermediate positions up to that of manager, which office he now occupies with the Las Vegas Light & Power Company and the Las Vegas Transit Company. For a number of years Mr. Bradner was chief engineer and superintendent of the Grays Harbor (Wash.) Railway & Light Company and later became manager of the central station at Hobart, Okla., holding this position until 1919.

**John W. Carpenter**, vice-president and general manager of the Texas Power & Light Company, with head offices in Dallas, was elected president of the Southwestern Geographical Division of the National Electric Light Association at the convention held recently at Oklahoma City. Mr. Carpenter has been identified with the electrical industry in the Southwest for the last twenty-five years. He entered the business in Corsicana and his rise has been steady and rapid. To Mr. Carpenter is given credit for having launched the recent campaign in Texas looking to the establishment of cotton mills, and it was due to his efforts that nationally known textile engineers visited Texas and made investigations which have already resulted in the organization of a half-dozen companies for building cotton mills. Mr. Carpenter has also been deeply interested in industrial education in Texas, and Governor Neff recently appointed him as one of the members of the first board of trustees of the new Texas Technological College to be founded in west Texas.

## A Quota Plan for Jobbers' Salesmen

**Report on Some Recent Experience in Setting a Sales Bogey in Each Community and by Commodities**

By H. F. Thomas
President Northwestern Electric Equipment Corporation, St. Paul

FOR a long time we have felt that we were considerably handicapped by the fact that our salesmen—like other jobbers' salesmen—have been working in the dark. That is, they have been going on from day to day and from town to town, taking orders for what commodities they could sell, but with no accurate or even approximate knowledge of the possibilities for business in any town or in any commodity. The average salesman works with no record of what he has done in past years in that town, or of what commodities he has sold there, except as he may remember certain large or otherwise conspicuous orders secured from individual customers. Therefore he has no practical guide as to what he should sell there, or how much he should sell, save his judgment at the time and his interest at the time in his various commodities and customers. He has no bogey that will tell how much he should sell, or where, or what.

### Rough Figures Set Up

We recently decided, therefore, to establish a quota system for our men the aim of which would be to set down the amount of business that they should be able to develop in each commodity they sell and ultimately to make that a quota for each community. We discussed this plan with our salesmen and they all asserted that it would be absolutely impracticable. All towns were different, they felt, and it would be impossible to forecast how much of any commodity could be sold. However, we went ahead and made an analysis of each man's sales for the last two years by commodities, and then we sat down with the salesman and studied these statements and tried to determine with him how much business we should be able to get in each town, dividing our totals according to the business which might be expected during the four quarters of the year. This of course was purely approximate and arbitrary and not scientific in any way for there is no reason for believing that the last two years' sales or any two years' sales can be taken as a basis for business possibilities. Yet we had to start somewhere.

### Two Forms Used

So we went ahead and on the sheets reproduced here drew up a quota for each salesman under convenient groups of commodities, setting down the total sales expected for each in each quarter of the year. We began on the first of the year to keep a record each month of the sales

SALESMANS QUOTA AND ACTUAL SALES.

SALESMAN John Doe MONTH OF February 1923.

| Group Com. | | QUOTA For 1st Quarter | QUOTA For February | MONTH Actual Sales | MONTH Over | MONTH Short | ACCUMULATED Over | ACCUMULATED Short | Necessary Sales in March to Meet Quota |

FORMS ON WHICH QUOTAS AND SALES OF JOBBERS' SALESMEN ARE RECORDED AND COMPARED BY COMMODITIES AND TOWNS

to each community classified in this way. On each sheet the name of the town, the salesman and his code number are filled in. Within the city of St. Paul a sheet is carried for each important customer, and casual customers are grouped so that our city salesmen may work to a quota also. On the back of the sheet we keep a record of the number of calls made on each customer, taken from the daily reports.

Then at the end of each month we draw up the sheet, also shown here, giving a report on the salesman's quota and actual sales. This form is printed and filled out in "ditto ink," so that copies may be made on blank paper, and each salesman receives one each month for each town. He knows, therefore, as he approaches a town just how he stands—over or under his quota—and how his sales there have compared with sales in other towns. He can look for the reason why.

### Effect on Salesmen

As a result of this we are now beginning to get actual figures on the sales of each salesman in each town by commodities, and a study of these figures is developing some interesting facts that are surprising to the salesman. For instance, in one town of 8,000 population one man during six months sold $350 worth of heating devices, but in another town of 24,000, only a short distance away, he sold only $200 worth. Before he saw the figure he was certain that he had got all the business that was possible out of the larger town, but when the actual sales were compared he could not reconcile the descrepancy. He knew that the bigger town should yield more business than the smaller.

In the beginning the men treated the whole thing as a joke—they laughed at it. But in the few months that the system has been in use they have discovered its worth to them and become enthusiastic. One of them recently said: "This is the first time that I have had a guide to what I am or am not doing and can see my weak spots." They are all watching the returns, studying and comparing them. They check up each case when some return of goods results in a smaller total sales than they expected. If they are disappointed in their sales in some town, they write and give us facts on the situation.

In short, the plan has given every man a new intensity of interest in his work and his responsibility for sales. We do not find fault when the total falls behind the quota. We do not use the quota to hound the men. The purpose is to give the men a means of checking up themselves—by towns and by commodities.

Next year, with a set of figures carrying twelve months' sales to every town and showing the totals on each commodity, we shall be in a position to make a real study and set a specific quota in advance for each town, for each salesman and for each commodity. We believe that this quota should not only recognize the total sales of 1921 and 1922 and the detailed reports on the sales of this year, but take into consideration also the population living in wired houses, the electrical conditions in the town—that is, the aggressiveness of the central-station company and dealers—the number of our customers, and also the strength of our salesman in the territory. From this we should be able to set a quota that will really reflect possibilities and not just our own selling history.

Already, however, the use of a practical quota on sales is proving of great value to our salesmen and therefore to the house, and we have no hesitation in recommending the plan to other jobbers and to manufacturers whose men must sell a varied line. Results are justifying the starting of the system on the most loosely approximate of figures, for even these are of real guiding value to the salesmen in their daily work.

# Need the Dealer Lose His Line?

## Facts from Hardware-Store Experience and Some Evidence from Electrical History—An Industry Problem that Needs Action

By A. W. Fischer
Director of Sales Magnetic Housecleaner Division, Birtman Electric Company, Chicago

Theoretically the dealer selects the kind of goods that he wants to sell out of his store, or the customers select the lines that the dealer carries by the expression of their preference in purchasing. In other words, the dealer sells what his customers want to buy. But as a matter of fact and experience it often happens that there is another thing that has a lot of influence in determining what a dealer sells. Other merchants take lines away from him by their superior skill in selling and sometimes force him practically to give up a profitable specialty or staple because the public is taught to buy these goods from some other kind of a store and they refuse to come to his store any more for them.

### Lost Lines of Hardware

Consider the hardware store, for example. The function of most hardware stores is merely to render a neighborhood service to the households of a community by providing a place where they may buy all kinds of metalware. When one wants nails or buckets or wire netting, or a stove or some tools to use in the home or garden, or a lawn mower or a poultry food hopper, the hardware store has them for sale. The carpenter also naturally goes there for his tools and nails and screws, and the plumber buys stuff there, and the farmer depends upon the hardware man for his spades and forks and in rural communities for plows and mowers and other agricultural machinery as well. And with this line of hardware are naturally grouped other associated materials, like window glass and weather strips and paint and brooms and cement and chickenfeed. All that and many other miscellaneous things make up the stock which we expect to find in a hardware store.

But wait a minute! Razors are hardware. They ought all to be sold out of the hardware store, yet they are not. We buy our safety razors from the drug store usually. Why? Because the man who sells soap decided one day that he could logically associate this article of specialty hardware with his staple and make some money at it, so he went after the safety-razor business and by better merchandising he has stolen the line away from the hardware man. Many men therefore go today to the druggist for their razors.

Cutlery is hardware also and used to be sold out of the hardware store. But today we buy much of it from the department store. And the department store has won away from the hardware dealer a great portion of the kitchen utensil business, just

as the department store has made itself headquarters for a lot of other popular merchandise that ten years ago used to be sold almost exclusively out of some other kind of a shop—and it is all right. Nothing can be said against the druggist for going out and rounding up the safety-razor business to sell with soap. We have no grievance, any of us, against the department-store man for selling our wives their baking dishes. The only criticism that can be expressed is against the hardware man himself for letting this easy-selling specialty of universal demand get away from him. For if he had been on his toes and made his store the chief source of information and supply on safety razors, we would all be purchasing our blades right there today.

### Lost Electrical Lines

All of this, of course, is set down by way of background for the electrical dealer, for he is apparently allowing himself to follow the lead of the hardware man and lose some of the best lines of merchandise that his store can sell. The electrical dealer failed to do a job with dry batteries. In the beginning he sold them, but as the demand grew he failed to keep pace with his supply, and service and selling and other stores took them up until today the hardware man has won a tremendous volume of this business on which the electrical man might have been making the profit.

Likewise the hardware man is selling an enormous number of incandescent lamps that the dealer could be handling if he had sensed the change when the people began to become "lamp conscious" a few years ago and select for themselves, and had increased his advertising, his display and his lamp service. Moreover, the electric flashlight has become a steady seller in the hardware store. The hardware man took it up just as soon as the housewife grew convinced that this device was dependable, and it became a staple not just sold into the homes but bought by the people without asking the advice of some expert.

The hardware man also saw the change in the popular attitude toward the electric flatiron so he put it in his stock. He will be just as ready to stock all the other electric heating appliances and the motor-driven appliances if the way is left wide open for him to walk into the business. And the drug store will be selling most of the heat pads, vibrators, immersion heaters and devices of that kind, if we let him.

The question is, will the electrical dealer be willing to let the hardware man and the department-store man appropriate this exceedingly important function of merchandising in the electrical industry? And will the electrical manufacturer and jobber stand by and see it happen without taking some part in this affair which concerns them so vitally? The entire electrical industry should and naturally does want to see the electrical dealer prosper and grow in strength and influence. It is worth a great deal to it to have, as a skirmish line for distribution, a class of local retail dealers who are electrical men and both sympathetic with the ideals and purposes of the industry and intelligent in interpreting them.

If the electrical dealer can be as good a merchant as the hardware man, all electrical manufacturers and jobbers would rather have him sell their goods. But if the electrical dealer does not build himself up and make his store as appealing and helpful to the householder as the hardware store, when it comes to the sale of electrical appliances, then the hardware man and the drug-store man and the department-store man will go right on invading his market as certain lines one after another become staples. If this goes on, then the electrical dealer will have left only the specialties that are harder to sell and naturally bring him less prosperity during the period of building up than later when they are established in the market and in popular demand.

There is plenty of opportunity for the electrical dealer—a big job and a fine chance to prosper. But it is not just his problem. It is the problem as well of the man who makes and the man who distributes these goods that his store should sell, and they individually must undertake the responsibility for keeping their lines in the electric store by guiding, stimulating and assisting the electrical dealer to hold his lines. And the only way that any dealer can hold his line is by doing a better job of selling than some other merchant in some other store. It is time that we men behind the electrical dealer made ourselves responsible for seeing that he does this very thing. These facts are proof that we have not done enough so far.

## Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

TRANSFORMER orders placed with American manufacturers since the first of the year have exceeded anticipations, and at present factory facilities are working very close to capacity. It is safe to say that in the last twelve years transformer sales in this country have been growing at the rate of 10 per cent compounded per annum, and there is much interest in manufacturing circles at this time to see whether this rate will be exceeded in the near future. All signs point to continued productive activity in this field for certainly the rest of this year.

### Immersed Self-Cooled Types Are Taking the Field

IN TELLING of the activities in the transformer field, Westinghouse has received so far this year orders for large power transformers aggregating 750,000 kva. The business closed in January alone would have been a good six months' business a few years ago. A striking fact in connection with this great activity in transformers is the relatively large amount which are of the oil-immersed self-cooled type.

### Shortage of Labor Affecting Transformer Production

BY LOOKING far ahead with respect to the supply of raw materials, leading transformer manufacturers have thus far been able to maintain full production. It is becoming increasingly difficult to obtain labor for the more skilled operations, and in some quarters toolmakers are particularly hard to obtain. Distribution transformers are still obtainable in reasonable quantities from factory stocks. Power transformers, however, are being quoted on long deliveries, sometimes running into eight or nine months and rarely falling below seven months on comprehensive orders. There has been little recent change in prices, but the rising costs of steel, insulation and labor, combined with the burdens of taxation and other overhead expenses, make it not improbable that some further adjustment may take place. In typical cases distribution transformers are selling at about one-third above pre-war figures, power transformers running below the distribution type in percentage advance. In

discussing the situation the point is effectively made that only a moderate advance was registered during the war in comparison with many other lines of electrical apparatus, and attention is drawn to the low ratio of transformer cost to the total cost of modern hydro-electric transmission development, frequently of the order of 1.5 to 3 per cent.

### Ameliorating Depression Evils When Business Is Booming

CONCLUSIONS by the committee appointed by Secretary of Commerce Hoover as chairman of the President's conference on unemployment have been made public after more than a year's study. Recommendations are under ten headings:

Collection of fundamental data.
Larger statistical service.
Research.
Control of credit expansion by banks.
Possible control of inflation by the Federal Reserve System.
Control by business men of the expansion of their own industries.
Control of private and public construction at the peak.
Public utilities.
Unemployment reserve funds.
Employment bureaus.

Most of the report is devoted to the importance of the collection of fundamental data. It says: "What is evidently needed is an increase in the resources of the Department of Commerce and a larger degree of co-operation with the department in co-ordinating and extending business information, so that business men and bankers may know promptly the facts about the rate of production measured in physical units, the stock on hand and in transit, the trend of prices, the volume of sales and the trend in money rates."

Of equal importance to the electrical industry is the sixth recommendation, which emphasizes the point that "Planning production in advance and with reference to the business cycle, laying out extensions of plant and equipment ahead of immediate requirements with the object of carrying them out in periods of depression and carrying through such construction plans during periods of low prices in conformity with the long-time trend, the accumulation of financial reserves in prosperity in order to mark down inventories at the peak, and the maintenance of a long view of business problems rather than a short view, will enable firms to make headway toward stabilization."

### Highly Competitive Tape Market Has Many Turnovers

VIGOROUS activity accompanied by acute competition for business is the feature of the friction-tape market, which is responding to the stimulus of increased wiring construction throughout the country. The use of black tape has become practically universal, probably not more than 1 per cent of sales being white specifications. Many hundreds of thousands of pounds of friction tape are being produced monthly in the United States, and jobbers are making a fairly rapid turnover of this product as it reaches their shelves. Foreign demand is reported to be improving in quarters where this class of trade is assiduously cultivated. Raw materials are in good supply, but their costs have stiffened sharply within the past year. Cotton at double last year's price now costs the tape manufacturer in the vicinity of 30 cents per pound (sheeting quotes 15 cents per yard and about one yard is required per pound of tape), and rubber sells around 35 cents per pound against 18 to 20 cents a year ago. Labor is not so difficult to secure, at least in representative plants where working conditions are thoroughly satisfactory, but the wage level is maintained at a high index figure. Automatic machinery is being utilized more and more in tape manufacture.

### Inexperienced Producers and Rising Costs Causing Unsteady Prices

SOME unsteadiness of prices in the tape market exists. This condition is due in part to the entrance of relatively inexperienced producers into the field, coupled with the rising cost of materials. In few lines of electrical manufacture has there been less appreciation of the meaning of quality products than in tape. In the past too much buying has been conducted on the theory that "tape is tape," and the difference between initial appearance and lasting quality has been overlooked by many purchasers. Hasty purchases based on the lowest obtainable quotation have been made without suitable study of the material offered and its record of durability in service.

### Steady Demand for Washers and Cleaners

WASHERS and cleaners appear to be doing a staple business, although the usual spring acceleration of demand is due. Competition is so widespread in this field and factories are so scattered that little complaint is being heard as to inability to supply local trade. Where particular makes are insisted upon at points far from the jobber's stock or producing plant, delay in filling orders is, of course, necessary in some cases; but, by and large, requirements have been well anticipated. New developments continue to interest the trade in the line of improved designs of apparatus, and the bearing of servicing is being considered more and more by dealers as a factor in securing satisfied customers. Reports have been received of some house-to-house motor-truck sales at cut prices, but these appear to be devoid of service features which are demanded and appreciated by intelligent buyers. On the whole, trade is in a healthy condition unless one deprecates the widespread manufacturing competition which characterizes current business in these outfits.

### Iron Manufacturers Keeping Well in Line on Raw Material Side

A STEADY and sustained demand for electric flatirons characterizes the current market, with little spectacular news. The manufacturers are very busy and by careful attention to buying for a well-studied demand are keeping well in line on the raw-material side. Prices remain firm; deliveries are on the whole in good shape, and the growth of new and old house wiring in many localities is stimulating sales. Normal replacement business and some duplication orders for reserve in the household equipment are adding to the total.

### Storage Battery Buying Quickened During Last Few Weeks

SUSTAINED interest in radio and increasing requests for proposals in connection with industrial and road truck service have quickened the buying of storage batteries during the past few weeks. Local stocks are being maintained only with difficulty, but manufacturing facilities were so increased during the past year or two that the situation has not given much trouble. Prices stiffened slightly on some types early this month. The expansion of central-station plants is resulting in some control-battery sales, and there is an active trade in starting and lighting batteries for motor-vehicle use as the season "goes into high" in automobile purchasing.

### Depending on the Government's Foreign Trade Pointers

INCREASING use of help and advice by the government's bureaus is seen in the recent report by the directors of the Bureau of Foreign and Domestic Commerce which stated that 135,000 personal calls were made in the interest of manufacturers during the year 1922. This is nearly double the number in any previous year. The Department of Commerce is encouraging co-operation with about seventy trade associations in the promotion of foreign trade through committees representing in all a membership of 150,000. The prospective users of the foreign bureau's service may have their names and interest in export trade recorded in the department's "Exporters' Index." At present this comprises fifteen thousand American merchants and manufacturers entitled to information on foreign trade opportunities and receiving confidential news bulletins.

### Study of Trade Necessary in Australia's Electrical Market

ASKED how the American manufacturer can increase his trade with Australia in electrical supplies and equipment, W. G. Watson, chairman and managing director of W. G. Watson & Company, Ltd., electrical engineers of Sydney, who is in San Francisco on business, stated to a correspondent of the ELECTRICAL WORLD:

"If you reduce your prices, you can

sell more goods. The present upward trend of prices of electrical goods in America is going to make it still more difficult to sell goods in Australia. If American manufacturers, exporters and shippers studied more fully the Australian requirements, it would be of considerable assistance to them.

"Appliance sales in Australia move about in the same proportion to population as in the United States. The electric ranges manufactured in the United States are too costly to allow for any large sales due to the high cost of getting the goods into the Australian markets. There exists an acute shortage of power, and plants almost everywhere are being increased in capacity. The completion of the Morwell scheme in Victoria will supply current at a pressure of 150,000 volts to Melbourne and other large cities. Steel core aluminum conductors and suspension insulators are being used."

### Germans Report Their Large Equipment Market Suffering

THE report of the Prussian Chambers of Commerce on German trade and industry during February states that in the electrical industry the inland purchasing power is weak. Neither official nor private customers dare place orders for large plant and machinery. Further, the partial fall of prices is causing some customers to hold back in the hope of further reductions. Foreign countries, for the most part, are showing reserve, in so far as the German prices, which have partly reached the world's market level and partly already exceeded it, admit of any competition. Accordingly a general falling off in orders is noticeable in high-pressure current articles, machinery, apparatus, installation materials and cables. The outlook for railway safety appliances is poor, and the sale of electric lamps in Germany and abroad shows no improvement.

### Germany's Electrical Exports via New York Double England's

SPECIAL preliminary figures showing imports of electrical goods through the port of New York during March showed that Germany sent \$32,905 and England \$17,123 worth. France sent \$14,643 and all other countries \$6,659. The highest value of an imported commodity from Germany was for sockets to the amount of \$7,731. No sockets were imported from England. Electric iron imports from Germany were valued at \$512. Other figures are as follows:

| | Germany | England |
|---|---|---|
| Batteries | \$512 | ... |
| Lighting fixtures | 4,170 | \$675 |
| Heaters | 804 | 108 |
| Plugs | 122 | 146 |
| Sockets | 7,731 | ... |
| Flashlights | 1,666 | ... |
| Vacuum cleaners | 30 | ... |
| Wireless apparatus | 963 | 370 |
| Bells | 2,533 | ... |
| Hair driers | 3,981 | ... |
| Carbons | 6,917 | 5,824 |
| Telegraph and cable apparatus | ... | 10,000 |

## The Metal Market

Most producers continue to quote copper at 17.37½ cents delivered, but report only occasional orders for small tonnages at that level. Copper is obtainable at 17.25 cents in two or three directions, but at that price also the volume of business has been small. Some forward copper has been sold at a considerable discount from this price, and consumers near New York where the freight rate is low have also been able to do better than 17.25 cents delivered. There is as yet no evidence of a buying movement, but it is thought that this cannot be postponed much longer, and few breaks in the ranks of producers holding for 17.37½ cents are expected. The export demand has also been weak.

The railway and electric subsidiary companies of the Public Service Corporation of New Jersey have placed orders for 4,000,000 lb. of copper to meet their operating necessities for the current year. All but a small part will be in the form of wire and cables. It is estimated that the electric company will consume about three-fourths of the total order to supply requirements for extensions.

NEW YORK METAL MARKET PRICES

| Copper | April 4, 1923 Cents per Pouod | April 11, 1923 Cents per Pound |
|---|---|---|
| Electrolytic | 17.37½ | 17.37½ |
| Lead, Am. S. & R. price | 8.25 | 8.25 |
| Antimony | 8.75 | 8.75 |
| Nickel, ingot | 30.00 | 30.00 |
| Zinc, spot | 7.65 | 7.55 |
| Tin, Straits | 48.00 | 48.00 |
| Aluminum, 98 to 99 per cent | 26.00 | 24.00 |

# The Week in Trade

**Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points**

INCREASED building construction and spring replacements are having a favorable effect on the industry in all parts of the United States. Motors and controlling devices are going to the industries in greater volume. Insulator manufacturers report unusually good business, some saying that the last month has been far above any month in three years. Shipments no longer hold stocks of commodities, but shortages are mostly due to lack of raw materials in the factories. Prices are stiffening in lamp cord, switches, tape, galvanized conduit and weatherproof wire.

**Boston** Business continues very active, with prices stiffening in lampcord, switch boxes, tape, galvanized conduit and weatherproof wire. Few shortages are reported by jobbers except in radio tubes. Road conditions still hamper the movement of heavy supplies by truck in the interior. Money is easy and no marked evidence of inflation was in sight Monday. Building operations gained 8 per cent over the first quarter of 1922 in the corresponding period this year, but a reaction in building is expected as a result of price changes in materials and labor shortage. Central-station expansion continues steady, and the construction of important interconnections is a factor in business.

**New York** Purchases in the retail trade are somewhat better, while buying from the jobbers is only fair. Manufacturers are buying raw materials in larger quantities and making many plant changes in view of increased production. Lamp sales during the week were in greater volume. Wire and wiring-device stocks are said to be lower owing to a heavy drain to new buildings. All supplies entering into central-station expansions are moving faster.

**Baltimore** Conditions are unusually bright, and prospects are for heavy business in every line with the opening of the spring season. There is a special drive on at the present time for the sale of cleaners and washers with a steady demand for this commodity. Storage batteries are very active with the supply normal. Radio equipment has fallen off to a certain extent owing to seasonal conditions. Wire is still very active.

**Atlanta** The general situation shows a continued gain in strength in practically every line, with a tendency toward price increases in the majority of electrical products. This is particularly true of all materials into which steel largely enters, and there are some expressions of opinion that slight increases will be noted in appliance lines before fall. One jobber reports that he has more unfilled orders on his books than at any time since 1920.

**Cleveland** Stability is reflected in the week's orders. Manufacturers have advanced prices slightly on copper products, but stocks are in good shape. New construction is keeping meters and fixtures in active demand.

**Chicago** Business continues very active, with jobbers and dealers reporting good demand for most commodities. Several advances were announced this week. Wire advanced approximately 5 per cent, porcelain 5 per cent and 10 per cent on certain types of insulators, wiring devices 10 per cent and transformers 5 per cent. Conduit prices remain the same, with an anticipated increase in prices of lock nuts and bushings.

# Demand, Supply and Price Trend of Nineteen Commodities as Sold in Sixteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Next Week Reports will include Conduit Boxes; Dry Batteries and Tape

| | Wire | Armored Cable | Conduit | Transformers | Poles | Pole Line Hardware | Porcelain | High-Tension Equipment | Fuses | Meters | Switches | Wiring Devices | Lamps | Commercial Fixtures | Motors | Radio | Washers and Cleaners | Irons | Storage Batteries |

**St. Louis** Sales of electrical supplies for the past month were approximately 20 per cent greater than for the same period in 1922. There is a splendid demand for radio sets, installation material for new buildings, automotive equipment and household appliances. The trend of prices is upward, especially on anything containing copper and steel. Some improvement is reported in the demand for pole hardware and all other materials used by public utilities.

**St. Paul-Minneapolis** Washers and cleaners are moving fairly well, but winter weather is holding this business as well as all others back. Prices seem more steady with a slight incline all along the line. The conduit situation is better. Radio is slowing up.

**San Francisco** Dealers' business is good with better sales on larger household appliances. Conduit boxes are in active demand with stocks low and prices firm. Tape stocks are normal. Recent packing changes have considerably stimulated quantity buying.

**Denver** Increasing prosperity in this region indicates a healthy demand for appliances of all types. Radio is holding up well, and as a consequence batteries and rectifiers when obtainable are moving also. Shortage in materials now appears to be due to manufacturers' inability to supply demand rather than to delayed transportation facilities. Uncertain prices are preventing placement of surplus stock orders. Collections have not shown the desired improvement.

**Portland-Seattle** Price levels remained about the same for the past week, but all building materials show a strong upward tendency due to very heavy demand. Wage scales have advanced in some of the building trades crafts. The increasing trend in prices of both material and labor is having a deterrent effect upon new building projects in some sections. Electrical jobbers report active industrial and central station demands, with a decrease in country business. Conduit stocks have materially improved in the past few weeks.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Pelton Water Wheel Awarded Large Pacific Coast Order

The Pelton Water Wheel Company, San Francisco, has been awarded a contract by the Portland Railway, Light & Power Company for furnishing a 72-in. butterfly valve for the lower end of the penstock and a 72-in. Johnson valve for the upper end of the penstock on its Oak Grove project. The turbine for this job which is now under construction at the Pelton shops is a vertical unit and will develop 35,000 hp. under a head of 850 ft. It will be the highest-head reaction turbine in the world.

## Approves Fixture Appeal

Assistant Secretary of the Treasury Moss approved last week the action of the Assistant Attorney-General at New York in appealing to the Court of Customs Appeals from the decision of the Board of General Appraisers in connection with the proper duty on electric light fixtures.

The appraisers' decision held that certain electric light fixtures classified as metal articles plated with gold or silver dutiable at 50 per cent ad valorem under paragraph 167 of the tariff act of 1913 were properly dutiable at the rate of 20 per cent ad valorem under the same paragraph of that act.

## Black & Decker Resume Payments on Common Stock

The Black & Decker Manufacturing Company, Towson, Md., manufacturer of portable electric tools, announces that the regular quarterly dividend has been declared on preferred stock, and that the payment of dividends on common stock has been resumed, these having been discontinued for about a year, following the recent depression.

## Wagner Electric 1922 Earnings Were $265,934

The annual report of the Wagner Electric Corporation for 1922 to its stockholders shows net operating earnings of $265,934 for the year 1922, after deducting physical depreciation and interest charges. After the payment of preferred-stock dividends of $52,500, earnings applicable to the common stock were $213,484, or at the rate of $2.73 per share on the outstanding common stock of the corporation.

All bank obligations were paid Aug. 11, 1922, and no bank borrowings were necessary to operations during the rest of 1922. The current liabilities shown reflect in general the normal obligations of the corporation incident to current business. Inventories of raw materials, work in process and finished products are priced at cost or the current market, whichever was lower. A very substantial improvement of the general business of the company was reflected in the last quarter of the year, and incoming sales for the first quarter of 1923 show a substantial increase over the same period in 1922.

## Combustion Engineering Handle Uehling Instruments in Canada

The Combustion Engineering Corporation, Ltd., and the Uehling Instrument Company have recently entered into an agreement whereby Uehling interests in the Dominion of Canada and Newfoundland will be handled exclusively by the Combustion Engineering Corporation, Ltd., with principal offices in Toronto, Montreal, Winnipeg and Vancouver.

## Inspiration Copper Sales Totaled $10,236,894

The Inspiration Consolidated Copper Company, in its annual report issued to stockholders last week, showed that its sales of copper in 1922 totaled $10,236,894, compared with $8,636,498 the preceding year. After expenses, depreciation and interest, there was an operating profit of $255,246, but an expenditure of $229,081 on account of suspension of operations left a net income of only $26,165, against a deficit in 1921 of $1,790,421.

Current assets at the end of the year, according to the Dec. 31 balance sheet, were $6,688,837, contrasted with current liabilities of $1,165,180. Of the current assets $2,518,745 consisted of cash and cash assets.

## De Forest Radio Sold

A controlling interest in the De Forest Radio Telephone & Telegraph Company, Franklin Street, Jersey City, N. J., has been secured by Edward T. Jewett, head of the Paige-Detroit Motor Car Company, Fort Street, Detroit, and associated local interests. Plans are under way for enlargements in the Jersey City works to double approximately the present capacity. Dr. Lee de Forest will act as consulting engineer for the new organization in the development of radio equipment.

## Ideal Electric Office Change

The Ideal Electric & Manufacturing Company, Mansfield, Ohio, has announced the consolidation of its Chicago office, formerly at 701 Fisher Building, with the Gebhardt Company & Associates, at 1419 Fisher Building, Chicago.

## Dwight P. Robinson Opens Philadelphia Office

The opening of a Philadelphia office is announced by Dwight P. Robinson & Company, engineers and constructors, New York City. The new office will be under the direction of Carl A. Baer, recently with the firm of Baer, Cook & Company, engineers, and a consulting engineer in the design of industrial, textile and power plants.

## Westinghouse Gets Philadelphia Order for 20,000 Meters

The Philadelphia Electric Company, which supplies the city of Philadelphia with electric light and power, has ordered from the Westinghouse Electric & Manufacturing Company 20,000 type OA watt-hour meters of various sizes. The value of the order was approximately $160,000.

The order, which is intended to satisfy the requirements of the Philadelphia company for several months, is one of the largest ever placed for such meters and is an indication of the very great increase in the demand for domestic lighting circuits. Although the size of the order is only in line with the general rapid improvement in the electrical industry throughout the country and is simply another evidence of the improvement in business conditions, specifically it is an indication of the large increase in home building activities in Philadelphia and other cities.

**The Ohio Brass Company, Mansfield, Ohio**, manufacturer of brass goods for electrical service, is planning for extensions at its local plant as well as at its branch works at Toronto, Ont. It is also purposed to make enlargements at the plant of the Ohio Insulator Company, Barberton, Ohio, a subsidiary organization, to increase the capacity approximately 50 per cent. Additional equipment will be installed at the latter works.

**The O. K. Battery Company, Dallas, Tex.**, has acquired property at 934-36 North Lancaster Avenue for a new plant for the manufacture of electric storage batteries and kindred electrical products. The structure is two-story and will be equipped for an output of about five hundred batteries daily.

**The Betts & Betts Corporation**, 645 West Forty-third Street, New York City, has made arrangements with Marshall & Company, Union League Building, Los Angeles, to handle its line of radio apparatus in the Pacific Coast territory.

**The Condensite Company of America**, Bloomfield, N. J., a division of the Bakelite Corporation, manufacturer of insulation products, will soon commence the construction of a new addition to its plant on Grove Street, to cost $32,000.

**The Bryant Electric Company**, Hancock Avenue, Bridgeport, Conn., will soon build a new addition 32 ft. x 56 ft., contract for which has been awarded.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in England (No. 5,960) for the best quality of copper rods for the manufacture of electric cables in quantity of about 60 tons per month.

An agency is desired in Denmark (No. 5,999) for machine tools, small tools, electrical material, etc.

The following inquiries have been received by the Philadelphia Commercial Museum, which will furnish names and addresses of the inquirers to any one desiring them and mentioning the number given: Parties in Bombay, India (No. 40,507), desire agencies for electrical goods, engineering supplies, etc. Addresses of concerns selling wireless telephone apparatus are desired by a party in Vera Cruz, Mexico (No. 40,568). A party in Stockholm, Sweden (No. 40,572), would like to communicate with manufacturers of forced-draft furnaces to be used with electric motor and blower.

THE AMERICAN MANUFACTURERS' FOREIGN CREDIT UNDERWRITERS, Inc., 110 William Street, New York City, have received an inquiry from a company at Tabasco, Mexico, which would like to get in touch with American manufacturers of batteries, flashlights and kindred electrical products.

INCREASING DEMAND FOR ELECTRICAL APPARATUS IN MEXICO.—Improvements to the electric service in the cities of Aguascalientes and Zacatecas, Mexico, and the extension of the electric lighting system to nearby towns, *Commerce Reports* states, has created an increasing demand for the cheaper electric household devices, such as electric flatirons, hot plates, toasters, etc.

LEONARD WORK, MANUFACTURERS' REPRESENTATIVE, 40 Rue Laffitte, Paris, France, desires to communicate with manufacturers of insulated wire and would like to receive prices and samples of the following; Annunciator wire, assorted colors; annunciator wire, twisted pairs, assorted colors; telephone twisted pair, inside wire; radio antenna wire, enameled wire for radio reactance coils, braided wire, rubber-covered sizes 16 to 12 (for lighting), braided rubber-covered fixture wire, and thin sheet copper such as is used for condensers in radio telephony.

PUBLIC UTILITIES OF VICTORIA, BRAZIL, LEASED TO AN AMERICAN-CONTROLLED COMPANY.—The public utilities of Victoria, Espirito Santo, Brazil, according to *Commerce Reports*, have been leased to the Servicos Reunidos de Victoria, S. A., which is controlled by George A. Hodge, who is an American. The lease covers the operation of a hydro-electric station, furnishing electricity for lighting and power, operation of tramways, telephone system, water supply and sewage system.

## New Apparatus and Publications

MOTOR STARTERS AND INDUSTRIAL SWITCHES.—The Square D Company, Detroit, has issued bulletins No. 20, No. 21 and No. 30, entitled "Motor Control Switches," "Wiring Data for Motors" and "Industrial Switches with Positive Quick Make and Quick Break and Cover Control Fused and Unfused" respectively.

PORCELAIN COVER FOR LINE TERMINALS.—A new porcelain cover for line terminals has been developed by the Square D Company, Detroit.

PUMP VALVE.—A new pump valve known as the "Seal" has been brought out by the Worthington Company, Inc., 115 Broadway, New York City.

PUMPING EQUIPMENT.—A leaflet distributed by the De Laval Steam Turbine Company, Trenton, N. J., describes and illustrates the "De Laval" pumping equipment in the new Baltimore refinery of the American Sugar Refining Company.

PANELBOARD.—The Benjamin Electric Manufacturing Company, 847 West Jackson Boulevard, Chicago, is distributing a circular covering its dead-front panelboard.

BENCH DRILL.—The Wisconsin Electric Company, Racine, Wis., has placed on the market a new sensitive drill known as the "Dumore" type "A" drill.

ELECTRIC INCUBATOR.—The Petaluma (Cal.) Electric Incubator Company has brought out an improved model of its electric incubator.

IRONING MACHINE.—The Modern Home Appliance Company, Kansas City, Mo., has added an electric ironing machine to its "Sieben" line of electrical laundry equipment.

WINDOW-DISPLAY DEVICE.—An animated window-display device, "Sellsem," has been brought out by the Animated Advertising Service, 130 West Forty-second Street, New York City.

BELL-RINGING TRANSFORMER.—A bell-ringing transformer "No. 77," designed for doorbells, buzzers, etc., has been developed by the Jefferson Electric Manufacturing Company, 426 South Green Street, Chicago.

OUTLET BOX.—A new collar-clamp outlet box, "Merrico," has been brought out by the Merrill Company, Ipswich, Mass.

## New Incorporations

THE GREEN & TAYLOR ELECTRIC COMPANY, Hazard, Ky., has been chartered with a capital stock of $10,000 by J. G. Green, H. T. and A. T. Taylor.

THE FARMINGTON (N. C.) ELECTRIC LIGHT COMPANY has been incorporated with a capital stock of $15,000 by E. C. James, W. E. Kennen and C. A. Hartman.

THE WELCOME (N. C.) LIGHT & POWER COMPANY has been incorporated with a capital stock of $50,000 by J. A. Johnson, Winston-Salem; W. O. Burgin, Lexington, and L. C. Ripple, Welcome.

THE LEAGUE CITY (TEX.) LIGHT & POWER COMPANY has been organized by W. M. Truxaw, E. T. Arnett and C. Trifon.

THE EVANS LIGHT & POWER COMPANY, Woodville, Tex., has been incorporated with a capital stock of $12,000 by T. E. and J. H. Evans and J. P. Lindsey.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

BOSTON, MASS.—The Edison Electric Illuminating Company will build an addition to its substation at East Boston, to cost $65,000.

BROCKTON, MASS.—The Edison Electric Illuminating Company contemplates extensions to its system.

EAST WALPOLE, MASS.—Electric power equipment will be installed in the proposed additions to the plant of Bird & Sons, Inc., to cost about $300,000. Monks & Johnson, 89 Chauncey Street, Boston, are architects.

WORCESTER, MASS.—The New England Power Company has been granted authority to issue $3,000,000 in capital stock, the proceeds to be used for a hydro-electric plant at Whitingham, Vt., erection of transmission lines, new substation at Lanesboro, etc.

HARTFORD, CONN.—The directors of the Connecticut Power Company have authorized an issue of $750,000 in capital stock to finance the erection of a 110,000-volt transmission line from the Agawam (Mass.) substation of the Turners Falls Power Company to the South Meadow plant of the Connecticut Power Company and a line from Hartford to New Britain.

NEW LONDON, CONN.—The Eastern Connecticut Power Company, it is reported, contemplates building an addition to its power plant at Uncasville, to cost about $400,000.

## Middle Atlantic States

CARMEL, N. Y.—The Carmel Light & Power Company contemplates extensions to its distributing lines. S. C. Dunning is treasurer and general manager.

COHOES, N. Y.—The installation of a 10,000-hp. generating unit is under consideration by the Cohoes Power & Light Corporation.

JAMESTOWN, N. Y.—The installation of two 500-hp. water-tube boilers with stokers and accessories in the municipal electric light plant and the erection of a 200-ft. radial brick chimney are under consideration by the Department of Water and Lighting. Melvin O. Swanson is general superintendent.

NEW YORK, N. Y.—Electric power equipment will be installed in the proposed ice-manufacturing and refrigerating plant of the Lion Brewery of New York at Ludlow and Whitlock Avenues, to cost about $400,000. Adolph G. Koenig, 405 Lexington Avenue, is architect.

UTICA, N. Y.—Plans for the proposed addition to the plant of the Munson Mill Machinery Company include a power house. The cost is estimated at $400,000. Charles Kiehm, Gardner Building, is architect.

WATERTOWN, N. Y.—Bids will be received by the Power Corporation of New York, Northern New York Trust Company Building, until April 10 for additional hydro-electric development at the Northern Utilities plant at Effley Falls. The work will include extensions to the present power station to house a 2,000-hp. generating unit, etc. Bids will also be received at the same time for a hydro-electric development at Flat Rock site on the Oswegatchie River, to develop 4,000 hp. W. P. Creager is chief engineer of the company.

YORKSHIRE, N. Y.—The Niagara, Lockport & Ontario Power Company, Buffalo, plans to erect a transmission line to Yorkshire and to install a substation here for light and power service in this district.

BAYONNE, N. J.—The Standard Oil Company of New Jersey, it is reported, will build a power plant at its local oil refinery, to cost about $500,000.

HAMMONTON, N. J.—The installation of a new substation, connecting with the Atlantic County Electric Company by means of a 22,000-volt transmission line and extensions and repairs to its distribution lines are under consideration by the Hammonton Electric Light Company. Charles A. Berry is manager.

NEWARK, N. J.—The Public Service Corporation plans to build a substation at 1223 Broad Street, to cost about $100,000.

ALTOONA, PA.—The Pennsylvania Railroad Company will install electric power equipment in the proposed machine and locomotive repair shop, to be erected at its local yards, to cost about $1,000,000.

ERIE, PA.—The Erie County Electric Company contemplates the extension of its 13,800-volt system for tie-line service and power customers and the erection of a substation at Twelfth Street and Pennsylvania Avenue. Contract has been awarded for the construction of a switch house at Twelfth and French Streets. P. G. Sturtevant is general superintendent.

HARRISBURG, PA.—An electric power plant for emergency service will be installed in the proposed operating building to be erected by the Bell Telephone Company at Pine and Court Streets, to cost about $2,000,000.

MEADVILLE, PA.—The installation of an ornamental lighting system on the main streets, to cost about $25,000, is under consideration.

PHILADELPHIA, PA.—The La France Textile Company, 4423 Frankford Avenue, plans to build a one-story power house.

PHILADELPHIA, PA.—The Philadelphia Electric Company has acquired a site on the Delaware River, near Ontario Street, as a site for a power plant.

PHILADELPHIA, PA.—Electric power equipment will be installed in the proposed addition to be erected by the W. H. McCahan Sugar Refining Company, Tasker Street, to cost about $400,000.

TOWANDA, PA.—The Towanda Gas & Electric Company will install a 375-kva. unit and a switchboard this summer. D. R. Smith is vice-president and superintendent.

WILKES-BARRE, PA.—The Wilkes-Barre & Hazelton Railway Company will build a transmission line to connect with the system of the Pennsylvania Power & Light Company, from which electricity will be secured.

WILLIAMSTOWN, PA.—The East Penn Electric Company has applied for permission to purchase the property of the Lykens Valley Light & Power Company and the Pine Grove Electric Light, Heat & Power Company. Extensions and improvements to the systems are contemplated.

CHARLESTON, W. VA.—The Dewey Furniture Manufacturing Company plans to install a power house in connection with

the rebuilding of its plant, recently damaged by fire, causing a loss of about $100,000.

KEYSER, W. VA.—The Keyser Electric Company contemplates increasing its output either by the installation of a new plant or the purchase of power. E. W. Lothrop is president.

MARTINSBURG, W. VA.—The Potomac Light & Power Company will erect a new 33,000-volt transmission line from Martinsburg to connect with the new steam plant of the Potomac Public Service Company at Williamsport, Md., this spring. W. M. Krise is general superintendent.

PIEDMONT, W. VA.—Renewal of its transmission lines and extending its lines to coal mines for motor service is under consideration by the Piedmont Electric Light & Power Company. Norris Bruce is secretary.

STUART, W. VA.—W. H. Clark, owner of the local electric plant, expects to replace the 50-kw. generator with a 75-kw. to 80-kw. machine, waterwheel type preferred. He may also add another waterwheel.

WASHINGTON, D. C.—Plans are being prepared by Stone & Webster, Inc., 147 Milk Street, Boston, for extensions to the Bennings Road Power Station of the Potomac Electric Power Company, to cost about $1,500,000. The equipment will include 20,000-kw., 60-cycle, 13,200-volt turbine generators, three 1,400-hp. boilers, etc.

WASHINGTON, D. C.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, until April 24 for 250 storage batteries for use at the Philadelphia and Pensacola (Fla.) navy yards. (Schedule 742.)

## North Central States

DETROIT, MICH.—Bonds to the amount of $12,000,000 have been approved by the voters for the construction of a new municipal electric light and power plant and $5,000,000 for street-railway extensions.

SEBEWAING, MICH.—Arrangements are being made for installing new equipment in the municipal electric light plant, for which contract has already been placed. The system will be changed from direct to alternating current. H. J. Davis is superintendent.

CLEVELAND, OHIO. — The Cleveland Electric Illuminating Company is planning to install one additional 25,000-kw., one 30,000-kw. Curtis turbine and four additional boiler units of 3,060 b.hp. each, together with necessary transmission and distribution lines. Robert Lindsay is president and general manager.

MOUNT GILEAD, OHIO. — The Mount Gilead Water, Light, Heat & Power Company will connect with the transmission line of the Morrow Public Service Company and purchase energy for local service. The present steam plant will be held for emergency service. L. C. Dye is secretary.

SABINA, OHIO.—The three-phase high-tension lines of the municipal electric system may be extended and transformers installed for power service. J. C. Phelps is superintendent.

AURORA, ILL. — The Western United Gas & Electric Company has issued $1,323,000 in bonds, part of the proceeds to be used for extensions and improvements.

ALMA, WIS.—New transformer installations and changes in the local light and power distribution system are under consideration by the Wisconsin-Minnesota Light & Power Company.

BUTTERNUT, WIS. — The Butternut Electric Light & Power Company will install an additional engine and generator and will rebuild some lines. W. J. Schulz is president and manager.

LA CROSSE, WIS. — The Wisconsin-Minnesota Light & Power Company has issued $323,750 in capital stock, part of the proceeds to be used for extensions and improvements.

OCONTO, WIS.—The Northeastern Power Company is considering improvements to its Peshtigo water-power station, to cost about $25,000, and also improvements to the local distribution system, to cost about $50,000. Both properties were recently acquired by the company.

PRAIRIE FARM, WIS. — The Prairie Farm Electric Company is planning to change its plant from direct current to alternating current, 2,200 volts, three-phase, 60 cycle. J. A. Helland is president and manager.

RIVER FALLS, WIS.—The installation of a 200-hp. oil engine to operate a 175-kva. alternator in the municipal electric power house is under consideration. F. V. Williams is city clerk.

ELKADER, IOWA.—The People's Electric Service Company contemplates a new hydro-electric development, the erection of about 20 miles of transmission lines and the installation of distribution systems for rural service. W. C. Reimer is secretary and treasurer.

HARTLEY, IOWA.—The Municipal Electric Light Department contemplates erecting a number of rural lines this summer. Fred A. Raasch is superintendent.

OSKALOOSA, IOWA. — Bonds to the amount of $370,000 have been voted for the installation of a municipal electric light plant.

HIGGINSVILLE, MO. — The Board of Water and Light Commissioners is considering buying power from the Kansas City Power & Light Company or purchasing additional equipment for the municipal electric plant during the coming year. O. L. Hebbler is superintendent.

KANSAS CITY, MO. — The American Paper Manufacturing Company contemplates the construction of a power house in connection with a new mill at North Kansas City, to cost about $100,000.

MONETT, MO.—The St. Louis-San Francisco Railroad Company will install electric power equipment in connection with the rebuilding of its local shops, recently destroyed by fire, with loss of $350,000.

ORAN, MO.—Plans are being prepared for a municipal power plant and waterworks, to cost about $40,000. W. A. Fuller, Railway Exchange Building, St. Louis, is engineer.

CROSBY, N. D.—The erection of a high-tension transmission line from Noonan to Crosby is under consideration by the Crosby Light & Power Service. K. S. Huso is manager.

STANLEY, N. D. — The Public Utility Company contemplates erecting a new pole line and distributing system. R. F. Wherland is manager.

ASHTON, NEB. — Extensions to the street-lighting system are under consideration by the Council.

CODY, NEB.—Plans are being prepared for the erection of a transmission line for local service. The municipal lighting plant will be closed down.

FAIRBURY, NEB.—The installation of one 1,500-ft. or 2,000-ft. surface condenser in the municipal electric light plant is under consideration. G. D. Myers is manager.

HARRISON, NEB.—Extensions and improvements are contemplated to the municipal electric light plant, including the installation of a 75-hp. Fairbanks engine and a 60-kva. generator, and changing the system from single-phase to three-phase. T. L. Iversen is superintendent.

ORLEANS, NEB.—The Light and Power Department contemplates extending the municipal transmission lines to Stamford, a distance of 8 miles. N. E. Lideen is manager.

ANTHONY, KAN. — The Anthony Salt Works, Inc., plans to rebuild its power house and mill, recently destroyed by fire, causing a loss of about $250,000.

HUMBOLDT, KAN. — The Humboldt Light & Power Company contemplates the erection of 21 miles of transmission line to take in the towns of Lone Elm, Kincaid and Blue Mound. Work is under way on the construction of a dam and power plant at Neosha Falls, to develop 300 hp. Dwight C. Diver is secretary and treasurer.

INDEPENDENCE, KAN.—Bids will be received by Hugh W. Crawford, city engineer, until May 1 for three motor-driven centrifugal pumps, one of 1,550 gal. per minute and two of 775 gal. per minute, with necessary electric equipment, etc.

WICHITA, KAN.—Plans are under way for the construction of a co-operative power plant, to cost about $150,000. D. S. Jackman, 715 East Thirteenth Street, is interested.

## Southern States

ALBEMARLE, N. C.—The Almond Light & Power Company contemplates extensions at its local power plant. Substations will be built at New London and Richfield, and transmission lines will be erected.

CHAPEL HILL, N. C.—The installation of an engine-driven generating unit of 300 kva. or 500 kva. capacity in the university power plant is under consideration. J. S. Bennett is general superintendent.

COOLEEMEE, N. C.—The Cooleemee Ice & Laundry Company plans to construct a power house in connection with a new ice-manufacturing plant.

WALLACE, N. C.—The Tidewater Power Company plans to erect a transmission line to Wallace and a line from Warsaw to Clinton, about 70 miles.

CLINTON, S. C.—The Lydia Cotton Mills contemplates the construction of a power house in connection with a new mill, to cost $750,000.

MACON, GA.—The Massee & Felton Lumber Company contemplates the construction of a power house in connection with the rebuilding of its mill, recently destroyed by fire.

CLEARWATER, FLA.—The Clearwater Lighting Company has arranged for a merger with the St. Petersburg (Fla.) Light Company. Extensions and improvements will be made in the systems.

MIAMI, FLA.—The Tropical Radio Company plans to erect a wireless terminal plant at Hialeah, near Miami, to cost about $250,000, including power plant and equipment.

CHATTANOOGA, TENN.—The directors of the Tennessee Electric Power Company have authorized an expenditure of $1,800,000 for further development of the hydro-electric plant at Great Falls.

CLEVELAND, MISS.—The Home Light & Ice Company contemplates the erection of a transmission line to Boyle to supply electricity to the Boyle Electric Light Company. F. G. Proutt is treasurer.

GLENMORA, LA.—The Glenmora Power Company, Inc., contemplates installing another generating unit this year, consisting of a 100-hp. oil engine and generator. T. L. McNicoll is treasurer and manager.

WELSH, LA. — Improvements are contemplated to the municipal electric plant during this year, including the installation of an 180-hp. engine (Busch Sulzer Brothers) and probably an ice plant of from 10 to 15 tons capacity. John F. Smith is superintendent.

CUSHING, OKLA.—The Illinois Refining Company plans to install electrically operated pumping plants in connection with a 60-mile pipe line to the Tonkawa oilfields, to cost about $200,000.

FORGAN, OKLA.—Plans are being considered for the installation of a 100-hp. Fairbanks-Morse oil engine directly connected to a 60-kw. alternator, also to erect 1 mile of new pole line and about 16,000 ft. of new copper wire. E. E. Crites is superintendent.

SULPHUR, OKLA.—The Oklahoma Light & Power Company has acquired the local power plant. It will be remodeled for a substation. A transmission line will be erected from Pauls Valley.

TULSA, OKLA.—The Prest-O-Lite Company, Indianapolis, Ind., contemplates the construction of a power house at its proposed local plant for acetylene gas production, to cost about $250,000.

TULSA, OKLA.—The Texas Company, New York, contemplates extensions to its power plants in connection with proposed additions to its oil refineries at West Tulsa, Port Arthur and Port Neches, Tex.; Lockport, Ill., and Casper, Wyo. An appropriation of $10,000,000 has been made.

FENTRESS, TEX.—The Fentress Gin Company contemplates changing its electric system from direct to alternating current. J. C. Dauchy is manager.

FORT WORTH, TEX. — The National Lumber & Creosoting Company, Houston, plans to build a power plant in connection with its proposal local wood treatment works, to cost about $100,000.

FORT WORTH, TEX.—Electric power equipment will be installed in the printing plant to be erected on Jones Avenue near Second Street by the World Company, Inc., to cost about $500,000.

MIDLAND, TEX.—The Midland Light & Power Company plans to build an addition to its power plant, to cost about $25,000. Transmission lines will be erected to Odessa and vicinity.

NOCONA, TEX. — The Nocona Ice & Light Company contemplates installing a 150-hp. engine and generator and to erect transmission lines to towns off the line to Terrall and Ringgold. J. W. Lehman is president and manager.

RISING STAR, TEX.—The Rising Star Light & Power Company plans to install additional 80-hp. gas engine directly connected to generator and to extend its service mains. Wright L. Felt is president.

## Pacific and Mountain States

LONGVIEW, WASH. — The Long Bell Lumber Company, Kansas City, Mo., contemplates the construction of a power plant in connection with its proposed mills, to cost about $1,500,000.

WASHOUGAL, WASH. — The Western Light & Power Company contemplates the erection of 6 miles of transmission line, using No. 2 bare copper wire. C. W. Cottrell is president.

DAYVILLE, ORE.—Application has been filed at the office of the State Engineer by H. H. and R. B. Cummings to appropriate 15 second-feet of water from the south fork of the John Day River for irrigation and power purposes. The project includes a dam, 4.4 miles of ditch, a Hunt turbine and a 200-kw., 60-cycle alternator. The cost is estimated at $25,000.

EUGENE, ORE.—The installation of an 1,800-hp. generating unit in the municipal electric plant is under consideration. C. A. McClain is secretary and superintendent.

ALHAMBRA, CAL.—E. K. Davis and associates plan to build a hydro-electric plant on Deer Lake.

ARROYO GRANDE, CAL.—Steps have been taken for the installation of an ornamental lighting system.

CORNING, CAL. — The Pacific Gas & Electric Company will make extensions and improvements to its local system, including the installation of new lamp standards, to cost about $53,600.

FRESNO, CAL.—Bids will soon be asked for the installation of an ornamental lighting system, consisting of ninety-nine single-lamp standards, to cost about $25,000.

FRESNO, CAL.—The San Joaquin Light & Power Corporation will build a mechanical plant at Orange and California Streets, including a meter-testing and repair shop, transformer-testing station, transformer warehouse, pole-treating plant, cross-arm mill and machine shop, to cost about $300,000.

LOS ANGELES, CAL. — The Southern California Edison Company contemplates an expenditure of $26,000,000 for extensions and improvements during the present year as follows: $11,851,000 for hydro-electric power development, $4,149,000 for substations and transmission lines, $265,000 for steam and water-power plants, $6,800,000 for distributing lines and stations, $1,400,000 for miscellaneous equipment, and $1,535,000 for low-voltage transmission lines.

SAN FRANCISCO, CAL.—F. B. Cross, care of Rudolph W. Van Norden, Mills Building, engineer, has been granted permission to construct a hydro-electric plant on Deer Creek, Tehama County, to develop 18,600 hp., to cost about $1,700,000.

SAN FRANCISCO, CAL. — The Utica Mining Company, 575 Mills Building, plans to install a hydro-electric plant on Highland Creek, Tuolumne County, to develop 3,300 hp., at a cost of about $150,000.

ST. GEORGE, UTAH.—The Dixie Power Company has applied to the State Engineer for permission to divert 30 cu.ft. of water from the Santa Clara River in Washington County for power purposes. The plans call for a development of 800 hp. and will include a channel 30,450 ft. to divert the water and a 5-ft. Pelton waterwheel.

LIBBY, MONT.—The Libby Water & Electric Company contemplates building a dam, 50 ft. high and also the installation of a second-hand 250-kw., three-phase, 2,300-volt generator and Pelton waterwheel and may possibly purchase about 2,000 ft. of 24-in. conduit or pipe to carry 250 ft. static head. Judson Bibb is manager.

STOCKTON, CAL.—The Western Gas & Electric Company is building a new hydro-electric plant on the South Fork of the American River, to have an ultimate capacity of 100,000 hp. The initial unit of 27,000 hp. will be completed by the latter part of this year. B. F. Wellington, Jr., is secretary and treasurer.

WORLAND, WYO.—The Big Horn Light & Power Company contemplates installing two 100-kw. generators, directly connected to generators, and the erection of transmission lines from the hydro-electric plant to Worland; also to install two 50-kw. natural-gas units this summer. M. W. Thompson is secretary and manager.

KEMMERER, WYO.—The Frontier Supply Company contemplates the installation of a 2,000 kw. Curtis turbo-generator unit. P. J. Quealy is president and manager.

SANTA FE, N. M.—The Santa Fé Water & Light Company is installing a 500-kw. Curtis steam turbine. A. J. Griffin is manager.

## Canada

EDMONTON, ALTA. — The Department of Railways and Telephone contemplates 1,500 miles in telephone extensions, to cost about $800,000.

BARRIE, ONT. — The installation of about 6,000 ft. of underground work is under consideration by the municipal electric light department. J. A. Hare is superintendent.

CAMPBELLFORD, ONT. — The Hydro-Electric Power Commission of Ontario contemplates a 10,000-hp. development at Dam 8 on Trent River, near here, to cost about $1,066,000. F. A. Gaby is the chief engineer.

FORD, ONT.—The Town Council is considering an issue of $26,000 in debentures for extensions to the local Hydro-Electric system.

PARIS, ONT.—The Hydro-Electric and Water Commission contemplates increasing the transformer capacity of substation. Fred Bishop is secretary and treasurer.

TORONTO, ONT. — The Hydro-Electric Power Commission of Ontario is planning to erect a 100-mile steel-tower transmission line from Niagara Falls to St. Thomas, to cost about $1,000,000. F. A. Gaby is chief engineer.

TORONTO, ONT.—Extensions and improvements to lighting and power systems, to cost about $2,000,000, are under consideration by the Toronto Hydro-Electric System, to include transformers, wire, cables, concrete poles, etc.

WALKERVILLE, ONT.—The City Council has granted the petition of the local Hydro-Electric Commission for an appropriation of $50,000 for extensions to the Hydro-Electric system this year.

YORKTON, SASK. — Extensions to the municipal electric system, to cost about $100,000 are under consideration.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued March 20, 1923)

1,449,167. DISCHARGE TUBE FOR ELECTRICAL APPARATUS; G. Collins, Chicago, Ill. App. filed Sept. 30, 1920. For medical applications.

1,449,201. ELECTRIC FLATIRON; A. H. Smith, New York, N. Y. App. filed April 14, 1921. Control switch operated by handle.

1,449,202. STREET-CAR BARN; W. F. Snohr, Chicago, Ill. App. filed Feb. 10, 1922. Providing means for quickly moving cars in case of fire.

1,449,206. METHOD OF AND APPARATUS FOR HEAVY SPOT WELDING; J. M. Weed, Schenectady, N. Y. App. filed Nov. 29, 1920. For spot welding heavy plates and structural parts.

1,449,239. CONTROLLER FOR ELECTRIC MOTORS; N. L. Mortensen, Milwaukee, Wis. App. filed May 31, 1921. Controller adapted for series-parallel commutation of plurality of motors.

1,449,248. COMINATION LOCKING MECHANISM; G. D. Rathbun, Kansas City, Mo. App. filed Sept. 14, 1921. Electromagnetic combination locking mechanism for doors.

1,449,249. RHEOSTAT; J. T. Rhamstine, Detroit, Mich. App. filed Aug. 8, 1922. Filament rheostat for radio sets.

1,449,251. ELECTRIC FURNACE REGULATOR; J. A. Seede, Schenectady, N. Y. App. filed Feb. 4, 1920. Automatic control of electrodes.

1,449,253. UNIDIRECTIONAL RECEIVING SYSTEM; M. S. Strock, Washington, D. C. App. filed Sept. 23, 1921. Circuit employs two tubes.

1,449,278. ELECTRIC IRON; A. Fleming, Alexandria, Va. App. filed Feb. 10, 1921. Automatically controls current.

1,449,305. APPARATUS FOR TEACHING TELEGRAPHY; E. H. Snyder, Baltimore, Md. App. filed July 15, 1921.

1,449,307. ELECTRIC FURNACE; L. Tagliaferri, Genoa, Italy. App. filed March 25, 1920. Arrangement of electrodes for supplying and distributing current.

1,449,319. PROCESS OF MELTING AND DEOXIDIZING STEEL; A. E. Greene, Seattle, Wash. App. filed May 3, 1916. Treating with special slag in electric furnace.

1,449,357. FILTER INDICATOR FOR X-RAY SYSTEMS; H. F. Waite, New York, N. Y. App. filed Sept. 28, 1921. Indicates whether undesired waves are passing through screen.

(Issued March 27, 1923)

1,449,370. CURRENT-CONTROLLING DEVICE; V. G. Apple, Dayton, Ohio. App. filed Jan. 17, 1919. Combined starting switch, automatic current regulator and overload and underload cut-out for automobile generators.

1,449,371. METHOD OF CONSTRUCTING ARMATURES FOR DYNAMO-ELECTRIC MACHINES; V. G. Apple, Dayton, Ohio. App. filed Sept. 15, 1919. Windings of armature inclosed in refractory insulating armor.

1,449,372. SYSTEM OF TELEPHONY; H. D. Arnold, East Orange, N. J. App. filed Dec. 1, 1915. Wireless signaling by means of modulated high-frequency waves or currents.

1,449,382. METHOD AND MEANS FOR SIGNALING WITH HIGH-FREQUENCY WAVES; J. R. Carson, New York, N. Y. App. filed Dec. 1, 1915. Similar to Squier high-frequency telephone system.

1,449,391. COMBINATION FLASHLIGHT AND TOILET ARTICLE; L. Franklin, New York, N. Y. App. filed March 9, 1922. Electrically lighted vanity case.

1,449,406. ELECTRIC HEATER; M. E. Householder, Pittsburgh, Pa. App. filed Oct. 29, 1921. Resistance-wire water heater.

1,449,425. HEATING SYSTEM FOR TYPESETTING MACHINE CRUCIBLES AND THE LIKE; E. N. Lightfoot, New York, N. Y. App. filed Oct. 10, 1916. Automatically governs electric heaters for linotype pots.

1,449,437. FLOW METER; J. A. Obermaier, Chicago, Ill. App. filed Jan. 2, 1918. Totalizing meter operated by pilot tubes in pipes and variable resistance.

1,449,460. CLAMP FOR BINDING SCREWS AND THE LIKE; B. G. Thomas, Bridgeport, Conn. App. filed Dec. 20, 1918. For lamp sockets, switches, cut-outs, etc.

1,449,462. METHOD AND APPARATUS FOR THE ELECTROLYTIC RECOVERY OF COPPER; G. D. Van Arsdale, New York, N. Y. App. filed Sept. 24, 1920. Precipitation of copper from mine waters.

1,449,487. TELEPHONE SYSTEM; E. M. Ashworth, Toronto, Ontario, Can. App. filed April 7, 1920. Automatic-exchange.

1,449,500. CONTROLLING MECHANISM FOR ELECTRIC MOTORS; W. Davis, Chicago, Ill. App. filed June 12, 1922. Speed governor for automobile motors.

1,449,501. TELEGRAPH INSTRUMENT; O. R. Dorris, Harney, Minn. App. filed Aug. 1, 1921. Telegraph sounder operated directly by current from main circuit.

1,449,511. TELEPHONE SYSTEM; H. H. Ide, La Grange, Ill. App. filed Feb. 14, 1919. Two-wire type where directively controlled switches are operated by subscribers' circuits.

1,449,517. HEATING IRON FOR MELTING PLASTIC SUBSTANCES; H. F. Lame, Jersey City, N. J. App. filed March 28, 1922. Wax, glue, etc., electrically heated and melted in tube from which it is applied to object.

1,449,539. DYNAMO-ELECTRIC MACHINE; A. H. Neuland, Jersey City, N. J. App. filed Aug. 21, 1920. Electric transmission for automobiles.

1,449,557. RHEOSTAT; L. A. Seiss, Toledo, Ohio. App. filed May 6, 1922. Vacuum-tube-filament rheostat.

1,449,573. CONTROLLING SYSTEM; W. P. Albert, Newark, N. J. App. filed May 1, 1920. Control of step-by-step telephone equipment.

1,449,577. DYNAMO-ELECTRIC MACHINE; C. O. Bergstrom and P. de Clamecy, Boston, Mass. App. filed Aug. 18, 1919. Construction of fractional-horsepower motors that reduces their weight.

1,449,578. FURNACE REGULATOR SYSTEM; C. A. Boddie, Pittsburgh, Pa. App. filed June 25, 1919. Control of electrodes.

1,449,579. FURNACE REGULATOR SYSTEM; C. A. Boddie, Pittsburgh, Pa. App. filed Nov. 6, 1919. For governing movable electrodes of electric furnaces.

1,449,593. FURNACE REGULATOR SYSTEM; R. D. Evans, Wilkinsburg, Pa. App. filed Oct. 30, 1918. Movable electrodes automatically raised and lowered.

1,449,627. ELECTRIC INCANDESCENT LAMP; E. Rohner, Rheineck, Switzerland. App. filed Dec. 14, 1921. Two-filament lamp.

1,449,632. ELECTRIC WAVING IRON; E. R. Talbot, Chicago, Ill. App. filed March 6, 1922.

1,449,644. TELEPHONE SYSTEM; C. White, East Orange, N. J. App. filed Dec. 30, 1919. Signaling circuit wherein simplexed physical lines are utilized.

1,449,658. ELECTRIC LAMP FIXTURE; M. F. Deach, Oakland, Cal. App. filed Oct. 27, 1920. Extension-arm lamp.

1,449,694. PROTECTIVE DEVICE; F. W. Peek, Jr., Pittsfield, Mass. App. filed Sept. 18, 1919. Resistance between transmission line and insulator for protection against surges.

1,449,722. HIGH-FREQUENCY SIGNALING SYSTEM; W. R. G. Baker, Schenectady, N. Y. App. filed Sept. 17, 1921.

1,449,725. ELECTRICAL APPARATUS; F. R. Beckert, Schenectady, N. Y. App. filed Oct. 18, 1921. Potentiometer for electron tubes.

1,449,746. ELECTRIC BATTERY OR ACCUMULATOR; W. H. Exley, Woking, and G. H. Handasyde, West Byfleet, England. App. filed Jan. 6, 1923. Arrangement of electrodes in minimum space.

# Thinking Ahead

GOOD fortune has played a large part in the prosperous development of the electrical industry. Steam and electric railways and gas companies have all seen slumps come in the market for the services they render. But there has been no setback in the demand for electric light, heat and power. There may not be for many years. The convenience, the flexibility, the adaptability and the cheapness of electrical service are the reasons.

But the electrical industry cannot be content to await expansion and progress through the influence of accident or fortunate environment. The great majority of men attain their position and prosperity through sheer merit, the constructive application of their brains and imagination. And so it is with an industry. It must plan and promote its evolution as well as concern itself with the activities of the day.

There are tremendous possibilities for service and achievement in the electrical industry. Problems and opportunities of the past are overshadowed by the problems and opportunities of the future. But, just as truly, the possibilities for disaster are equally tremendous if the fabrication of the great structure which the future will reveal is left too much to chance or unsound thinking.

Today's problems of engineering, operating and financing electric power systems are absorbing. And there are questions of public relations, of selling equipment to present customers, of wiring buildings, now at hand. But these activities are actually preparatory. The great conceptions of complete water-power development, of fuel utilization at the mines for conversion into electric power, and of great interconnected superpower systems that will serve the entire land at maximum efficiency—these are all preparatory.

History will some day write the record of this industry in terms of the service which electricity has rendered to mankind, its contribution to civilization. It will list the complete electrical equipment of industry, of the home and of the farm and the establishment of universal communication as its great achievements. These are the objectives—toward them there should be the best constructive study and thinking. Whether it is in power generation, transmission or distribution, in finance or in merchandising, there are many large problems which should be clearly formulated, the proper solution to which will have an all important bearing on the future realization of today's hopes. Even though in the midst of present pressing problems, specific and co-ordinated study of the problems connected with the future's structure should be energetically pursued. Definite planning ahead even ten years would be a great advance. No more important work can be done by the industry's organizations if the work of today is to build adequately and soundly for the future.

# Charles Leo Eidlitz

*A successful and prosperous electrical business man who has devoted himself for years to the betterment of the electrical contractor.*

THE progress of the electrical industry has been achieved locally. Great central power stations may serve broad areas and scattered populations, but it is in the homes and business places of the communities that new and more applications of electricity are effected and that actual industry growth is realized. The electrical contractor—the man who wires buildings for the introduction and the use of electric service—is therefore an important element to all the industry. All are greatly concerned that he should prosper and expand. No man in the country has done more or is doing more today, however, to mold this contractor into the better instrument needed for the advancement of electrical progress than Charles L. Eidlitz, recently appointed a special commissioner to act as the Judge Landis of the electrical contractors of New York.

Mr. Eidlitz has had an interesting and useful career. Born in 1866 in New York City, he came to manhood just at the time when the first popular wonders of electricity were unfolding. While a student at Columbia he decided to become an electrician and joined the old Bergman Electric Works. From there he shifted to the Edison Machine Works when Edison and Sprague were carrying on their experiments there. Then he became inspector of installations for the Edison United Manufacturing Company and then joined the Edison Wiring Company.

With two others he later organized an independent contracting company which he acquired in 1889 and renamed the Charles L. Eidlitz Company. This company he developed into an exceedingly prosperous business. In 1913 he turned it over to his employees. Meanwhile he had also become interested in manufacturing and general sales through the purchase and expansion of the Metropolitan Electric Manufacturing Company and the Charles E. Corey Company, of which he is now head.

Mr. Eidlitz has devoted a large amount of time and effort to trying to make a better business man of the electrical contractor. In 1892 he organized the first local association of electrical contractors in America. Shortly afterward he helped organize the first state association of contractors and in 1901 was the first president of the National Association of Electrical Contractors.

### Right to a Reasonable Return Again Upheld

THE decision of the United States Supreme Court in the case of the Public Service Commission of New York vs. New York Telephone Company serves again to remove from ambiguity and doubt the right of a public utility to appeal to the federal courts for relief from rates deemed by it to be confiscatory. It was the contention of the Public Service Commission of New York that the utility, instead of applying to the federal courts for an injunction, should first have asked the commission to reopen the hearings and in case of a refusal an appeal should have been taken to the state courts. That it was not necessary under the law as it exists for the utility to apply to the commission for a rehearing before resorting to the federal courts was very clearly set forth by the Supreme Court. The decision of the court, which was unanimous and reaffirmative of the right of a utility to a fair and reasonable return on its investment, should once more set at ease the minds of commissions, utilities and the public on a point which cumulative decisions have definitely removed from the realm of peradventure.

### America Not Alone in Rural-Service Problem

THE facilitation of the use of electrical energy in agriculture is not exclusively an American problem. The technical press of other countries contains editorial and contributed articles that, with a few changes in phraseology to conceal the locality in which they were written, could be published in the United States without a suspicion that they were not written to describe our own conditions.

The English technical press is discussing the problem of how to finance farm lines when the rural use of energy as compared with its urban use is so small. Fear to put the rates at a point which will make the service stand on its own merits is exhibited, and the lack of equipment and methods which will allow the farmer to use a large volume of energy is apparent. The French government is reported to have provided one-third of a huge subsidy, the other two-thirds of which is to be provided by agricultural organizations. With this sum the necessary distribution lines to afford service to French farmers will be built. Germany and the Scandinavian countries are also wrestling with the rural-service problem.

All this indicates that agriculture in the civilized world is looking to the electrical industry for some of the help that electricity has already given industry in general. No one as yet knows just how that help is to be given; but every one who has given the movement careful thought knows that if the help shall be forthcoming, it will mean a real revolution in agricultural production methods. American agricultural engineers of standing take the position that a proper development of the use of electrical energy on the farm will be the biggest step forward that agriculture has ever taken, because it means bringing home to the farmer the importance of the entire farm-power problem as a factor in more economical production. These men point out that, with human labor costs constantly rising and with living conditions on an ascending plane, the problem of the farmer, like that of the manufacturer, is to increase the productive ability of the human worker by taking from him the tasks that mechanical equipment can accomplish much more economically so that he can devote his time to keeping machines at work.

It is the old industrial question of labor-saving machinery in a new guise, and the electrical industry is being urged to solve the problem because of the part it has played in solving the same problem for other industries.

### New Two-Rate System Brings Desirable Results

THAT a form of rate for residential service containing a fixed charge for which the customer receives no energy cannot be made successful is a pet hobby which many central-station men have ridden for years. Attempts to hide the fixed costs by spreading them over the first units of energy consumption have been made, and, to protect the utility from loss due to the consumer who refuses to use enough energy to return to the company its fixed costs of service, some form of minimum charge is usually imposed. Most of these methods seem to have been unproductive in the way of the development of energy use on the part of the consumers, and on many systems, particularly the smaller central stations, they seem to have created a large body of consumers who are not carrying their fair share of the costs of service. In one way or another the deficit is made up at the expense of other classes of consumers.

That the problem can be successfully attacked in another way is rather strikingly indicated by the experience of the past year at Hartford, Conn. A rate consisting of a flat charge for which no energy is given, plus a low energy rate, was substituted for a straight-line meter rate that apparently did not encourage an increase in energy consumption among residential consumers. The new rate is of a form that has been used before in other communities; that is, nothing absolutely original in the way of rate structure is claimed. But that the new rate has been successfully "put over" to supersede an old 10-cent flat rate is indicated by the fact that after a year's trial less than two-tenths of 1 per cent of the residential customers asked to go back to the old form of rate, restitution of which was promised by the company if the consumers requested it at the end of the year. The manner in which this result was obtained was a triumph of

diplomacy. The curve of increased consumption shows a better shape than under the old rate.

The big lesson in the situation is the way in which it was handled. Nothing mysterious was attempted—just plain, straightforward laying of the cards on the table on the assumption that the people of the community were competent to judge the merits of the whole proposal. Judicious and continuous effort to show the consumers how to use the new rate form profitably to themselves is the other half of the story. No politics, no sleight-of-hand or back-room work—just plain, straightforward business.

The question of a proper residential rate is still, after all the years of experience and experiment, an unsettled one. Other things being equal, the simpler the rate, the better. While Hartford's new rate is not the simplest possible, yet the experiment is illuminating and the story is worth careful study on the part of central-station executives plagued with the problem of a large body of consumers who are not using the energy they can afford and who are deterred by rate forms that impose a penalty for increased use rather than encourage it.

## Refinements Worth While in Hydro-Electric Plant Design

THE more one studies hydro-electric plant design, the clearer it becomes that this is no work for the "catalog engineer." This conclusion is not based upon recent advances in prime-mover development, striking though they have been. What might be called the structural side of water-power installations is receiving increased attention from engineers as well as the problems connected with the selection and regulation of generating units, and it is a question whether utility executives in general appreciate the refinements which are now considered essential for analysis by competent technical minds charged with the task of conserving water for efficient use in electric systems.

Old as the development of water power by the use of dams and reservoirs is, there are many unsolved problems here. Off-hand judgments as to the type of dam best suited to particular cases have no place in the budget of a modern hydro-electric installation. The most skilled engineering opinion is essential upon such points as the allowance to be made for upward pressure, the design of waste gates, the provision for automatic, non-automatic or combination flashboards, and the desirable shape of intakes, scroll cases and rack sections. These may be the problems of the civil engineer, but electrical and mechanical men should also consider them in station development and be prepared to discuss them intelligently in striving for a well-balanced layout. There is a growing consensus of opinion that the sheet of waste water discharged over the crest should be closely conformed to the down-stream surface of a dam, for aside from the possibilities of increased erosion where there is a gap between the dam and the water, in some cases lately mechanical disturbances to neighboring windows and buildings have been noticed which should be eliminated. Operating difficulties arising from improper gate design may become very burdensome, and more attention should be paid to obtaining high-quality castings, anchor bolts of tested material, stop-log slots of fabricated shapes of adequate dimensions, duplex gate stems and sectionalized runways around headworks and forebays. In many instances the ordinary commercial sizes of channel irons are too thin for the best results in stop-log guides, a plate and angle design giving more reliable service. It is an expensive and difficult job, as a rule, to repair submerged structures.

From the intake at the dam to the tailrace, hydraulic experts are studying the shape of all water passages with intense interest. Even the cross-section of trash-rack bars is being analyzed, and in some jobs rounded corners and even special shapes to reduce friction losses are now specified. It may seem meticulous to put high-priced time upon such a question as the desirable angle between the axes of rack bars and the line of advance of the water stream in taking off, for instance, a lateral discharge from a canal to penstocks or wheel inlets; but in a large development with restricted storage facilities all reasonable means of obtaining more kilowatt-hours annually must be weighed. Hydraulic losses in general increase as the square of the water velocities, and there is some danger that engineers whose experience has been confined chiefly to waterworks practice will fail to realize the increased quantities and speeds involved in hydro-electric development work, if they do not get the power-plant viewpoint when undertaking such developments.

These and many other considerations bearing directly upon the convenience, safety, reliability and efficiency of operation emphasize the need of expert design in water-power developments of any real magnitude. It is unfortunate that the men who put their money into hydro-electric developments are seldom in a position to appreciate the difference between good and poor engineering. In a steam plant the fuel rate per kilowatt-hour and other running expenses are, to a considerable degree at least, indices of designing ability. In a water-power plant the designer often can "take it out on the river" if things fall far below expectations. The time is coming, however, when hydro-electric station operations will be more accurately compared than has been done in the past. From this time forward it should be more and more appreciated that hydro-electric design is no field for the amateur or faddist to enter.

## How Far Should Organization Work Be Carried?

ORGANIZATION is the keynote of the age, and present-day civilization could not continue without it. Our own industry is a wonderful illustration of what co-operative work can accomplish, but is it not time to define the limits of organization as an effective tool, taking central-station personnel as a case in point? Confining the inquiry to the formation of associations of electrical men in utility ranks, how far down the line is it expedient to encourage regional meetings of employees of different companies, either as branches of national societies or as groups of men trained along particular lines who gather from time to time to exchange views? The industry is thinking about this, at least in some quarters.

Perhaps it is too soon to do more than feel the way along toward conclusions which are adaptable to many situations, but which may not fit all. It seems obvious that real executives, department heads and leading assistants gain almost beyond measure from participation in national and local organizations honestly devoted to service and mutual improvement. So do specialists like power-sales engineers. Through regional organization operating employees classed as chief load dispatchers have become really acquainted as men; they have visited other systems and listened to and discussed

papers of marked educational value. Likewise the benefits of company sections of the National Electric Light Association to the rank and file of employees, men and women, are well established by experience. The point now under consideration, however, is whether corresponding regional organizations of boiler-room foremen, line and underground foremen, storekeepers and chief inspectors are likely to yield correspondingly good results. Opinions differ here, and perhaps no sharp line of demarcation exists between what is clearly worth while and what is doubtful in returns to individual utilities. One thing, however, is vitally important—control of programs within the zone of practical topics.

On some systems foremen of this or that department can rarely be spared to attend outside meetings. Their superiors can get away because construction and repair work go forward at normal speed during their absence. Here is a pretty critical test of prospective success. In some circles it is believed that the good things brought out at meetings and conventions can be brought home and put into use by the superintendents, engineers and other executives who can be spared, without the necessity of drawing upon the "top sergeants" of the industry and slowing down their important and pressing work. On the other hand, if a well-run meeting is attended by subordinates who stick close to business and do not turn the occasion into a base for the exploitation of labor issues, much good may result. Meetings of foremen inside a single company have been known to bring out admirable results in maintenance work, but less experience has been had with such gatherings involving companies under different managements. If there seems to be no categorical answer to the inquiry as to the desirable limit of such organizations at present, it at least serves some purpose to put the question. The crystallization of opinion upon it is much to be desired.

## Large-City Distribution an Increasingly Serious Problem

EVERY large generating station is a source of pride to its owners and operators. None the less, it is rapidly becoming recognized that it is impossible to care for the increased demands for electric service simply by building new stations and pouring their energy into the existing distribution systems. It has become necessary, particularly in the large cities, to rebuild and redesign the distribution systems both to care for the load and to gain greater economies in operation, because little real engineering or executive thought was devoted to a study of distribution practice during the rapid development of electrical service, and in most cases the distribution system that exists today is a hodgepodge of inadequate installations that have developed through the expediencies of the moment.

The enormous increase in the load density and the restrictions placed upon distribution by high costs, congested city streets and industrial and domestic demands for 100-per-cent-perfect service have made it necessary to study this problem with foresight in order to secure a system adequate for present and future needs. It has become necessary to look ahead ten to twenty years in laying out these new distribution systems. Any real study involves the growth in load, its location, the possibilities for overhead lines, the possibilities for underground lines and the possibilities for increasing the voltages. Each of the large cities has a distinctive environment and local load conditions such that no general solution can be applied. But some fundamental similarities exist in regard to general conditions as to type of city, general location of industrial districts and location of power stations with respect to loads, so that the constructive work of some utilities can be applied to the problem in other localities.

Many cities have grown uniformly about a central hub with industrial loads distributed almost uniformly around the periphery. Among these are Pittsburgh, Canton, Detroit and Buffalo. Still other cities have the industrial districts distributed radially along the railroads or watercourses—Cleveland, for example. Typical of the solutions applicable to the first type of city are those applied to the distribution problem in Pittsburgh and Detroit. In Pittsburgh a double-circuit overhead 66,000-volt steel-tower line has recently been installed as a ring about the outskirts. Upon this ring are transformer stations for feeding a unit group of loads. Inside the major ring a second ring of lower voltage is contemplated and secondary tie lines will be used to interconnect the several substations and to afford a two-point supply to each load. Detroit is completing the installation of a 120,000-volt overhead line in the form of a half circle about the city with a power supply from the Trenton Channel and Marysville stations. Transformer stations for radial group feeding will be erected on the transmission line, and secondary tie lines will be used to secure interconnection and a two-point supply to all large loads. In Cleveland, where the industrial districts are radially located, underground and overhead radial feeders with tandem substations will be used. Tie lines will be used to secure interconnection and a two-point supply to the larger loads.

In each of these solutions many vexatious problems are encountered. Using the overhead-ring system, difficulty is encountered in securing a right-of-way at a reasonable cost and, if the city grows, public sentiment may eventually force the removal of the line. Moreover, technical equipment for locating and isolating trouble, controlling voltage regulation, maintaining power-factor adjustments and automatically operating the transformer stations is not yet developed to a sufficient extent. In the radial system similar technical problems are encountered, and among these the high-voltage cable problem is of major importance. Underground systems are expensive and the carrying capacity of the streets is limited. Interconnection of substations is difficult and relays are not yet developed satisfactorily to secure the isolation of trouble under all circumstances. Operating engineers are not yet fully satisfied that oil breakers of ample rupturing capacity have been developed to work on any system with huge power stations behind it, and the development of control apparatus must proceed until it is satisfactorily sensitive.

The technical ability of the engineers in the industry undoubtedly will solve the detail problems and develop adequate equipment. But an organized and co-operative educational campaign is needed to obtain results along other lines which are equally important. The public must be convinced that high-voltage overhead lines are safe and reliable; the public must be educated to see that a steel-tower line, if artistic, can be viewed with pride instead of horror; it must learn that the right of eminent domain is essential if costs are to be reduced, and it must be made to appreciate that good service results from the use of expensive equipment and installations and that these are possible only if the operating company receives a reasonable return on the investment.

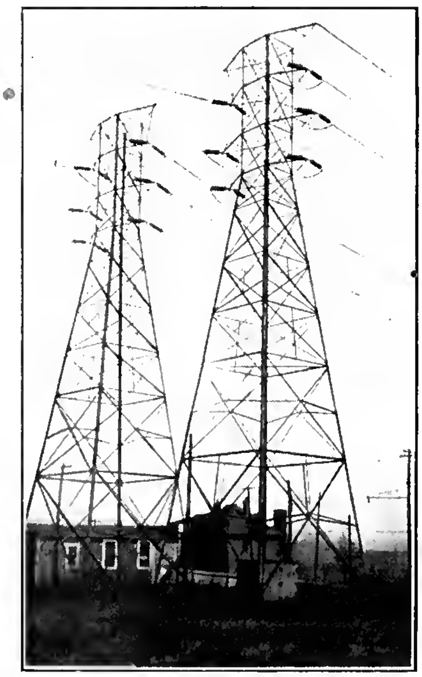
# Construction of the Pittsburgh Ring

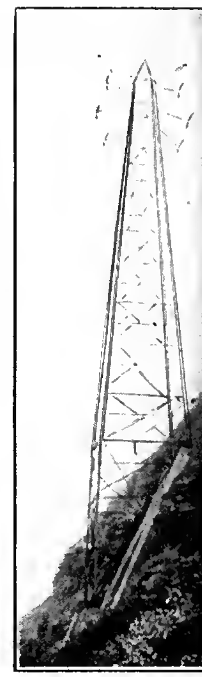
THE Duquesne Light Company has solved its distribution problem by building a 66-kv. overhead transmission line around the city of Pittsburgh. The hilly country, congested industrial districts and the rivers presented very difficult construction problems.

Upper view — A 2,300-ft. span across the Allegheny at Colfax has 600 ft. difference in the elevation of the supports.

Central views—Double-circuit steel towers 60 ft. high are spaced on an average 7.76 per mile. Many towers were located on steep hillsides.

Lower view—Automobiles, horses and men assembled preparatory to a day's work on the line. Power apparatus was used in stringing wire wherever possible.





# Construction, Operation and Repairing on 66,000-Volt System

## How the Duquesne Light Company Employs and Maintains Its 80-Mile Central-Station Bus Surrounding Pittsburgh and Fed from Its Brunot's Island and Colfax Power Houses

By IVAN BUYS
*Chief of Operation Duquesne Light Company, Pittsburgh*

WITHIN a radius of 20 miles of the confluence of the Monongahela and Allegheny Rivers, which form the Ohio, there lies the great industrial district whose heart is Pittsburgh. Power is in demand in large quantities, and the energy supplied by the Duquesne Light Company is playing a large part in making the widely quoted epithet "Smoky City" a misnomer.

The transfer of power from the power houses to the substations which step the voltage down for distribution to customers is accomplished by a 66,000-volt ring entirely surrounding Pittsburgh. Two principal stations, Brunot's Island and Colfax, feed this power ring, which has also been called an 80-mile central-station bus. Each 66,000-volt line can be sectionalized at any ring substation with oil circuit breakers controlled by the relays used for transmission-line protection.

The double-circuit steel towers average 60 ft. in height, although special locations have required the use of 200-ft. towers. The spacing of the towers averages 7.76 per mile; however, the more recently constructed sections tend toward fewer towers per mile and longer spans. The rugged topography of the territory covered has lent itself admirably to long spans with large sags and adequate clearance from ground.

The longest span on the ring is the crossing over the Monongahela River at Duquesne, which is 2,305 ft. The second longest span (2,230 ft.) is the crossing over the Allegheny River at Colfax, with a difference in elevation of supports of 600 ft. A number of other spans are above 1,700 ft.

Very few tangents of an appreciable length were possible because of the many right-of-way difficulties, which proved serious owing to the high value of property in the district. This condition, together with the long spans, has necessitated about 48 per cent of the towers being of dead-end or strain type.

The type of construction known as semi-tension is not used, although a number of combination strain and suspension towers are found. The combination tower is used on small angles. The pull on the inside of the angle gives the wire a tendency away from the tower, and a suspension string of insulators is used. The outside wires are held with strain strings to counteract the pull toward the tower.

### Both Copper and Aluminum Used

The distance of 81.4 miles around the ring is divided into 66.1 miles of No. 4/0 copper line and 15.3 miles of No. 4/0 equivalent steel-reinforced aluminum line. A spur of two-circuit line which feeds the Beaver Valley District through the Junction Park substation is copper. The aluminum wire is on the most recently

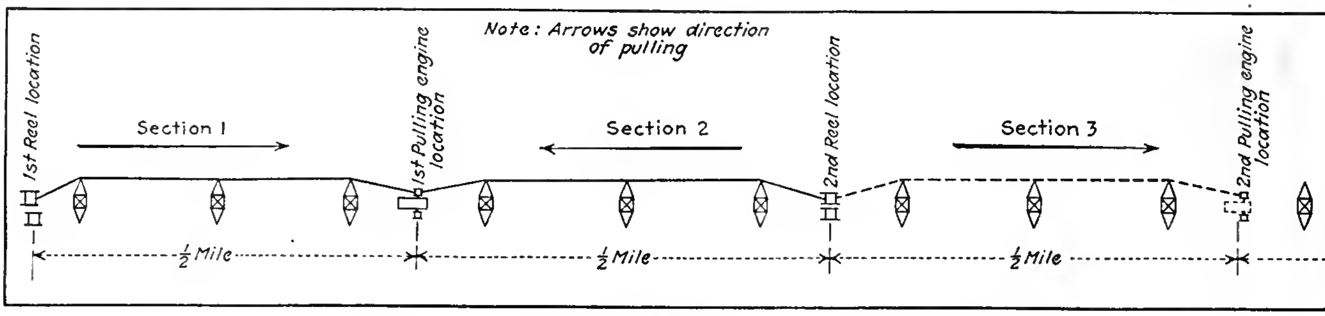
LINE TRUCKS ARE DESIGNED FOR QUICK TROUBLE SHOOTING

built section of the ring, and it has not been in service long enough to allow a comparison of the operating records of the two kinds of wire. The cost of installing the aluminum wire was higher than the copper, and special tools were required for its installation.

Ground wires of $\frac{3}{8}$-in. steel were used around the ring. The greater portion was copper-clad steel, although on the most recently built sections galvanized-steel strand was used. On the older portion of the ring five insulator units were used on suspension strings and six on strain strings. Because of trouble which developed from flashovers during lightning storms six units on suspension and seven on strain were used on the newer portions of the line.

Wide differences of opinion are held by operating engineers on the advantages of arcing horns for the protection of insulator strings. In an effort to obtain some comparable data on a large scale, arcing horns on some sections of the ring were placed on the insulator clamps only. On other sections horns were also placed on the towers to form a discharge gap shunting the insulator units, and on still other sections no horns were used. Operating records are not yet complete enough to allow a judgment of their effectiveness.

The towers were of the rigid type, weighing from 5 tons to 6 tons, and all standard towers were galvanized. A few special towers were painted. Towers at corners and at points of unusual strain, such as river crossings, were bolted to concrete bases. The majority of the towers were anchored to a grillage of steel about 4 ft. square and buried to a depth of about 8 ft.



SEQUENCE OF OPERATIONS IN STRINGING WIRE ON THE SYSTEM

On a considerable portion of the territory served by the Duquesne Light Company coal is found in veins which crop out on the surface or are but a few feet below the surface. On several proposed tower locations the coal rights were purchased to prevent possible weakening of the foundations by the removal of the coal. At one location old mine entries were under the only available tower site and forced the building of foundation piers through the workings.

The average 6-ton tower was erected by a five-man gang in one day. Several towers were built in the record time of seven and one-half hours each. The towers were erected piece by piece, with two men and a foreman on the ground and two men working on the tower.

The only special equipment consisted of a piece of 2½-in. double-strength gas pipe 22 ft. long which was used as a gin pole to raise the corner angles. Later the gin pole was used as a boom on the partly erected tower to aid in hoisting additional steel work.

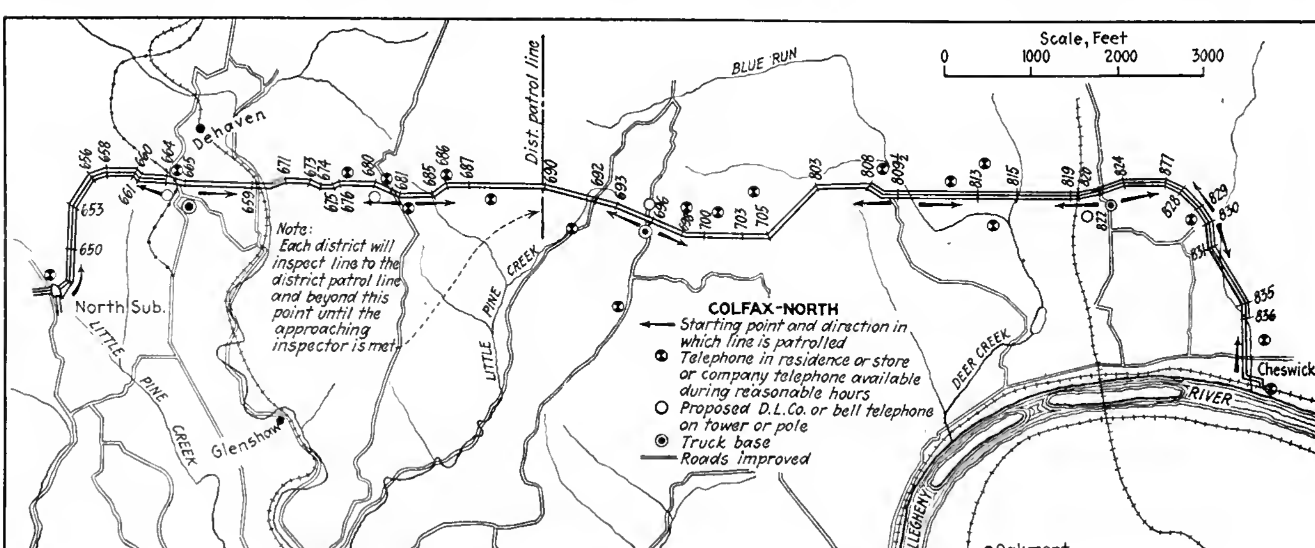
### Stringing of Wire

The many railroads and the excellent highway system in the vicinity of Pittsburgh were of advantage in placing the structural steel, wire and insulators at easily accessible points, but became a liability during the wire-stringing operation. The problem of stringing wire with safety and without interruption to public carriers, other wire lines or the orderly progress of the job required the exercise of much ingenuity. It was found that the best results were obtained by first threading ropes in one-half-mile lengths through snatch blocks on the towers. The wires were then attached to the rope and half-mile sections of wire were pulled in, making the ropes available for the next pull.

The ropes were strung by the aid of a team of horses and in exceptionally difficult places a gasoline tractor of the endless-tread type was used. The tractor also hauled material to points inaccessible to trucks and sagged the wire. The tractor's part in the sagging of wire will be discussed in detail in another part of this article.

A gasoline engine was used for pulling the wire. The engine, which was of 6 hp. capacity, was geared to two "niggerheads" which made pulling speeds of 500 ft. and 200 ft. per minute available. A skid mounting proved sufficiently portable, and the engine played a large part in the speedy stringing of the wires.

All of the motive equipment used in the stringing of the wire is shown grouped with a field headquarters on page 904. The completion of a half mile of two-circuit lines per day, which included the stringing of wire, the hanging of insulators and sagging and securing the wires, was achieved by the construction gang, which averaged thirty men. This record was made possible through the organization of the work. Constant communication by telephone was maintained at all times between the reels of wire, the pulling engine and the sagging gang, which were separated by distances varying from one-half mile to one mile. The telephone communication was established with a telephone twist laid on the ground and terminating in field test sets



MOBILIZATION POINTS FOR HANDLING TROUBLE

and signal bells or horns. The telephone line was installed before placing the pulling engine or wire reels at their locations.

A variation from this method of communication was required on a 30-mile portion of the line. One circuit was installed at the time of erection of the towers, and when about six years later the second circuit was being installed load conditions were such as to require the first circuit to carry load during short periods of emergency. Since, as a safety measure, no wire was strung when this circuit was alive the problem of constant communication between the system operator and the foreman of the construction crew was acute. It was solved by connecting the field-construction telephone circuit to the private lines of the company using the idle 66,000-volt wires as telephone conductors. Temporary connections at the nearest substation from the 66,000-volt wires to the telephone line were established and removed by the substation operator, acting under orders of the system operator.

Elaborate precautions and checking were necessary to insure against the line being energized before the temporary telephone connections were removed, but the results obtained justified the trouble. In one case the line was carrying load thirty minutes after the system operator, through the medium of this hybrid telephone line, ordered the construction foreman to stop work and clear up the line.

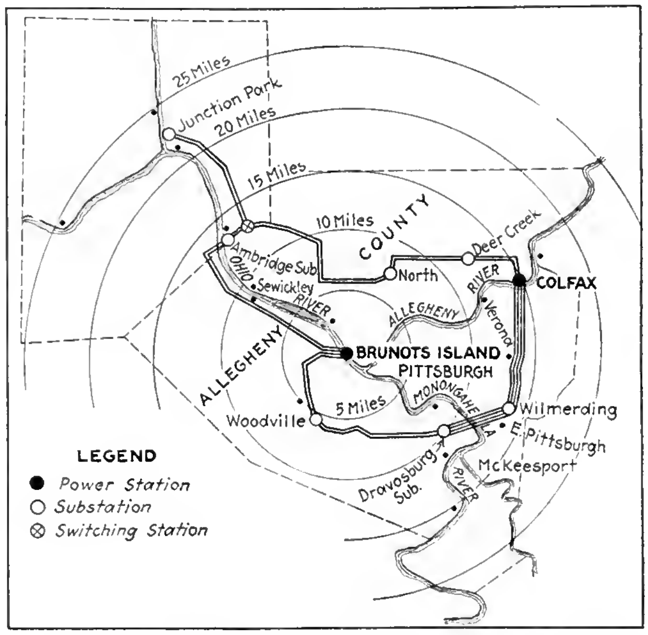
### Gasoline Engine Used to Pull Wire

Often a half-mile section of wire was pulled through the snatch blocks on the towers in eight minutes. This result was obtained by the constant communication maintained between the foreman and men at the reels and the engine. Linemen were stationed on each tower to insure the smooth and uninterrupted movement of the wire, and snagged wires and kinks were seldom encountered. After the wires were pulled through and the gas engine was disconnected, the tractor pulled the wires up to sag position with one operation without the use of intermediate rope blocks.

The time saved in sagging the wire in this manner as compared with using a team of horses and several successive hitches through one or more sets of blocks can readily be appreciated. The sag was determined from charts furnished to the construction foreman, and sag marks were painted on the towers by two men who worked ahead of the construction gang. A telescope clamped to the tower leg verified the sag, which was required to be accurate within 6 in.

A material man, aided as required by men from the stringing gang, hauled all material and tools to the best locations. He preceded the gang and located telephones, temporary storage houses for material and the best routes from point to point on the line. He interviewed property owners and secured permission for the necessary trespass on their property. Representatives of the real-estate department were called upon to settle claims which the material man was unable to satisfy. As the stringing gang moved forward the material man inspected the line, arranged for the collection of all scraps of material or tools left behind and the repairing of any damage to property caused by the gang. The construction foreman, who was relieved of these details, was enabled to devote his entire time to speeding the progress of the work.

Inspectors or patrolmen who walk the entire transmission ring once each week are familiar with the



66,000-VOLT TRANSMISSION SYSTEM OF THE DUQUESNE LIGHT COMPANY FORMS AN 80-MILE RING

standards of operating condition to be maintained. They report things varying in importance from serious landslides, dangerous trees and broken insulators to the replacement of danger signs chipped by stones or rifle fire. Each inspector reports by telephone to the central office at intervals of about two hours during the day. Reports of a serious nature receive immediate attention. Reports which are not considered urgent are mailed by the inspector at the close of each day's work.

A weekly round-table meeting attended by all inspectors serves to keep alive the interest of the men. Competition among them is keen. Charts are prepared which show a comparison of the breakdowns on the

lines for which each inspector is responsible. Breakdowns which are due to the failure of the inspector to see or report hazardous conditions are emphasized by red circles on the chart. The result of a weekly discussion of this chart in open meeting has done much to reduce this kind of preventable failure to one or two per year.

Every effort is made to make the meetings interesting and of value. Each man is encouraged to talk, and in this way the inspection is being constantly improved as the experience of each man is shared by the others.

### Clearing Transmission Line Trouble

Next in importance to keeping tie lines in operation comes the restoring of the lines to service, following breakdowns, in the shortest possible time. Experience has shown that the major portion of the time required to restore the line to service following a 66,000-volt failure is often taken up in locating the fault.

The network of improved highways intersecting the power ring is a great asset in reducing the length of outage. In attempting to improve our records for speed in the restoring of service it was early found that the dispatcher or director in charge could not prepare his plan of attack after the trouble occurred. To remove the necessity for hasty and often ill-advised decisions, maps were developed on which detailed directions concerning the points at which patrolling should start and the location of truck and material bases were designated by symbols. In preparing the maps careful study as to the best roads for access to various points on the line and the location of telephones was made.

A GASOLINE ENGINE WAS USED TO PULL WIRE

Every section of the power ring is covered by such maps and the plan of attack is rigorously followed out. Immediately following notification to the overhead-lines division that a section of line is defective, the director of repair forces knows the exact points to which patrolmen must be dispatched (see arrows on map) and the most advantageous locations to which the repair trucks should be moved so as to be within striking distance of the trouble (see seals on map).

Since these maps have been used, the average outage following 66,000-volt line failures has been greatly reduced. Instructions to patrolmen are so simplified that there is little likelihood of a misunderstanding even by men not familiar with the particular line involved.

The director of repair forces maintains a log sheet on which his orders and the movements of the breakdown locations and repair forces are noted. (See page 907. From the time of failure to the time the line is repaired and returned to service each minute is accounted for. At some later time the log is subject to careful scrutiny to disclose any mistakes in dispatching or loss of time which could have been eliminated. The experience thus gained aids in reducing outages to a minimum. The cause of failure is summarized on the log, which is filed and becomes a permanent record of the breakdown.

Immediately following the dispatch of patrolmen on a faulty line, a number of repair trucks are equipped with emergency material and sent to the truck bases designated on the maps. A number of automobiles or light trucks which are used to distribute the patrolmen to needed points are held near telephones (see stars on map) and are available for transporting the patrolmen to the scene of trouble after it is located. The patrolmen then become repairmen.

Light, speedy trucks which ordinarily are used in light maintenance work or the testing of insulators are in almost hourly communication with the central office. These trucks have bodies designed especially for transmission maintenance and line repair. Following a breakdown, they usually have time to go to the nearest storeroom, load up with material and report at the truck bases before the trouble is located. Spotlights are operated from the storage batteries of the trucks, and portable, electric and carbide lamps are used by patrolmen and repairmen.

Breakdown material for use on lines remote from any storeroom is kept in concrete material houses built under towers at intervals on the line. These houses are about 6 ft. high and 6 ft. square and have steel doors. The contents of the houses are checked over each week by the patrolmen and an effort is made to replace any missing material immediately.

Breakdowns on the ring—i.e., physical damage to the line causing it to be out of service longer than the period required to reclose an oil circuit breaker—have been few. The causes of breakdowns, in the order of their destructiveness, have been lightning, trees or limbs of trees blown down by windstorms, and mechanical failure of insulators. Lightning is responsible for about 52 per cent of the failures, some of which were the result of direct strokes burning off the wires. The immediate cause of other failures was a power arc which followed a lightning spillover on a string of insulators.

Trees were formerly more of a menace than they now are. A systematic and persistent effort during the past two years to remove all trees which if they fell toward the line might cause trouble has brought results. During this period a solicitor has been constantly engaged in obtaining permission for the removal of trees. Experience has demonstrated that a tree-trimming crew consisting of a foreman and six men equipped with the necessary tools and a 2-ton truck can profitably spend all its time removing and trimming trees and clearing brush on the 66,000-volt ring.

The mechanical failure of insulators has been responsible for a few failures. Defective porcelain unable to stand the stresses caused by temperature changes apparently exists in only one lot of insulators. This cause of failure will be eliminated with the replacement of these insulators by others of tried and proved design made of better porcelain.

# Limitations of Carrier-Current Telephony

## Observations Based on Investigations on Duquesne Light Company's System—Duplex Operation Preferred—Spitting of Insulators, Charging of Arresters and Switching Troublesome

By C. A. BODDIE* and M. W. COOKE†

SUCH widespread interest has arisen among central-station men regarding the developments in "wired wireless" or "high-frequency" telephony as applied to high-voltage transmission lines that a brief analysis of this promising application of high-frequency currents from the viewpoint of central-station service seems desirable. In order to arrive at a fair conception of the value of a high-frequency circuit as compared with a physical telephone circuit which parallels a transmission line comparison of the advantages and disadvantages of each type of circuit will be of value.

A telephone circuit strung on the towers of a transmission line, in the absence of a better circuit, is very desirable, but is open to the grave objections that it is hazardous to use and is apt to be rendered inoperative by abnormal conditions in the power line, which is usually the time when it is needed most.

Under favorable operating conditions a fairly quiet telephone circuit is obtained over which clearly understood conversation may be carried on. However, this result is seldom obtained in practice because of the lack of attention to the details of protection, drainage and transpositions. The circuit can be used by line patrolmen from each tower in the line, the patrolman needing only an ordinary lineman's test set to establish communication with headquarters. The cost of construction is low.

Under abnormal operating conditions, on the other hand, the line will be so noisy as to be unusable. Surges in the power circuit will cause the protective devices in the telephone circuit to operate, and if some of these protective devices—particularly drainage coils—are installed outside of the stations, they cannot be switched out of the circuit and reserves switched in when the first set operates.

Failure of a power wire will frequently carry the telephone line down with it, and during high winds the lighter telephone wire may be whipped up into the power wire in the longer spans.

Where restrictions exist as to the ground clearance of the lowest wire on the towers, higher towers must be erected or poles set between the towers to support the telephone wires. It is not often practicable to set poles between the towers to raise the telephone wires, because the power wires may be so low that raising the telephone wires may bring them too close to the power line.

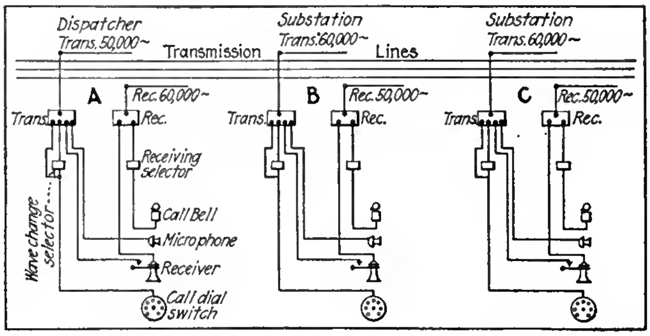
On the other hand, a separate telephone pole line built on the tower right-of-way is reasonably free of hazards so far as patrolmen and station operators are concerned. If the circuit consists of fairly large gage wire and is well insulated, carefully balanced and kept thoroughly trimmed out, it has all the advantages of a line on the towers. If provided with duplicate sets of arrester equipment at the terminals, it can usually be depended upon for service as soon as an abnormal condition in the power circuit is over.

CARRIER-CURRENT EQUIPMENT WAS PLACED IN THE SHANTY BELOW THE LINE, AND WIRES WERE LED TO STATION

The disadvantages of this type of line are that its first cost and maintenance cost are high. The telephone pole line being already on the ground, it is almost invariably used to support 11,000 or 22,000-volt, three-phase lines when new customers must be served along the high-voltage lines. These lower-voltage lines are as a rule provided with single-phase transformer taps which usually cause unbalanced load in the power circuit and destroy the telephone-line balance. Besides, such construction introduces a hazard due to the possibility of the power wires coming down on the telephone circuit.

As compared with either of the foregoing types of physical telephone circuits, the carrier-current circuit can usually be provided at a fraction of the first cost. The maintenance expense will be considerably less than that of a physical circuit on separate poles and probably no greater than a circuit on the towers. Furthermore,

*Radio department, Westinghouse Electric & Manufacturing Company.
†Superintendent of telephones, Duquesne Light Company, Pittsburgh.



METHOD OF CONNECTING STATIONS FOR DUPLEX COMMUNICATION

greater reliability can be expected because the tower line which serves to guide the carrier high-frequency current will remain in service under storm conditions, owing to its rugged construction, when the less rugged telephone line will fail.

Abnormal conditions in the high-tension line will only make the high-frequency circuit noisy during the duration of the disturbance, and even the failure of one or two phases will not render communication impossible, so that at first glance the superimposed circuit seems to fill most of the requirements for communication service over a tower line. However, it seems to the authors that in view of the rapid development now taking place it would at present be advisable to install high-frequency communication apparatus only under favorable conditions.

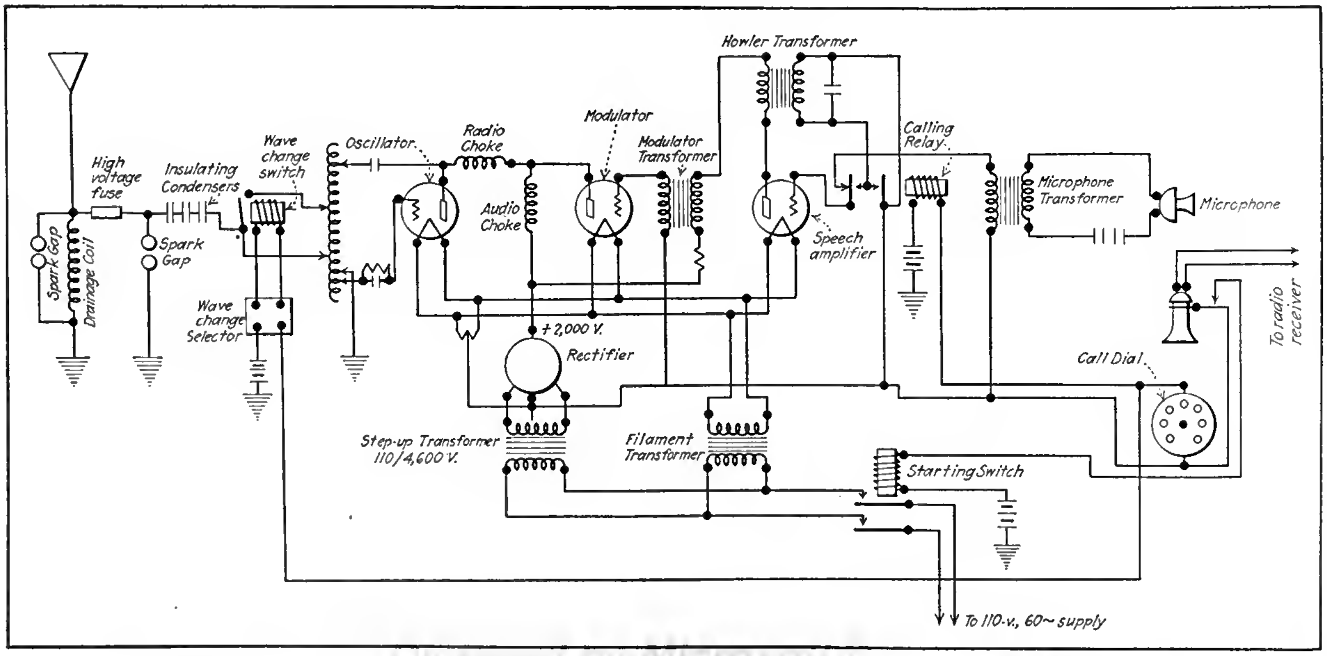
To bring out what the limiting conditions for carrier-current usage are, experiments have been made on the 66,000-volt lines of the Duquesne Light Company for the purpose of determining the feasibility of telephony and remote control of electrical apparatus by means of high-frequency currents superimposed on power lines. These experiments were conducted by the engineers of the Westinghouse Electric & Manufacturing Company, assisted by the communication department of the Duquesne Light Company.

Before the carrier-current experiments were conducted it was popular opinion that a transmission line affords a much more efficient medium for the propagation of high-frequency currents than direct space radio. This impression is probably due to the advertising nature of most of the current literature on the subject. There is also great confusion regarding the name to be applied to this method of communication. Such terms as carrier current, line radio, guided radio, wired wireless and even guided carrier current have been proposed and used. All of the above names are meaningless, and the authors propose to indentify the system by its one distinguishing characteristic, namely, "high frequency." We, therefore, will use the term "high-frequency telephony" in the following discussion to distinguish telephone systems using modulated high-frequency currents from the usual low-frequency telephone which operates on modulated direct current.

High-frequency currents may be introduced into the power line in two ways—either by means of antenna strung parallel to and usually above and below the power wires or by means of condenser-type bushings connected directly to the power wires. The experiments up to the present time indicate that most energy can be put into and taken out of the power line by using antennas.

From preliminary work which had been done on a 22,000-volt line, the Westinghouse engineers estimated that a 50-watt transmitting set would be powerful enough to transmit over the Duquesne Light Company's 66,000-volt line. It was found, however, that much more powerful transmitters were required, and the output was increased to 250 watts.

At the very outset of this work it was recognized that to be successful in load-dispatching service the system must be duplex. That is, it must be possible for a person to talk and listen at the same time as is the case with the usual wire-line telephone. A system which will not permit a person to talk and listen at the same time, but which only permits one person to talk while the party at the other end listens, and then requires both to operate throw-over switches, so that the one who was talking first can hear what the original listener says in reply, will rest under a serious handicap when



HIGH-FREQUENCY TELEPHONE TRANSMITTING AND SIGNALING APPARATUS USED BY DUQUESNE LIGHT COMPANY

compared with a duplex system which permits simultaneous listening and talking.

A further requirement is that the signaling shall be selective. Selective signaling means the ability to ring the bell of a particular station in the same way that the bell of a particular party is rung on a party-line telephone circuit. The necessity for this selective feature will be apparent when it is considered that between the two generating stations feeding into the Pittsburgh power ring there are eight large substations. Unless each one of these stations could be called selectively, the system would not be of practical use, since a signal sent into the line would call all stations when only one might be wanted, and the resulting confusion and delay might result in an improper switching operation being performed by one of the station operators.

The duplex and selective features have been successfully worked out.

One of the things which have been most annoying and for which no successful remedy has been found is the disturbance due to "spitting" insulators. It is generally recognized that an insulator may spit for years without apparently reducing its value as an insulator, and while as a matter of precaution continuous tests are carried on to locate and replace insulators which spit over, it is interesting to note that in large systems there is always more or less of this spitting going on. Conversations cannot be carried on successfully while this spitting is taking place. Furthermore, the spitting very often breaks up the trains of impulses used in selective signaling. This particular difficulty has been the most serious one encountered from the standpoint of talking continuity and reliability of signaling.

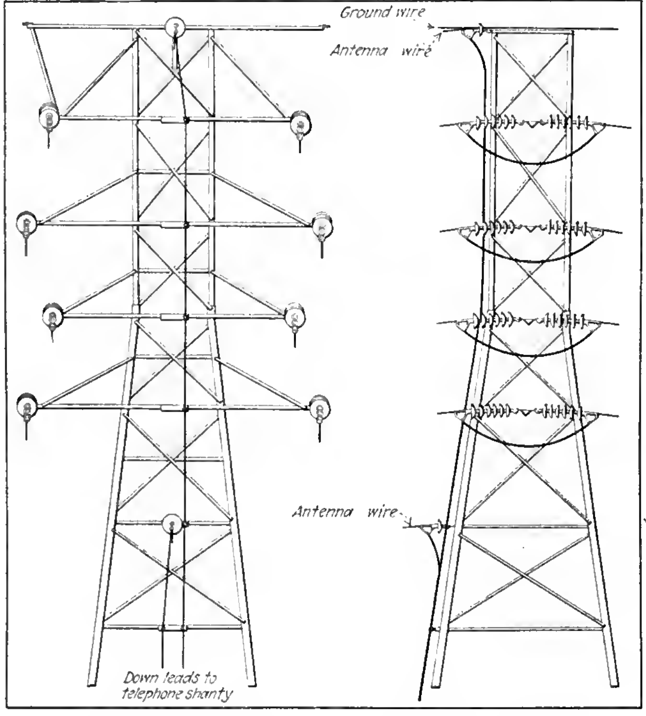
Disturbances introduced into the line through the charging of electrolytic lightning arresters also interfere in the same way that spitting insulators do. In a system in which there is a large number of arresters this is a matter of considerable importance.

### Certain Wave Lengths Best

In the installation between Brunot's Island and Colfax it was learned that the number of wave lengths which can be used satisfactorily is limited. During the progress of the experimental work frequencies ranging from 10,000 cycles to 500,000 cycles were explored with the idea of finding at which frequency the most energy was received at the other end. It was discovered that there are definite wave bands within which good transmission is possible. These bands range between 1,800-2,200, 4,500-7,000 and 14,000-23,000 m. With the apparatus set near the average values of these three bands—i.e., 2,000, 6,000 and 18,000 m.—good transmission is obtained. The surprising thing here is that at wave lengths outside of the bands mentioned virtually all of the energy sent out from one end of the line is absorbed before it arrives at the other end. It is assumed that the inductance and capacity values of the apparatus bridged across the power circuits at the intermediate substations are such that resonant circuits are formed which for all practical purposes are short circuits for those frequencies outside of the three bands named, or introduce impedances which seriously reduce the transmitted currents.

It is evident that owing to the complex system of reactances in a large power system a number of tests must be made to determine what frequencies will go through to a receiving station located at some point distant from the sending station. This is cited to indicate that the equipment cannot be installed with the same confidence that it will be ready to use when the installation is completed as one feels when ordering in an ordinary wire-line telephone.

The effect of switching operations in the tower-line circuits is greater than was anticipated, and it is not possible to predict with confidence the results which will follow the operation of any switch. The Duquesne Light Company tower line carries two 66,000-volt circuits, which until recently were usually in parallel at the two generating stations, but not in parallel at the intermediate substations. A striking illustration of the effect of switching occurred when during a conversation between the two high-frequency stations the amount of received energy at both ends suddenly



METHOD OF ATTACHING COUPLING WIRE TO TOWERS

dropped to about one-tenth of its previous value. In checking up with the system operator to see if any change had occurred in the transmission circuits at the time the change in amount of received energy had been observed, it was learned that the two power circuits had been paralleled at one of the intermediate substations. This substation was about 12 miles from the nearest high-frequency station.

Since the last observations were made, a system of relay protection for the power lines has been installed at each of the substations and generation stations, and the two circuits will ordinarily be paralleled at each of these stations in the future. From the results which were observed before the relays were installed it is to be expected that the high-frequency apparatus will no longer work on the original wave bands.

At most generating and substations it is difficult to string antenna wires on the power structures nearest the stations so that they can be led inside of the buildings, owing to the difficulty of getting them past the outdoor switching and protective apparatus. In practice this means the building of small houses out under the tower line, a span or two away from the main building.

This means that in order to be able to use the high-frequency set from within the station it must be extended by means of a wire-line circuit from the house in which the apparatus is placed to the telephone instrument in the station. A two-wire circuit has been perfected, using an ordinary dial-type automatic telephone, by the operation of which the high-frequency set is automatically started and the proper selective call sent out, substantially as is done in wire-line telephony.

### Nature of System Used

The nature of the communicating system as developed may be seen by a reference to the accompanying straight-line diagram, in which three stations are shown schematically. Each station is provided with two antenna wires, one for transmitting and one for receiving. This simple expedient of providing separate transmitting and receiving antennas is the most important single feature in the achievement of commercially stable and efficient duplex. By it a high capacitative reactance is interposed between the transmitting antenna and the delicate radio receiver, yet nothing is sacrificed in the way of transmitting and receiving efficiency. By the adoption of this means alone satisfactory duplex may be obtained with sets having a radio output of 50 watts or less. For higher powers additional features must be introduced.

As indicated in the diagram, the dispatcher may transmit 50,000 cycles in to the power line while his receiving set is tuned for 60,000 cycles. The various substations must then be set to receive the dispatcher's transmitting frequency of 50,000 cycles and they must transmit 60,000 cycles to the dispatcher. If the load dispatcher wishes to call station "B," the receiver is lifted from its hook. This act starts the dispatcher's transmitter, which sends out a steady high-frequency current of 50,000 cycles over the power line. The selectors at the substations do not respond to this kind of current. The dispatcher now dials the number assigned to substation "B." This operation sends out a series of modulated impulses over the power line; that is, the amplitude of the 50,000-cycle transmitting frequency is made to rise and fall at the rate of, say, 1,000 cycles per second. This modulated wave is rectified by the detector in the receiving sets in exactly the same manner in which the ordinary radio receiver functions. The output of the amplifier is fed into a second detector tube, in the plate circuit of which is a telegraph relay having a suitable high-resistance winding. The plate current of this tube is greatly reduced when a modultated signal is received. The relay closes its contacts each time a modulated impulse is received and hence repeats into the substation selector the impulses sent out by the dispatcher's dial switch. Each substation selector is a device which closes its contacts when it receives the proper number of impulses. Thus while all substation selectors advance during the dispatcher's dialing operation only station "B" selector closes its contacts. This closure picks up and locks in the bell relay. All selectors now return to zero. Station "B" call bell rings continuously until the operator lifts his receiver from its hook. This stops the bell and starts his transmitter, which now sends out 50,000 cycles, which is the frequency which the dispatcher is tuned to receive. Both parties may now talk and listen with the same freedom as in the case of the usual wire-line telephone. At the conclusion both parties hang up and the transmitters automatically shut off.

In the same way, any substation can call the dispatcher. This arrangement requires all communication to go through the dispatcher and does not permit communication between the substations since they are all tuned to transmit 60,000 cycles and all the receivers are set for 50,000 cycles. Hence no substation transmitter can communicate with another substation receiver. Communication between substations may be accomplished by throwing a wave-change switch in the calling substation, which automatically changes the substation transmitter and receiver frequencies to those normally assigned to the dispatcher. Suppose substation "C" wishes to call substation "B." After starting the transmitter by unhooking the receiver the substation operator dials 10. This sends out ten modulated impulses which are received only by the dispatcher's set, but does not ring his call bell because his call number is not 10. Hence nobody is disturbed. The dial switch is, however, directly connected to the wave-change selector which closes the transmitter-wave change switch and locks it in when ten impulses are received. This changes the antenna taps on the transmitter loading inductance and thereby changes the transmitter frequency to 50,000 cycles. Relays in the radio receiver transfer connections to duplicate primary and secondary tuned circuits adjusted to receive 60,000 cycles instead of the previous 50,000 cycles. The substation operator now dials the number assigned to station "B," which rings its call bell. Communication is now possible between "B" and "C," as was the case when "B" was called by the dispatcher. Thus the system as a whole is flexible in that any party on the system may freely communicate with any other party.

The oscillator and modulator tubes of the transmitter are of 250 watts capacity. The method of modulation is that now universally adopted in radio-telephone sets and known as the Heising or constant-current system. The principal feature of this system is the use of a large inductance coil frequently referred to as the audio choke, through which the oscillator modulator plates are supplied in parallel. Voice frequency is impressed on the modulator grid, which thereby varies the modulator plate current. This alternately robs and adds to the current flowing to the oscillator plate, which causes the amplitude of the high-frequency antenna current to rise and fall in accordance with voice frequency. A third tube of smaller capacity, known as a speech amplifier, is interposed between the microphone and the modulator grid, since the voice currents produced by the microphone have not sufficient energy to control directly the grid of a 250-watt tube. The speech-amplifier tube is also used to modulate the transmitter frequency during calls. The impulses from the dial switch act directly on the calling relay, which changes the grid connections of the speech amplifier so as to form a local oscillating circuit whose frequency is something lower than the transmitting frequency, which may be from 1,000 to 10,000 cycles as preferred.

The wave-change switch, as shown schematically, shifts the antenna tap on the antenna inductance coil, thereby changing the transmitter frequency. This is done through the wave-change selector, which acts only when it receives a series of ten consecutive impulses from the dial switch.

The 2,000-volt direct-current plate potential for the transmitter is supplied by a vacuum-tube type rectifier. The alternating-current pulses in the rectified current are completely damped out by a combination of con-

densers and inductances which are built in as part of the rectifier. A rectifier is to be preferred over a motor-generator set for this service because of the liability to failure of a 2,000-volt commutator and also because the 60-cycle alternating pulses in the rectifier are more easily elminated than commutator noises. The elimination of rectifier noises is permanent, whereas the commutator and brushes of a high-voltage direct-current generator require frequent attention.

The selectors used consist of a magnetically driven contact arm which moves over a series of contacts and a group of relays so arranged that unless the pause in the impulses from the dial switch occur on the right contact the arm automatically goes back to its initial position, without closing the bell circuit. This device is merely an adaptation of proved automatic telephone apparatus.

An illustration of what appears to be the proper attitude regarding this new communication development is said to have been taken by the Penn Central Light & Power Company, which is under the management of Day & Zimmermann, Inc. This company has a new power development in an inaccessible section of Pennsylvania. The problem of obtaining adequate communication service has had much study, with the result that the Bell Telephone Company was requested to advise what service should be provided and to quote rates therefor. The Bell company is said to have quoted a high construction cost and annual rental, due to the large amount of line which would have to be built through a rough country. As the private line would have been away from closely patrolled toll lines, its maintenance would have been difficult and repairs slow in case of failure, and the Bell company is said to have frankly advised against its construction and in favor of the installation of high-frequency equipment, for the reason that the high line would be more ruggedly constructed and would probably not fail under conditions which would probably cause the failure of the telephone line. As the result of this advice, the power company is reported to be planning to install five high-frequency sets, four in stations and one for portable use, with the intention of spending about $5,000 a year in the further development of the device.

# Distribution in Export Trade

## An All-Important Feature of the Foreign Policy of the Electrical Manufacturer Is the Organization Through Which His Sales Are Handled and Developed

By P. S. SMITH and W. L. URQUHART*

MANY manufacturers, inexperienced in selling to foreign lands, overlook entirely in considering the possibilities in export trade the fact that distribution is no less a factor in selling overseas than in domestic business. Once the decision is made that a certain product should be introduced to the distant market, there is no detail of preparation more vital than the determination of which will be the best method of distributing the goods to the purchasers. For the very fact that the market is far away and that the goods must be transported into countries and under conditions with which the manufacturer has little familiarity and over which he can have no control makes it all the more important that effective machinery be set up not only to carry forward the shipments themselves but to insure adequate representation for the manufacturer and provide a contact with the foreign buyer, attenuated though it may be.

### Six Plants for Exporting

No manufacturer should fail to fix upon a foreign selling policy. This policy should aim to cover a period of, say, ten years, during which time it will be creating permanent relations which will continue to yield a profitable trade indefinitely in the future. To do this requires some initial expense and much analytical investigation. The results will be a determination of the markets where one's goods cannot be sold and a knowledge of and connection with those where profits are to be had with proper developmental and follow-up procedure.

*Mr. Smith is associate editor of *Ingeniería Internacional* and Mr. Urquhart is export manager for Hart & Hegeman, Hartford, Conn.

The problem is different for each manufacturer as its correct solution rests upon many variables. These include particularly the type of goods involved—whether they are standard, enjoying large demand, or special, with restricted application; whether purely a merchandising or an engineering proposition, and whether there is great competition or not.

The best solution to these problems in a given case can be approximated, if not actually attained, by the selection of the right ways and means at the disposal of manufacturers to enter foreign markets. Different selections will be made for different problems, but they all will be based upon the several methods brought out in this article. For there are in fact six distinct plans under which a distribution system may be set up for export selling.

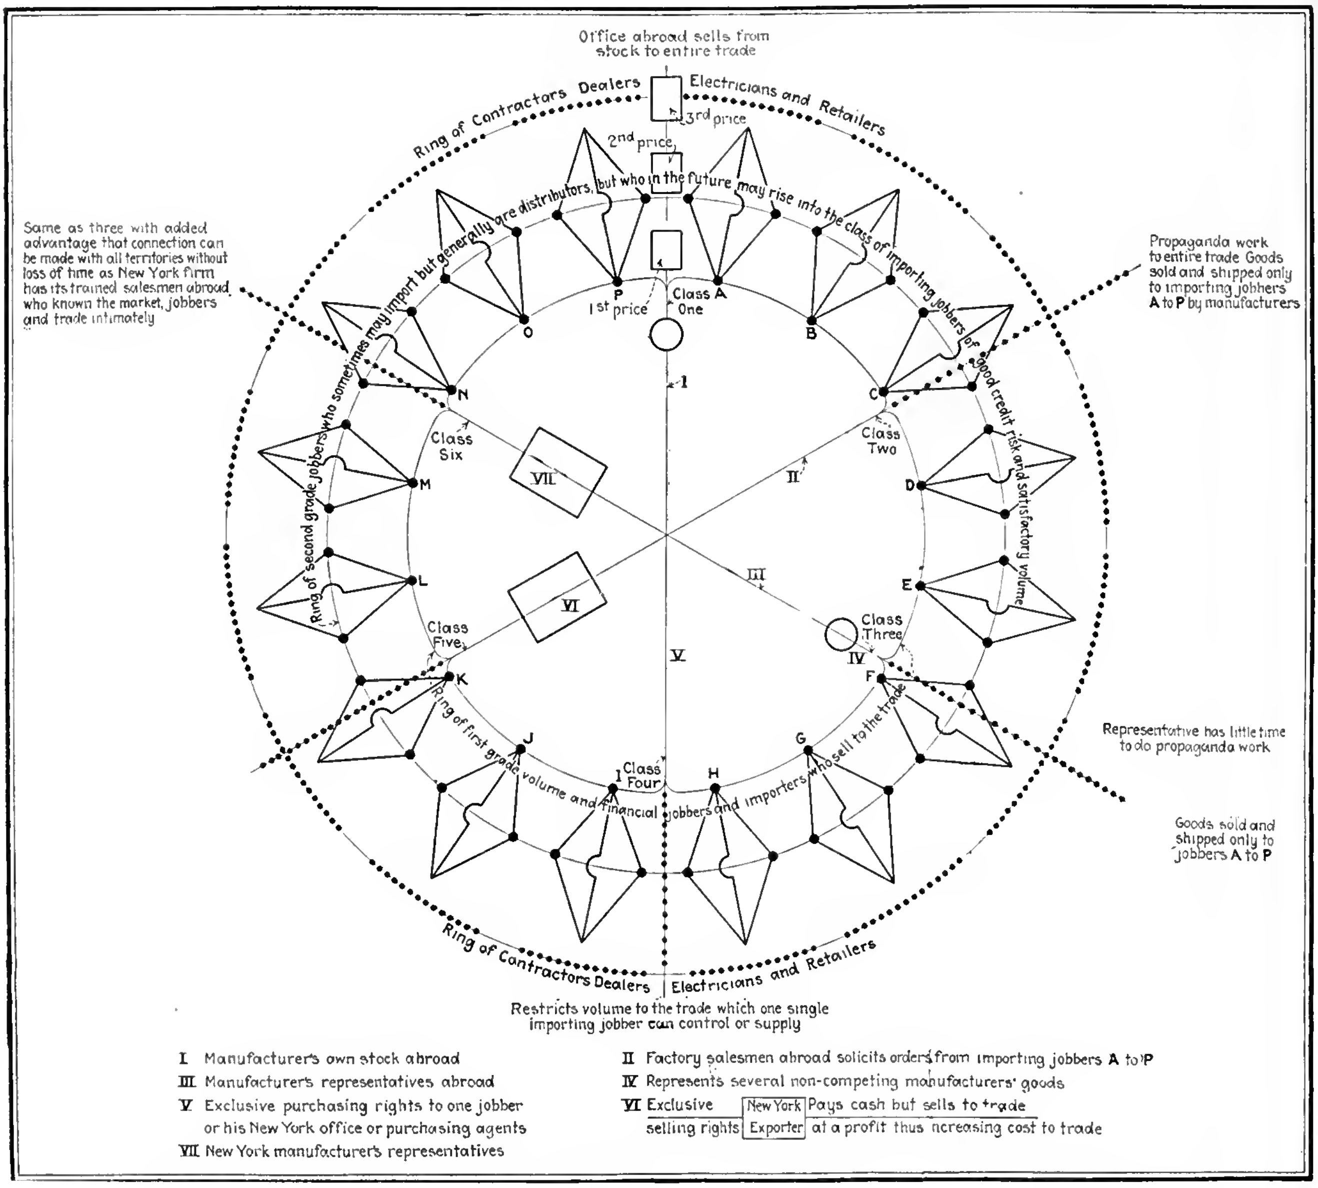
1. *Manufacturers' Branch Offices.*—A few manufacturers will be able to establish their own branches abroad. This usually can be done only in the case of a very large company controlling a complete line of apparatus and small materials so that the volume of combined sales will be large. If managed on correct merchandising principles, this method offers the advantage of controlling a large share of the market directly from the factory. Stocks will be carried locally to supply deficiencies in the shelves of customers while they are waiting for regular orders to come forward from the factory. Some of the tendencies to be guarded against are the erection of a local selling organization with too high an overhead for the volume of sales, the desire of the customer to depend largely upon the company stocks instead of upon his own invested capital, and the selling of goods to the retail or other small dealers who are the legitimate customers of the wholesaler and jobber.

Only if very strong can one afford to ignore the prerogatives of the latter houses.

*2. Own Salesmen Abroad.*—Where it is not possible or desirable to establish a branch office abroad a very satisfactory method may be to maintain one's own salesman in the center of large business possibilities. He would work on a salary or salary and commission basis and solicit orders from the trade to be shipped direct from the factory. He might work the field alone or be connected, at factory expense, with the office of the local exclusive agent. This is done particularly for handling machinery and technical lines requiring an expert to do justice to them. This method is expensive also and can be used only where there are prospects of large sales at a fairly high margin of profit. Under these conditions this is, perhaps, the best of all the systems, as the salesman is an active influence in maintaining the jobber's stocks; and, because he is trained in the line he sells, he can, if he has the incentive of being paid by the results he shows, greatly influence the retailer and even the customer to specify his principal's goods.

*3. Foreign Group Salesmen.*—General manufacturers' representatives, working on commission, handling various lines and soliciting orders to be shipped directly to the jobber, take the place of employee representation very efficiently at times. They are much less expensive than the resident salesman by reason of their expense being divided over a larger number of lines, hence not necessitating so large a commission. Care must be taken, however, to see that such a representative has not taken on too many lines to do justice to each. This and other measures are not always feasible, as the representative is independent of any single manufacturer and apt to be hard to control.

*4. Exclusive Right to Foreigner.*—Exclusive purchasing rights may be given to one selected jobber abroad, provided he is willing to guarantee a minimum annual amount of purchases. When this is done the outlet for at least that quantity of goods is assured, but this is very seldom a satisfactory basis. If the goods are new or unknown, the sales that any one can guarantee are not going to be attractive to a manufacturer thinking in terms of domestic sales. Even under the most favor-



A GRAPHIC PICTURE OF FOREIGN DISTRIBUTION AND THE SIX PLANS WHICH AMERICAN MANUFACTURERS MAY FOLLOW IN SELLING ELECTRICAL PRODUCTS TO THE EXPORT MARKET. RADII "CLASS 1-6" INDICATE METHODS OF APPROACH

able conditions, the jobber must be conservative in his guarantee for his own protection. A note of warning should be sounded, too, that the exporter may assure himself always that the jobber has not taken on the line merely to withhold competition with some other line in that territory.

5. *Exclusive Export Agent.*—In other cases the manufacturer grants exclusive rights to some organization such as the general export merchant, the commission house or the buying branch for a foreign house, all located in New York.

It will be understood that the difference between the export merchant and the commission house is that the export merchant buys in the open market for his own account and sells at a profit by increasing the invoice value, whereas the New York commission house, properly speaking, receives a commission from the importer abroad for purchasing material required.

The two principal defects with this plan are, first, that the manufacturer has no control over his ultimate market and so does not know who his customers really are nor whether he is getting his full share of the business, and, second, that these commercial units are very seldom in position to do any real constructive selling or propaganda. Their chief function is to buy upon receipt of an order from a foreign client, usually without stipulation as to maker. When they accept agencies it is also well to be assured that they have the proper personnel to handle a line of electrical goods and to push it actively on behalf of the manufacturer. The greatest advantage from dealing with them is that they generally pay cash in New York, thus eliminating from the transaction all question of credit or collection.

6. *Manufacturers' Export Group.*—There has been reserved until last the method which seems to have the best chances for success, especially for a group of manufacturers of wiring devices and other allied material. This method, which may be called the combination export department, consists of the exclusive rights given by manufacturers to a New York manufacturers' representative having jobbers or salesmen abroad soliciting trade from the wholesale importer-dealers. Just why this offers an exceptional opportunity—that is, the maximum of profit—for those to whom the direct personal representative in the field is not feasible will be shown.

Each manufacturer in considering these possible plans for distribution can decide for himself by the process of elimination just which ones are not applicable to him.

Distribution methods in foreign trade are not necessarily alike for different foreign markets, but in every

A SIDELIGHT ON DISTRIBUTION IN MEXICO—DRAGGING A TRANSFORMER THROUGH THE MOUNTAINS

case it should be the endeavor of the manufacturer to bring them as closely under his control as possible. This may be illustrated by citing the case of the several countries of the Orient which together now absorb approximately 20 per cent of our electrical exports. The general practice in past years seems to have been to sell almost exclusively through middlemen as indicated by method No. 4 instead of building up direct contacts. As a consequence, few manufacturers know the exact way in which their business is being or should be developed within those countries. Method No. 6 then might be the ideal arrangement under these circumstances.

But what is desired by the individual manufacturer

A LOCAL DISTRIBUTOR'S DELIVERY EQUIPMENT IN OSAKA, LOADED WITH AMERICAN ELECTRICAL GOODS

A DEALER'S STORE IN NEW ZEALAND AND HIS CART CARRYING AMERICAN METERS

perhaps more than anything else is the employment of men who know the specific requirements in each different country as it applies to his own line. Obviously there are a number of men in the electrical industry who have specific knowledge of this kind, and for this reason plan No. 6 will appeal as being the most attractive of all the other methods to the average manufacturer, and especially to the manufacturer who has not yet built up a large export organization.

### Electrical Export Lines

There are approximately fifteen hundred manufacturers in the United States producing electrical material, to most of whom this article on distribution applies. The main groupings are as follows:

Motor appliances.
Heating appliances.
Fans.
Interior-wiring devices.
Wire.
Small motors and motors up to 10 hp.
Insulated materials and devices, including tapes, etc.
Lamps.
Batteries, dry and wet.
Conduit and conduit fittings.
Pole-line material.
Motors.
Instruments.
Lighting fixtures and glassware.
Wireless supplies.
Bells and annunciators.
Radio-telephone sets and parts.
Special material.

Many, if not the majority, of these fifteen hundred manufacturers do sell to some extent for direct shipment abroad, but most of them have no definite knowledge as to the standing of the importer in the foreign territory, of his trade standing, of the way he distributes or the possibilities for extending his business by careful sales work.

### Methods Differ with Country

Sales methods, in spite of claims to the contrary, do vary considerably, depending upon the country. For instance, in the Argentine all the materials in these classifications could be sold direct to some fifteen or twenty merchants who are thoroughly dependable as regards credit and sales organization. However, there might be only five firms in Belgium, New Zealand or India; three in Egypt, or in the case of territories such as China and the Dutch East Indies, Norway or Italy, satisfactory direct distribution could be obtained only through one single firm. A question now arises immediately in the minds of the majority of these fifteen hundred manufacturers as to how they can learn the names and obtain the co-operation of these chosen firms through the world.

The answer should be and is a simple one, for it consists in the carrying out of the basic principles as outlined in the combination export department method. It is to be remembered, first of all, that all the materials in the column above are, properly speaking, jobbers' supplies, and it is obvious that the importing jobber who distributes to the smaller jobber, to the inland small-town contractors, dealers and hardware shops is the one to be looked to. And it is these importing jobbers in whose hands lies the future of the foreign sales of electrical material.

Returning now to the combination export department method already outlined as Method No. 6, manufacturers who do not yet possess direct contact with the class of importing jobber in the foreign country must obtain that contract if their sales are going to be a prominent and dependable factor. The object in mind should therefore be to build up an organization in each country, sometimes having that organization possess sub-agencies, as in the case perhaps of France, Chile and India, where there are more than one importing and distributing center.

As already mentioned, the entire electrical line which could be sold to jobbers can be classified under not more than twenty main sections, so that it would be easily feasible for twenty manufacturers to group together and form a centralized export department which would be composed of men thoroughly confident of the possibilities of export trade in the first place, and, secondly, well versed in the requirements of the majority, if not all, of the countries where market waits, and, thirdly, knowing by name and frequently from personal visits to foreign countries the character, caliber and trade standing of the main importing jobbers in each country. This centralized export department would most profitably be handled on a commission and fixed-contribution basis, receiving its remuneration by a commission on the sales made after they were fully paid for by the client, with a stipulated monthly allowance by each manufacturer paid for maintenance, through the first year at least, while the developmental work was being carried out.

### Organization of Group

The organization would employ trained electrical salesmen as manufacturers' representatives abroad, who would solicit business and take orders from the first-class importing jobbers and send these orders to the group export department in New York, which would distribute them to the various manufacturers concerned. The manufacturers would support the export department by supplying literature, sales information and manufacturing information, all of which would be passed on by the group export department to every country in the world where such manufacturers' products could be sold. The group export department would therefore be a true export sales department by informing customers throughout the world of salable material produced by each manufacturer it represented and referring the client to the resident salesmen for up-to-date information, terms of sales and delivery dates.

One of the main features of this organization would be that each manufacturer would retain his individuality as regards his product and the use by the export organization of the letterhead of the manufacturer whose products were being pushed in each foreign country; also, the control of the manufacturer's products would always remain in the manufacturer's hands. Drafts would be made out in his name, forwarded for collection and sent back to the manufacturer direct in his name. At all times the manufacturer could refuse to accept any specific order from any certain customer should he consider that the credit information supplied by the export department would not warrant the acceptance of such an order.

### How Group Agency Functions

Regarding the matter of financing, in the event that the credit information sent to the manufacturer was sufficient to obtain approval of the acceptance of a specific order, the manufacturer would make up the shipment in accordance with the specifications supplied by the export department and ship the goods to New York accompanied by the necessary documents—draft

on customer, export declaration, invoice and a bill of lading—and the export department would then take these documents and attach thereto the other necessary papers, such as ocean bill of lading and insurance certificate and would, in fact, attend to the dispatch of the shipment and add to the draft the expenses incurred for freight, insurance, cartage and so forth in accordance with the manufacturer's own terms of sale. The export department would in turn obtain reimbursement for the exact cost of clearing the shipment from New York, present the draft and attached documents to the bank for collection in the name of the manufacturer, and the bank would obtain payment from the customer and remit direct to the manufacturer.

Other points in favor of the group export department are the facts that, except in the preliminary or analytical stage, the cost of maintenance would be fixed by a commission depending solely upon the volume of foreign sales made; the information regarding clients would be complete; the information regarding possibilities of sale in each country would be complete as that organization's resident abroad would depend for his livelihood upon the group export department; instructions given by the department would be much more carefully attended to and carried out; each manufacturer would maintain his individuality from beginning to end of every transaction; skilled salesmen could be employed abroad who are fundamentally electrical men and who would not have to spend part of their time in visiting hardware importers and selling sanitary goods, foodstuffs and other imports as so many so-called manufacturer's representatives abroad do. By reason of the salesman in the foreign country representing as many as twenty different manufacturers, there would be sufficient income from the commissions to make it worth his while to do a thorough job not only by selling to the importing jobber but by helping that jobber sell the products, through bringing the new devices for which America is rightly famous to the attention of the local architects, builders, contractors and so forth.

# Hartford's Combination Residence Rate

## How It Was Introduced for Trial Period and Why—Four Objectives Sought—Results of a Year's Operation—Fewer Than Two-tenths of 1 per Cent of Residence Customers Desired Return of Old Rate

EXCLUDING cooking and refrigeration, the requirements of household appliance service are estimated at Hartford, Conn., as potentially from 30 kw.-hr. to 40 kw.-hr. per month per residence, with perhaps 20 kw.-hr. additional for lighting. The latter is low compared with the lavish use of illumination that customers would like to make under a more favorable rate than 10 cents per kilowatt-hour. Under the ordinary lighting rate this business simply does not come, and the resistance to the free use of appliances resulting from this straight meter rate is a stiff obstacle to the domestic utilization of electricity. In Hartford, as elsewhere, inducements were offered in the way of special rates to get appliances used. Failure resulted. Customers having power circuits got a 3-cent or a 4-cent rate and used the service liberally, but these were a mere bagatelle compared to the total number of customers. After fifteen years' effort a grand total of 500 out of 35,000 customers in Hartford had been persuaded to install special wiring. The proportion was too small to be justified.

### APPLIANCES "UNSOLD" ON LIGHTING RATE

From the Hartford company's standpoint, an appliance sold to operate on a lighting rate is not a "sold" appliance, at least for the rank and file of the customers. In order really to "sell" a flatiron, as Vice-President Samuel Ferguson put it before the New England Division, N. E. L. A., at a recent meeting in Worcester, the salesman must sell about $50 worth of wiring to insure its full use on a power circuit. In Hartford this means that a million and a half dollars' worth of wiring would have to be sold to customers before the full use of residential appliances could be insured. Such a task was seen to be too large a handicap, and the way out was via the two-part rate, the working out of which required an exhaustive study of all available rates of a residential character.

The rate in effect prior to the inauguration of the combination rate was a straight-line meter rate of 10 cents per kilowatt-hour. The new rate reduced the energy costs to the consumer, but included a flat charge of 5 cents per month for each 100 sq.ft. of floor area, outside measurements. In computing floor area the outside dimensions of the building multiplied by the number of floors were taken, less an allowance for walls, etc., of 4 per cent per 1,000 sq.ft. of over-all area up to 10,000 sq.ft., with a minimum allowance of 10 per cent. Bay windows, unfinished attics, cellars and porches, as well as incidental barns, garages and other outlying buildings unfitted for living quarters, were not included in the computations of floor area. A uniform energy rate of 6 cents per kilowatt-hour by meter is charged for all electricity used.

The new rate went into effect in January, 1922. Ten days before the new rate was announced to the public the directors of the company passed a rate which was published in the local press without announcing the details. The vote in substance said that the management was to file a new rate which would do the following four things:

1. Cause a reduction of approximately $100,000 in the yearly total of residential bills as a class; i.e., reduce the revenues from residential service approximately 10 per cent.

2. Distribute that reduction in proportion to the use made of the facilities required to furnish the service. This meant that a man with a bad load factor would get no reduction, while one with a good load factor would get the full benefit. The "facilities required to furnish the service" did not mean the meter. The company maintained that the meter charge is included in the energy component, but that its fixed charge is the interest and so forth on the station and lines to serve the house.

3. Make the distribution of reduction to residence

consumers without distinction between large and small customers; i.e., a small customer with a good load factor should get a reduction, a large customer with a bad load factor should not. No advantage was planned for the large customer because he was a large customer.

4. Provide a means whereby an average customer could obtain 30 per cent more electricity at an increased bill not to exceed 10 per cent.

The new rate was announced in December, 1921, in a display advertisement (Fig. 1). Here all the facts were laid upon the table and the various steps by which other rate schemes had been eliminated were set forth and the consumers shown exactly what the new rate meant to them. Most important of all, the consumer was shown that for relatively large uses of energy he would receive a material reduction in cost, but that for abnormally small use, either in individual months or continuously, the rate would be higher than the old one. The fact that the consumer has it in his power to "make his own rate" was stressed and illustrated by an example.

The new rate was not a service charge, but was an area charge, the area being a measure of the demand. One objection to a service charge was taken away by the fact that for a small customer it was based on a small house, for a large customer on a large house. The new 6-cent energy rate in place of 10 cents appealed to the public from the outset. For an ordinary lighting customer the area charge combined with the energy used for lighting made the company whole on a 9-cent lighting rate; that is, gave the same income as a 9-cent rate. Beyond an average use of lighting, the rate was 6 cents. This put a power rate into every room of the homes of 35,000 customers. The lighting bill was taken care of by the sum of the area charge plus the energy at 6 cents, and the additional use for appliances or extra light was taken care of by the 6-cent energy charge.

Announcements were also made that the company purposed to try the new rate for a year, but if at the end of that time it should for any reason prove unpopular and the customers desired a change, a return

# OUR RATE REVISION

**Our Revised Residential Lighting Rate, Effective January 1, 1922, is Announced as Follows**

## Combination Flat Rate and Meter

(1) FLAT RATE, 5 cents per month for each 100 square feet of floor area, outside measurements, with due allowance for walls, closets, etc.,

plus (2) 6 cents for each unit of electricity used by meter. Lamp renewals as at present.

THE FOLLOWING LETTER IS REPRINTED FROM TUESDAY'S "COURANT"

THE HARTFORD ELECTRIC LIGHT CO.
HARTFORD, CONN.

Dec. 20, 1921.

To the Hartford Courant,
Hartford, Connecticut.

Gentlemen:-

In to-day's issue of your paper is contained the announcement of our new combination rate for electric current for domestic use, superseding the existing 10¢ rate.

This rate is designed to make possible a more liberal use of our service, and to change uses which are now luxuries, on account of the 10¢ rate, into inexpensive necessities at a 6¢ rate.

The change involves a decrease in our revenue of approximately $100,000, and it is only our confidence that the new rate will correspondingly stimulate our sales, that justifies this reduction, as prices of coal and labor have not yet fallen sufficiently to materially affect our costs.

The new rate is fair to all, and will reduce the bills of all customers in the months where an average use or more is made of the facilities which we furnish. There will, of course, be an increase of rate in any case or in any month where the use made of our facilities is abnormally low, as in some cases would occur in the summer.

While we believe that the new rate is fair, logical and for the best interest of all, we realize that it is new in Hartford, and if for that reason it proves to be unpopular, it is valueless, as "good will" is our most valuable asset. We, therefore, make the following specific agreement, namely:-

"If after one year's fair trial of this Combination Rate, it should for any reason prove unpopular, and our customers desire us to change, we will return, either to the present 10¢ rate, or if conditions warrant, to such lower rate than 10¢ as our costs at that time justify."

We do not believe such change will be desired, but wish to assure our customers that in the future as in the past, we will endeavor to conduct our business as far as possible in conformity with their wishes.

Yours very truly,

THE HARTFORD ELECTRIC LIGHT COMPANY.

S. Ferguson Vice-President.

The above rate is in accordance with the vote of our Directors passed November 22, 1921, which stated that the revision must do all of the following things:

(1) Cause a reduction of approximately $100,000 in the total of house lighting bills as a class, based on the last 12 months' use.

(2) Distribute that reduction in proportion to the use made of the facilities required to furnish service.

(3) Make that distribution to residence customers without distinction between large and small customers.

(4) Provide a means whereby an average customer may obtain 30% more current at an increased cost of not more than 10% above his present bills.

Other Rates Which Were Considered and Rejected

9 CENTS FOR EACH KILOWATT HOUR

CUSTOMER CHARGE OF 50 CENTS, PLUS

BLOCK METER RATE

A

For the interest of those of our customers who wish to know why this rate was selected, we print herewith several rates used elsewhere which we have been figuring on. All of these would make the initial reduction desired in point (1) above, but each of them fails to meet one or more of the other requirements, or has some undesirable feature.

THE RATE WE HAVE SELECTED AS ANNOUNCED ABOVE IS A COMBINATION OF THE POPULAR HARTFORD FLAT-RATE, SLIGHTLY MODIFIED, WITH A LOWER METER RATE THAN WE HAVE EVER HAD.

Other Rates Which Were Considered and Rejected

COMBINATION FLAT RATE BASED ON SOCKETS, AND METER

COMBINATION FLAT RATE BASED ON ROOMS, AND METER

COMBINATION CUSTOMER CHARGE, FLAT RATE AND METER

B

### Effect of the New Rate

The effect of the rate on each customer depends upon his use of the facilities required to furnish service. If his use, for the size of his home, is larger than average then his reduction will be correspondingly greater. If his use, for the size of his home, is less than average, then his reduction will be correspondingly less. In a small number of cases, or in some months, if the use, for the size of the house, is abnormally small, then the rate will increase. In this way each customer makes his rate by his use.

The way the rate works out in the case of the average customer is shown in the example printed herewith.

THE AVERAGE CUSTOMER

C

**The Low 6-Cent Rate Makes Possible, for Large and Small Customers the Liberal Use of Our Service, for Better Lighting and for the Many Electric Labor-Saving Devices. The Cost of Operating Any Lamp or Appliance is Reduced 40%, or Nearly One-Half.**

**Increased Use of Our Service Will Make Possible Future Decreases in Rate Which Will Be Made as Soon as the Sales of Electricity Grow Sufficiently to Permit.**

## The Hartford Electric Light Company

266 PEARL STREET CHARTER 3330

### A Other Rates Which Were Considered and Rejected

**9 Cents for Each Kilowatt Hour**

This is a reduction of 1 cent per kilowatt hour from the present 10 cent rate. This meets point 1, but does not cover 2, 3 or 4, as this type of rate does not take any consideration of the use of the facilities required to furnish service; it is not low enough to meet point 4.

**Customer Charge of 50 Cents Plus**

7 cents for each unit of electricity. This meets point 1, but fails on points 2 and 3, as it is not based on the use of facilities required to furnish service; it is not low enough to meet point 4; also we do not believe a flat charge per customer, regardless of size, to be as fair.

**Block Meter Rate**

10 cents for first 15 kilowatt hours; 7 cents for excess. This meets point 1, but fails on points 2 and 3 as it is not based on the proportionate use made of the facilities required to furnish service; it is not low enough to meet point 4.

### B Other Rates Which Were Considered and Rejected

**Combination Flat Rate Based on Sockets and Meter**

Flat rate of 3.5 cents per socket, plus 6 cents for each kilowatt hour. This meets all the points, but causes annoyance to the customers on account of the frequent inspection trips to count the sockets, it is impractical with 40,000 customers.

**Combination Flat Rate Based on Rooms and Meter**

Flat rate of 20 cents for each room, plus 6 cents for each kilowatt hour. This meets all the points, but causes annoyance due to the necessity of our men going frequently through all the house; It is also somewhat unfair in charging the same for a small room as for a large room.

**Combination Customer Charge, Flat Rate and Meter**

A customer charge of 50 cents, plus a flat rate of 4 cents for each 100 square feet, plus 5 cents for each kilowatt hour. This meets all the points. It is in use elsewhere in Connecticut. It results in a lower energy rate than the one we have adopted. But we have been led to believe that our customers did not care for a uniform customer charge, and so have eliminated that element from our new rate.

### C The Average Customer

| | | |
|---|---|---|
| The present average customer uses 23 units a month, amounting on the old rate to... | | $2.30 |
| On the new rate, his bill would be: | | |
| (1) Flat rate, average area 1,400 square feet at 5 cents a hundred.......... | $ .70 | |
| (2) 23 units at 6 cents.............. | 1.38 | 2.08 |
| Saving | | .22 |

He can take this saving, or if he wishes he can use electricity more freely at lower cost. Assume that he uses 30% more, then his bill would be:

| | | |
|---|---|---|
| (1) Flat rate as above .................. | $ .70 | |
| (2) 30 units at 6 cents ............. | 1.80 | $2.50 |

**Note that if he had used this increased amount on the old rate, it would have cost $3.00, instead of $2.50.**

FIG. 1—FULL-PAGE ADVERTISEMENT ANNOUNCING NEW TWO-PART RATE IN HARTFORD AND SHOWING DETAILS OF RATE AND HOW IT AFFECTS DIFFERENT CUSTOMERS

THE HARTFORD ELECTRIC LIGHT CO.
266 PEARL STREET
HARTFORD, CONN.

ADDRESS YOUR REPLY TO THE COMPANY

IN YOUR REPLY REFER TO

January 10, 1923.

To Our Residence Lighting Customers:

A year ago we revised our residence rate from the previous 10¢ rate to a 6¢ energy rate plus a fixed charge based on area of customer's residence, a method of charge which was entirely new to most of our customers. From results elsewhere we were sure that it would prove advantageous to this community. We estimated that it would mean a reduction of approximately $100,000 from the old rate, and at the same time more electricity for less money. We asked our customers to give the new method a fair trial for one year. We also agreed that if after a year's trial the new method should prove unpopular we would abandon it.

The trial year has now passed and we thank you all for the fair tryout you have given the rate. We believe that the majority of you are pleased with the results because of the following facts, among others:

1. There are now only about one-quarter as many complaints on bills as there were with the old rate.

2. The public has paid $94,724 less for the total of its household electric bills in 1922 than it would have paid if billed under the old rate.

3. The reduction in cost of current at 6¢, as compared with 10¢, makes possible the use of labor-saving appliances in the home to an extent not otherwise possible or economical.

It is possible, however, that we have misjudged public sentiment. Therefore, as promised, we are giving our customers an opportunity to register their disapproval by the use of the attached coupon, which the Mayor has kindly permitted us to address to his office, in order that the count of same may be made by a third party.

Yours very truly,

THE HARTFORD ELECTRIC LIGHT COMPANY,

S. Ferguson
Vice-President

## *Instructions on Filling Out Coupon*

1. Coupon must be signed by the customer. See that the signature is the same as the name appearing on the face of your last bill.
2. Fill out the blank space on the coupon with the cost per day as obtained by dividing the area charge appearing on your bill by 30 days. This requirement is essential for two reasons:
   a. That you may surely know how small an amount you are paying in return for the benefit of a rate reduction from 10c. to 6c.
   b. That the genuineness of the signature may be checked, as this information is known only to the customer and to the Company.
3. Any other reasons, comments or criticisms which you think should be brought to the Company's attention may be written on a blank piece of paper and attached to the coupon. Constructive suggestions are always welcome.
4. After filling out and signing the coupon, same should be mailed to the Mayor not later than January 13, 1923.

Hon. Richard J. Kinsella,
Mayor of Hartford,
Municipal Building,
Hartford, Conn.

Dear Sir—

In order to obtain the reduced price of 6c. for electric current instead of the old 10c. price, I have to pay the Electric Light Company a flat charge of .... cents per DAY, and I understand that all others are billed a similar charge, varying in amount in accordance with the size of the house.

Because of my relatively small use of current in proportion to the size of my house, this flat rate overbalances the reduction in the cost of the current. My family and I do not see the need of enough additional electricity in our home for labor-saving appliances or for lighting at the 6c. price to make the new rate advantageous to me. Please record me as preferring the 10c. rate.

Yours truly,

..............................

FIG. 3—ADVERTISEMENT OF METHOD AND COUPON FOR REQUESTING FORMER RATE

City of Hartford.
CONNECTICUT.
OFFICE OF THE MAYOR.

RICHARD J. KINSELLA,
MAYOR

ABRAHAM S. BORDEN,
SECRETARY

January 15, 1923.

The Hartford Electric Light Company,

Hartford, Conn.

Gentlemen:--

With reference to your advertisements which have appeared in the local newspapers January 10th to 12th, inclusive, regarding your 6 cent residence lighting rate, this office has received a total of 67 coupons expressing preference for the old form of rate. We understand from certificate of Messrs. Brash & Blanchard, Certified Public Accountants, that you have a total of 34,599 customers on this residence lighting rate. Therefore, the coupons received showing a preference for the old rate amount to 2/10 of 1 % of the total customers concerned.

Very truly yours,

Richard J. Kinsella
MAYOR

We are pleased that the above letter from His Honor, the Mayor confirms our opinion that the great majority of our customers are satisfied that our new 6c. rate is now operating or will soon operate to their advantage, as we promised it would, and therefore it will be continued.

We have thereby succeeded in making a low power rate available in every room of each of our 34,000 customers' homes without an expenditure on their part of at least $50 each for the installation of a separate power circuit.

We are not, however, content that there should be even as many as 2-10 of 1% of our customers who are not pleased, as we aim to give 100% satisfactory service. We have, therefore, filed with The Public Utilities Commission two (2) options to our 6c. residential rate, as follows:

1—For any use:
**10c.** per k. w. hr.—No area charge.
Minimum bill **$1.00** per month.

2—For cooking (including light and other household uses):
2c. per k. w. hr.—Area charge 12c. per 100 sq. ft.
Range charge—50c. per k. w. installed.

With these three household lighting rates of **10c, 6c,** and **2c.** for our customers to choose between, every one can be satisfied, and we can accomplish our aim, which is to render good service to the public with 100% of good-will on both sides.

**THE HARTFORD ELECTRIC LIGHT COMPANY**
266 Pearl St. 2-0131

FIG. 4—ADVERTISEMENT OF RESULTS OF REQUESTS FOR FORMER RATE AND ANNOUNCEMENT OF TWO ALTERNATE RATES

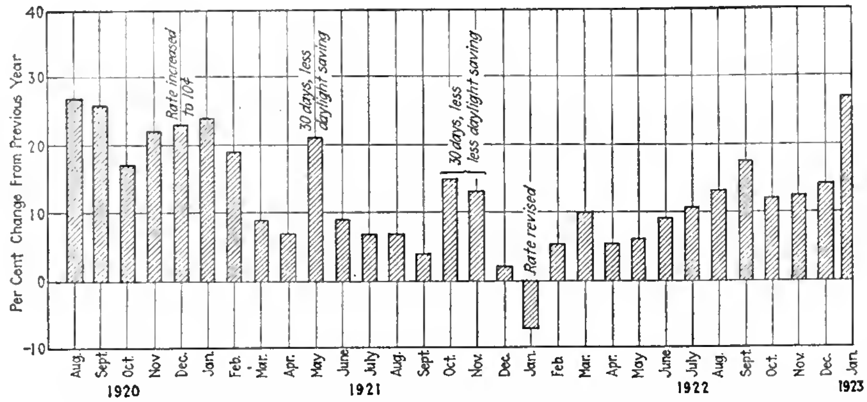

FIG. 5—PERCENTAGE INCREASE OR DECREASE OF RESIDENTIAL KILOWATT-HOURS CONSUMPTION OVER CORRESPONDING MONTH OF PREVIOUS YEAR

year. In these instances the increased consumption due to the use of appliances purchased had effected a lower rate in favor of the customer.

### THE FIRST MONTH'S RESULTS

The two-part rate was put into effect in January, the month of the greatest use. For that month, if the energy had been billed at the old 10-cent rate, the company would have billed about \$90,000; actually it billed \$73,000. The number of bills increased was 5,342 and the number decreased was 23,345. The total amount of the increases for the first month was \$1,007 and of the decreases \$17,938. The smallest bill decreased was 92 cents and the largest bill increased was \$16.68. The average rate received was 8.1 cents per kilowatt-hour. In a press statement discussing the first month's experience the company pointed out that it was sure that those who were not then making at least an average use of the benefits of electricity in the home were paying to others for coal, oil, gas or labor far more money than if they had hired the company at the new energy price of 6 cents to perform a greater amount of service far more conveniently for the user.

would be made either to the 10-cent rate or, if conditions warranted, to such lower rates than 10 cents as costs at that time would justify. It was also pointed out that the new rate meant immediate losses to the company, but that it was expected it would make possible wider uses of electricity which would recoup that loss. Window cards, bill inclosures each month, charts and appliance exhibits in the sales office, "cents-per-hour" meter equipment, notices regarding the greater use of lamps and other forms of advertising were used to impress the public with the possibilities of the new rate.

The promise to give the new rate a year's trial with the alternative of a restoration of the former or a diminished rate in case of dissatisfaction made an instant appeal to the Hartford press, and the company received very favorable editorial comment to the effect that the rate was a fair proposal. The very same papers which were hostile to a uniform service charge of the gas company, though they declared that this was another form of service charge, urged giving it a trial.

There were many customers who objected at the outset to the new rate and quite a number whose total bills were increased. These were of the opinion in some cases that the company was trying to "fake" an advance on the community in the guise of a reduction. They were answered by a coupon (Fig. 2) on every appliance sold during the year which stated that the company would refund them the total amount that their bills were increased during the year by the new rate on the purchase of any appliance made during the year. If their bills were increased \$3 and they bought a five-dollar flatiron, they would get a credit of \$3 on the iron at the end of the year. About 350 of these coupons were sent back for a refund, if any was due, and of these coupons the company paid out \$204 in refunds on about fifty of the coupons. The other 300 received a note stating that the company was glad to see that the rate had worked so much to their advantage during the

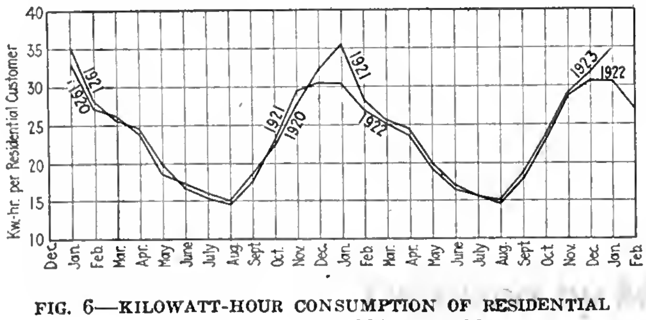

FIG. 6—KILOWATT-HOUR CONSUMPTION OF RESIDENTIAL CUSTOMERS, 1920, 1921 AND 1922

It was a great surprise to the company to find so much "dead wood" on its lines as the five thousand customers whose bills were increased represented. Those customers whose rates had been increased had been a drag on the costs of serving the community with electric light and power. The small customers *per se* are not "dead wood," the use of the service being the criterion, in conjunction with the load factor of each installation.

An analysis of these same customers' accounts in January, 1923, after a year's experience with the rate, showed that almost 60 per cent of them had so increased their use of energy that they had become gainers under the rate and could no longer be classed as "dead wood."

Measurements of areas were taken from the Sanborn insurance or assessors' maps, and after the first month's billing customers were invited to check up their areas with the company's computations for correction by the latter in case of inaccuracy. Resurveys resulted for about 10 per cent of the total residence customers.

### PUBLIC INVITED TO REGISTER DISSATISFACTION

The climax of the first year's use of the rate came in the insertion by the company of a letter form (Fig. 3) in the local newspapers addressed to the Mayor of Hartford, by the use of which customers dissatisfied with the combination rate might indicate their preference for the former 10-cent rate. With this letter form was published a statement signed by Mr. Ferguson, thanking the public for its fair trial of the new rate and pointing out that the public had paid \$97,724 less for the total of its household electric bills in 1922 than it would have paid if billed under the old rate. At the close of the year there were only about 25 per cent as many complaints on bills as under the old rate, and the reduction in the cost of electricity had made possible a greatly increased use of labor-saving appliances in the home. To keep its word about offering to restore the old 10-cent rate and to make sure that it had not misjudged public sentiment, the coupon letter to the Mayor was published. This advertisement was run

for nearly a week. The Mayor agreed to tell the company the number of complaints received, and in a letter (Fig. 4) he conveyed the extraordinary information to it that from 34,599 residence lighting customers only sixty-seven coupons expressing a preference for the old rate were received. This represented only about two-tenths of 1 per cent of the total customers concerned.

However, in order that even this small percentage of customers might be satisfied, the company announced in its advertisement (Fig. 4) two options to the 6-cent rate: First, for any use, 10 cents per kilowatt-hour, with no area charge but with a minimum bill of $1 per month; second, for cooking (including light and other household uses), 2 cents per kilowatt-hour plus an area charge of 12 cents per 100 sq.ft. per month plus a range charge of 50 cents per kilowatt installed. It is interesting to note that only twenty-seven customers availed themselves of the 10-cent option.

A diagrammatic story of the effect of the combination rate is told in Figs. 5 and 6.

This story extends back to August, 1920, and shows the condition existing under the old form of rate previous to and after its increase. The result of the earlier increase in rate to 10 cents, necessitated by high fuel costs, etc., was a marked decrease in the percentage of monthly consumption increases, after the first two months' use. May, October and November of 1921 show the effect of changes due to the daylight-saving shifts and to a shift in the latter two months of meter-reading dates that should be averaged over the months before and after to get a true picture.

The first month of the new rate, which covered the energy used in December before its announcement, shows a loss in residential consumption, but since this time the gain has been fairly uniform. At the expiration of the year the rate of gain of two years previous had been re-established and the per-customer use of current had increased 20 per cent up to March 1.

The consumers of Hartford have been convinced that the new form of rate is to their advantage, and the story of this rate and its introduction shows that the difficulties which many central-station men have feared as a result of an attempt to employ such a combination rate have not materialized. The use of this form of rate is being taken up and effectively applied in many other parts of Connecticut.

### THE SKY BRIGHTENS FOR RESIDENTIAL SERVICE

In closing, Mr. Ferguson's advice to central-station companies as presented at the Worcester meeting previously mentioned is of interest. Referring to the psychological aspects of rate modification, he said: "Take advantage of your present strategic position with the relatively high domestic rate to remove the resistance of wiring costs in the method outlined, and then see to it that your salesmen go at their work with enthusiasm and the feeling that the company is behind them in their efforts and that it expects them to make good. And when they have made good and we are serving a fully electrified customer for every four and a half of our population, we will supply for residential use not less than 150 kw.-hr. per capita per year instead of the present insignificant amount, which seldom exceeds 60 kw.-hr. per capita and in many places is as low as 20 kw.-hr. per inhabitant. And when we add to this the cooking and refrigeration possibilities, we cannot but feel that our industrial salesmen will have to look sharp or they will be completely outdistanced."

A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute

## High-Voltage Cables in Holland

*To the Editors of the* ELECTRICAL WORLD:

I noted with interest the letter of D. M. Simons in the issue of Dec. 2, 1922, page 1217, stating the difficulty of obtaining exact information about foreign high-voltage cables, and I am glad to be able to afford you some details about the cables used in Holland. The company of which I am chief engineer uses both single and three-core 50,000-volt cables. The former are Siemens cable, the latter manufactured by the Callender Works in England. Both kinds of cable are operated at 10,000 volts pending the arrival and installation of 50,000-volt substation apparatus.

The statement that the three-conductor cable developed considerable difficulties is not correct. Operation at 10,000 volts gave no difficulties at all. With 50,000 volts we have not yet had experience, but severe tests lately made have led us to expect that there will be no trouble with this voltage either. We intend to start the 50,000-volt service within three months, and the results will be made known in due time.

W. L. C. BRUNINGS,
Chief Engineer.

Prov. Electriciteitsbedrijf van Noord-Holland,
Haarlem, Holland.

## Sludge Formation in Transformer Oil and Solubility Thereof

*To the Editors of the* ELECTRICAL WORLD:

The experience of naphtho-chemists has shown that transformer oils in contact with air produce sludge very slowly at any operating temperature below 75 deg. C., provided that the oil is of good quality and no catalysts are present. At the operating temperatures above this point the sludge formation is materially increased. Laboratory practice has shown that an accelerated test can be carried on conveniently at 150 deg. C. (Scientific Paper No. 112-B reviews a number of such practical tests.) Consequently a series of tests upon a certain representative transformer oil were made to ascertain the effect of heat in producing a more sludgable oil. The greater the amount of unsaturated constituents present within the oil, the shorter the life becomes because of the greater tendency to form deposits.

Oil was heated at 144 deg. C. for three days. A small portion was taken, allowed to cool, diluted with an equal portion of petroleum ether and allowed to stand a day. The sludge was separated upon a Gooch filter and the filtrate treated by the Babcock absorption method for unsaturated constituents. Portions of the oil were sampled at intervals and tested in a similar manner. The results appear in the following table:

| Kind of Oil | Hours Heated | Temperature (Deg. C.) | Unsaturated Constituents (Per Cent) |
|---|---|---|---|
| Transformer oil | No | 25 | 6.9 |
| Flash, 141 deg. C. | 72 | 144 | 10.0 |
| Viscosity, 50 | 174 | 148 | 13.1 |
| | 384 | 148 | 15.0 |
| Saybolt seconds | 452 | 148 | 21.2 |
| | 650 | 148 | 23.6 |

After 650 hours' heating at 148 deg. C. the oil became thick and full of sludge. If the oil is filtered hot, without dilution, not all the sludge can be separated. If allowed to stand two weeks with no initial filtration, the sides of the containing vessel become heavily coated with sludge and some varnish.

It is a significant fact that parallel runs similar to those shown in the foregoing table were made with nitrogen and carbondioxide, and no sludge was formed. In parallel tests, but with a float arranged within the container, closely fitting along the sides thereof and floated upon the surface of the oil, only a slight coloration of the oil was noticeable.

Sludge-free oil dissolves only a very small amount of sludge. Very finely divided deposit which had been freed from oil by several naphtha extractions was shaken up with a high quality transformer oil ("Wemco A") at various temperatures and held there while shaking for one hour. The sludge was filtered off, washed, weighed, and the percentage of solubility calculated. Results of these tests are given below:

| Sample No. | Temperature (Deg. C.) | Solubility of Sludge in Oil (Per Cent) |
|---|---|---|
| 1 | 12 | 0.001 |
| 2 | 21 | 0.003 |
| 3 | 63 | 0.010 |
| 4 | 105 | 0.013 |
| 5 | 145 | 0.021 |

It is obvious from the above data that the oil-forming sludge tends to create a deposit upon the cooler parts of the transformer.

East Pittsburgh, Pa.

## Electrical Energy on the Farm

*To the Editors of the* Electrical World:

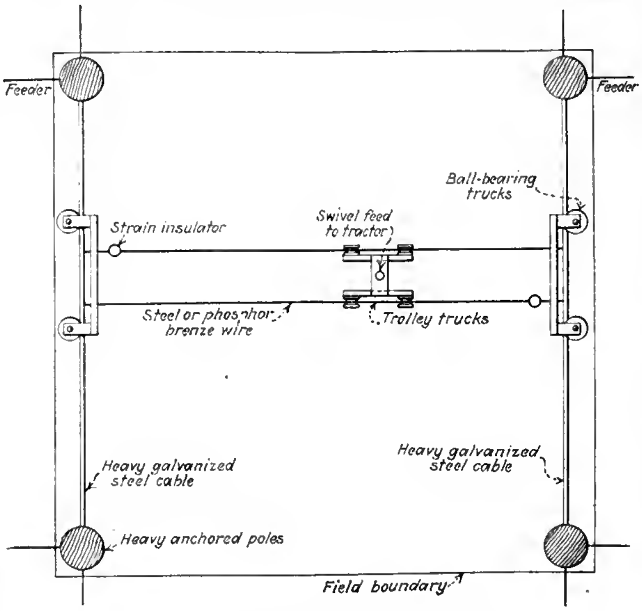
I read with considerable interest your article on the uses of electrical energy in agriculture and, having myself given the subject considerable attention, I should like to present my views.

The suggested equipment, I believe, is somewhat impracticable, considering that plowing constitutes probably only 20 per cent of the entire power work on a cultivated crop. With any cable-haulage system or with a trailing cable the damage done to the crops would prohibit use of the system.

I think a system such as I have outlined in the accompanying sketch would be superior inasmuch as the tractor can move anywhere in the field without changing any of the gear, as must be done with electric drive to compete with the present kerosene tractor. The cables carrying the trolleys can be made of ½-in. standard galvanized guy cable, which will have carrying capacity enough for the purpose. The motor in the tractor need not be of more than 15 hp., which with any kind of economical gearing will give a net pull at the drawbar of 8 hp. The trolley on the tractor is so built that it can make a complete swivel. The two trolley wires have a wide space to prevent short circuits, and the trolley trucks have four wheels, which should be ball-bearing the same as those of the trucks that carry the trolley wires.

I think it is possible to care for a field of 10 acres with the above system, and with proper planning the steel cable for one side of the field can be made to carry the trolley for the adjacent field.

A farmer, contrary to the seemingly popular opinion, has considerable discernment and must be shown that his initial investment is not going to be so high that he can run a kerosene tractor on the interest. An outfit which will satisfy the farmer, therefore, is one where, in the first place, the initial cost is low. In the second place, he must be able to run it all over his property and do all kinds of work with it. In the third place, he should be able to use the motor for stationary



THE TRACTOR CAN MOVE ANYWHERE IN THE FIELD WITHOUT CHANGE IN CONNECTIONS

work in a way which will compare favorably with results from the kerosene tractor.

The central-station company should be alert and use its influence to make electricity possible for the farmer, and this cannot be done till there is some equipment produced that the farmer can use. The central station should figure on not more than a dollar per day for every horse displaced during the active season, which would give \$8 a day for the outfit I have suggested, a fairly attractive figure for a 15-hp. motor.

Inspiration, Ariz. Richard Gibbs.

## The World's Second Largest Reservoir

*To the Editors of the* Electrical World:

In your issue of Jan. 20, 1923, page 179, there is in the statement of Ambassador Gelasio Caetani a little inaccuracy which I beg to correct. Under the heading "Electrical Development in Italy," the Ambassador states: "On the Tirso in Sardegna a reservoir with 416,000,000 cu.m. capacity is being constructed. It will be the second largest in the world, ranging immediately after Assuan Dam, and will develop 50,000,000 kw.-hr."

The Møsvand Reservoir in Telemarken, Norway, furnishing power for the two Rjukan plants belonging to the A/S Rjukanfos of the Norsk Hydro-Elektrisk Kvælstofaktieselskap (Norwegian Hydro-Electric Nitrogen Company) of Norway, has a dam height of 14.5 m., a capacity of about 768,000,000 cu.m., and gives water sufficient to generate from 1,700,000,000 kw.-hr. to 1,800,000,000 kw.-hr. from a total utilized head of 536 m. This reservoir, therefore, still ranges next to the Assuan Dam.

Wilhelm Fleischer,
Supervising Engineer.
Norsk Hydro-Elektrisk Kvælstofaktieselskap,
Christiania, Norway.

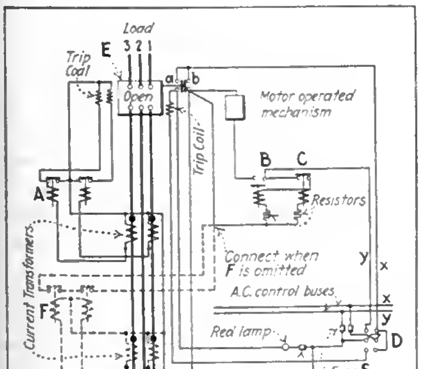
# Central Station and Industrial Practice

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Auto Reclosing Switches at Remote Substations

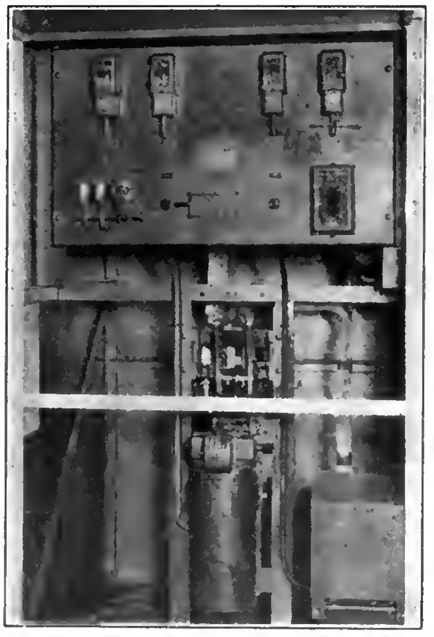
AT REMOTE substations, where the continuous attendance of an operator is not justified, the Tennessee Electric Power Company is installing automatic reclosing circuit breakers which operate on alternating current taken from the transmission lines. Hence no storage batteries are required. Such stations have already been installed at Athens, Sweetwater and Lenoir City. The control connections for the breakers, which are General Electric type, are shown in the accompanying diagram, while the simplicity of the Athens substation is shown by the photograph.

When a short circuit or overload beyond the setting of the overload relay *A* occurs, this relay operates with an inverse time characteristic and trips out the oil circuit breaker. The opening of the breaker closes auxiliary switch *b*, energizing the reclosing relay *B* and the notching relay *C*. After a definite time interval the former closes its contacts and starts the motor, which recloses the oil circuit breaker. At the same time the notching relay moves up a step and will begin resetting as soon as the breaker closes.



AFTER CLOSING SWITCH TWICE THIS EQUIPMENT BECOMES INOPERATIVE

A—Overload time-delay relay. B—Reclosing relay, time-delay closing, instantaneous opening. C—Notching relay. D—Control power switch. E—Oil circuit breaker and mechanism: (a) Auxiliary switch, open when main switch is open; (b) Auxiliary switch, closed when main switch is open.



SIMPLICITY OF CONTROL APPARATUS FEATURE OF AUTOMATIC RECLOSING EQUIPMENT

If the trouble has not cleared from the line by the time the breaker is closed, the overload relay will open it again and the same cycle will be repeated, the notching relay moving up another step. If the trouble still continues the breaker will open a third time, and further automatic operation of the equipment will be prevented by the notching relay, which opens its contacts on the third step and must be reset by hand before operations can be resumed.

The circuit shown by the dotted lines is a further protection which may be incorporated if desired and which locks the breaker open in case of severe short circuits that are beyond the interrupting capacity of the oil circuit breaker. By throwing the control switch *D* to the down position, the breaker is tripped, and it cannot be closed with the switch in that position. This feature assures the safety of anyone inspecting the breaker and equipment. Throwing the control switch to the upper position causes the automatic operation of the breaker to be resumed.

## Adjustable-Speed Drive for Steel Mills

TWO adjustable-speed units aggregating 1,000 hp. for steel-mill drive, embodying some very recent developments, are described in the recent report of the iron and steel industry committee of the A. I. E. E. The main drive in these units consists of a mill-type induction motor with a direct-connected synchronous machine on the same base.

The auxiliary machine consists of a frequency converter driven by a synchronous motor. In the operation of the equipment no torque is developed by the frequency converter and the driving motor supplies the power for windage and friction of the auxiliary set. In the operation and during regulation the secondary of the main induction motor is connected to the commutator of the frequency converter and the slip rings of the frequency converter are connected to the synchronous machine connected to the mill. This machine has the property, when driven at synchronous speed, of taking the frequency impressed on the commutator and adding to or subtracting from the line frequency, which in this case is the secondary frequency of the induction motor. The voltage delivered at the commutator end of the frequency converter is the same voltage as that impressed on the slip-ring end and as supplied from the synchronous motor. The synchronous machine on the main set and the synchronous driving motor for the frequency converter are excited with direct current.

After starting the main motor in the regular way as an induction motor, the secondary circuit is transferred to the frequency converter. This is done with no field on the synchronous machine and with the frequency converter running at synchronous speed. If it is desired to use a speed other than the normal, the rheostat in the synchronous machine field is manipulated, putting a field on this machine.

This causes the synchronous machine to generate a certain voltage which is transmitted through the frequency converter and impressed on the secondary of the main induction motor. This voltage, according to whether it opposes or helps the generated secondary voltage, causes the set to slow down or speed up. Any speed within the speed range can be obtained by simply adjusting the above-mentioned field rheostat, giving the desired practical range of speed above and below normal or induction motor speed.

FIELD EDITOR ELECTRICAL WORLD.

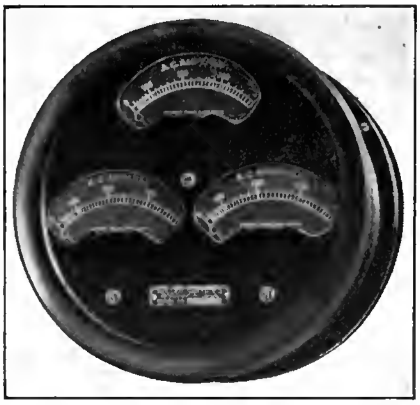
## Triplex Ammeter Used for Three-Phase Circuits

THE installation of ammeters on three-phase circuits is often governed by the available switchboard space and the expense involved. The use of an ammeter switch with only one ammeter is apt to cause interruptions to service when ground relay protection is installed. The West Penn Power Company has had developed in accordance with its specifications a triplex ammeter, such as is shown in the accompanying illustration, which has the following outstanding features:

1. It is possible to take readings in the three phases simultaneously as contrasted with the usual scheme of having one ammeter and throwing it from one transformer secondary to another by means of the conventional jack.
2. It occupies much less space than three individual ammeters.
3. It possesses all the advantages of three individual ammeters in that any one of the three mechanisms can be reversed if necessary.



COMBINING OF THREE AMMETERS SAVES SPACE ON THREE-PHASE SWITCHBOARD

4. Each element is thoroughly insulated from the others.
5. Each element has its own zero adjuster.
6. While developed particularly for high-tension metering circuits, the triplex ammeter is being used in low-tension three-phase circuits in connection with suitable current transformers.
7. It is possible to keep three-phase circuits more evenly balanced as a result of such an ammeter, thereby tending to prevent overload interruptions which often occur.
8. The use of three individual elements tends to keep secondary circuits more evenly balanced.
9. Continuity of secondary circuits is more reliable than with some types of ammeter jacks which are apt to cause interruptions, especially when using ground relay protection.
10. High overload capacity.
11. Accuracy well within any desired value for such service.
12. Any one of the three elements may be removed without interruption to the circuit.
13. When used in large quantities the replacing of the new element is about as economical as making repairs.

The details of this instrument are as follows: The elements are of the electromagnet type, in which an efficient air damping scheme is used. All three elements are mounted on one rigid bakelite base, thus insuring proper insulation and providing against misalignment of parts, and in addition there is a bakelite barrier between each two elements. The over-all diameter is 7½ in. and the depth (not including studs) is 3½ in. Connections are in the form of rear studs, of which there are six, so arranged that they cannot turn.

In mounting the instrument it is necessary to drill six holes for the studs. These studs also serve to hold the instrument in place. The whole structure is dust-proof, moisture-proof and practically waterproof. Each scale is about 2¾ in. long. The scales are readable from about 20 per cent to 100 per cent of full-scale value. The average net weight per instrument is 5½ lb.

Relay Engineer.
West Penn Power Company,
Pittsburgh, Pa.

# Extracts from an Operating Code

BY FIELD EDITOR ELECTRICAL WORLD
New York, N. Y.

## Instructions for Operating Forced-Draft Fans

FORCED-DRAFT fans should be started under minimum load by having the damper closed when starting. This also prevents the furnace gases from being forced out of the side doors if the stack damper is not properly set. The main oil switch should be used only for the purpose of disconnecting electrical energy from fans, and if it automatically trips, then something unusual has happened which requires the attention of an electrical mechanic before starting the fans again. The following instructions for starting and shutting down forced-draft fans have been taken from the operating code of the Philadelphia Electric Company:

STARTING FORCED-DRAFT FANS

1. See that the forced-draft damper is closed.
2. Turn on the cooling water to the bearings.
3. Start the turbine or motor.
4. Inspect the oiling system and see that the gear case contains the proper quantity of oil and that oil rings, pumps, etc., are in operation.
5. Bring the unit up to speed.
6. Inspect the unit for excessive vibration, and if excessive vibration is discovered, report the trouble to the shift superintendent.
7. If the main oil switch (controlled at the boiler operating boards) should trip, have an inspection made by the electrical mechanic and any trouble corrected before closing again.

SHUTTING DOWN

1. Shut down the turbine or motor.
2. Turn off the cooling water.
3. Close the forced-draft damper.

## Testing Reverse-Current Trips

ACCORDING to the operating code of the Philadelphia Electric Company testing reverse-current trips on rotary converters and motor-generators should be done under the direct supervision of the substation supervisor or foreman. The only time that this test can be made is when the machine being tested is running in parallel with another source of direct current. The following instructions as abstracted from the above code should be followed for this test:

1. Cut in the field resistance slowly, observing the direct-current ammeter, until the reverse-current trip opens the circuit breaker. When the reverse-current relay is set at a high value, disconnect it mechanically from the circuit breaker, reverse the potential leads and load the machine until the relay operates. Reduce the load on the machine to zero. Trip the circuit breaker manually, using the reverse current tripping device.
2. Observe, if possible, the amount of reverse current which operates the trip.

## Test of Boiler Fired with Powdered Coal

A PRELIMINARY statement regarding the results of tests carried out at the Lakeside Station of the Milwaukee Electric Railway & Light Company by the fuel section of the United States Bureau of Mines, in co-operation with the research department of the Combustion Engineering Corporation of New York, has been issued by the Bureau of Mines. The main object of these tests was to determine the thermal efficiency, ease of operation and other particulars of a boiler equipped with specially designed furnace and burners for burning powdered coal. The boiler tested has 13,380 sq. ft. of heating surface and is one of eight boilers equipped with the Lopulco powdered coal system supplying steam to two 20,000-kw. turbines.

Twenty-six tests were run at rates of heat transference varying from 4,000 B.t.u. to 8,000 B.t.u. per square foot of boiler-heating surface, and the mean thermal efficiency attained was about 84 per cent, based on the gross calorific value of the fuel as fired. The efficiency varied little with the rate of steaming and its high value is accounted for by the small loss from incomplete combustion and the small amount of excess air, which varied from 5 per cent to 36 per cent.

The coal burned had a gross calorific value of from 11,500 B.t.u. to 12,800 B.t.u. per pound, containing 2 per cent to 5 per cent moisture, 33 per cent to 36 per cent volatile matter and 9 per cent to 13 per cent ash, and was so grounded that 89 per cent to 95 per cent would pass through a 100-mesh sieve. The ash had a softening point of 2,150 deg. to 2,450 deg. F., but did not fuse together at the bottom of the furnace because it was partly protected from the flame radiation by means of a series of water tubes connected to the boiler which were placed between the furnace bottom and the flame. A summary of the results of boiler tests is given in the accompanying table.

FIELD EDITOR ELECTRICAL WORLD.

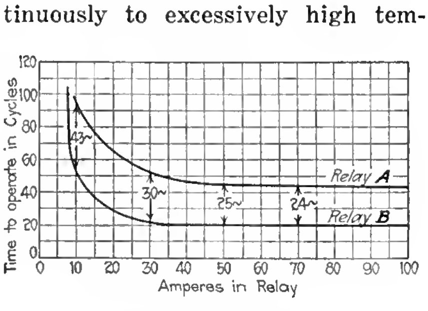
# Checking and Calibrating Relays in Place*

### Selecting Suitable Locations for Relays—Precautions to Be Considered Before the Actual Placing of Various Types of Protective Devices Into Service

IT IS important that relays be installed in a clean part of the station where there is plenty of light, minimum vibration and suitable temperature conditions. The relay equipments of the different lines or apparatus should be grouped on the panels at the proper height and clearly designated in order to facilitate thorough testing and inspection without accident of any sort such as operating a relay of equipment other than that being tested, from which serious consequences might come.

Generally speaking, there is not enough difference in temperatures of stations, except those of the outdoor type, throughout the year to be of serious consequence in affecting the operation of the relays. The temperature question should, however, receive consideration where relays are installed in unheated inclosures used with outdoor substations and required to function selectively with others in stations heated in the usual manner. It is possible that the error produced by a given change of temperature will affect different types of relays in different ways; that is, on one relay it may increase the time of operation and on another decrease the time. It would seem advisable not to install relays of the bellows type where they will be subjected more or less continuously to excessively high temperatures, on account of the likelihood of drying out the leather, with the consequent inaccuracies of operation.

Each relay equipment should be provided with facilities for opening the current circuits in such a man-



CHARACTERISTIC CURVES OF TYPICAL OVERCURRENT RELAYS

Relay A—8-amp. starting current; 50 amp. for opening within 45 cycles.

Relay B—6-amp. starting current; 50 amp. for opening within 20 cycles.

*This article, describing suitable locations for relays and outlining methods for checking and calibrating relay installations, is a continuation of the article printed in the Feb. 10 issue of ELECTRICAL WORLD, page 338.

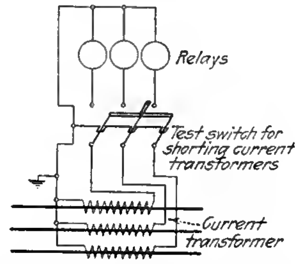
ner that the current transformers will be short-circuited and the relay terminals be available so that connections for calibration can easily be made. This device can be made up in the form of a knife switch with short-circuiting clips and test terminals placed in a small box, which can be locked if desired. When relays make use of potential, fuses can be used for protection and for the purpose of disconnecting the source of voltage. These current or potential cut-outs should, of course, be grouped with the relays or else clearly designated so that no mistake will be likely to be made in opening the circuits.

It will be found very convenient to have a source of alternating current of 110 volts or 220 volts available near the relay equipments to use for testing and calibrating purposes.

After the relay wiring on any given installation has all been completed, the correctness of connections can be checked by opening the circuits and talking over the various wires through the use of head telephones. It is generally not advisable to make tests of this sort by the use of a telephone receiver and battery depending upon a click in the receiver as an indication of completed circuit as the capacity between leads will often give a false indication. After all the wiring has been checked in this manner additional checks should be made on most types of installations to make sure that everything is correct.

In addition to the above, excess-current relays should be operated electrically, making use, if desired, of a small alternating-current test set such as was described in the previous article referred to in the footnote on page 925.

Directional (reverse-power) relay installations should be checked under load conditions to make sure that phase relations, etc., are correct and that the contacts are open with the normal direction of energy transfer. A device which may be used for this is described in the above-mentioned article.



MAKING RELAY TERMINALS AVAILABLE FOR TESTING PURPOSES

Double-winding differential relays such as are used for the protection of transformer banks may be checked for balance by removing the relay core and placing therein a test core provided with a winding which is connected to a voltmeter. If under load conditions an exact balance does not exist in the relay, a voltage will be induced in this winding and indicated on the voltmeter. This method of checking differential relays leaves nothing to be assumed and can be carried out without removing any electrical connections.

It should be kept in mind that the value of differential-relay protective systems lies to a great extent in their ability to isolate defective equipment quickly, and auxiliary relays or any factors which increase operating time appreciably are to be avoided.

TEST CORE USED WITH DIFFERENTIAL RELAYS MADE WITH 700 TURNS OF NO. 31 WIRE

After all tests have been made, care should be used to make sure that any circuits opened during the tests are properly closed and that the relays actually trip the circuit breakers as desired.

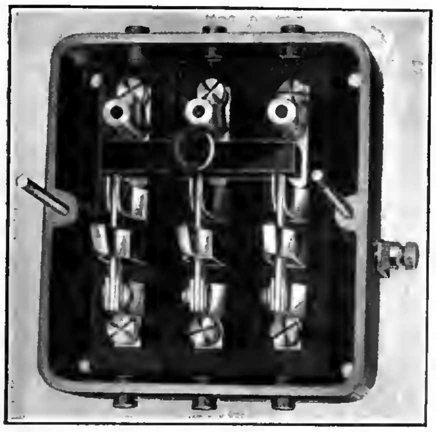
In developing methods for testing other types of relay installations than those described herein it should be kept in mind that it is inadvisable to use any method of test that requires extensive opening of circuits or changing of adjustments on account of the possible failure to restore them to their original condition at the end of the test. After it has definitely been determined that the relay protective system is in satisfactory operating condition, the relays should have their final setting.

In determining the exact time settings to be employed with excess-current time-limit relays it is generally considered that the relays with the minimum setting should have enough time delay so that they will not open the breaker under surges or troubles which do not require that that particular section of the system be isolated. This means that the relays which are set for minimum time will probably have an adjustment of 20 cycles (on the basis of 60 cycles per second and operation of the relay on the flat part of its characteristic curve). The relays with the next higher time setting, which must function selectively with these, should be set for about 45 cycles or 50 cycles. This time difference is made up as follows: After the first-mentioned relay has closed its contacts at the end of 20 cycles, the auxiliary relay will close its contact from 1 cycle to 5 cycles later, and an additional time of about 10 cycles or 12 cycles will be required from the instant voltage is impressed on the opening coil of the circuit breaker until the short-circuit current is actually opened.

The time for the breaker to open the short-circuit current must, of course, be included, as the relay with the higher time setting, which should not close its contact, keeps on moving closer to the point where its contacts close until the short-circuit current is actually interrupted. It is also advisable to include about 10 cycles additional time between the settings of the two relays to take care of any inaccuracies in the relays, errors in settings and sluggish opening of the circuit breaker.

It is advisable where relays of different types are used to function se-

lectively together that the characteristic curves be plotted according to the settings used so that the time difference under all conditions can be checked to make sure that selective action will really be obtained. The curves on page 925 show characteristic instances of typical relays plotted so as to show the time difference between the relay settings at various current values. This shows clearly the variation of time at the



SWITCH FOR SHORTING CURRENT TRANSFORMERS WHEN TESTING RELAYS

different points on the curve and the necessity for making sure that this time is sufficient at all points.

Every care should be used in making the final tests and inspections on relays to insure their functioning in the desired manner. It is almost impossible to overemphasize the need for exact work in connection with relay-protecting systems. If the person who inspects and adjusts relays is a keen observer, he may notice little things which are not quite as they should be that may lead to serious trouble if not corrected.

In a subsequent article it is planned to discuss routine tests and calibration of relays which should be made in order to insure that the relays will function properly.

Philadelphia, Pa.

## Blasting Post Holes Saves Hours

SOME interesting experiences in digging post holes in frozen ground for a light and power company are reported by Charles Van Zandbergen, Onalaska, Wis. Digging by hand, it required from eight to nine hours for one man to excavate a hole 6 ft. deep and 2 ft. in diameter. Mr. Van Zandbergen was able to accomplish the same work in a few minutes by the use of dynamite, using one stick of 40 per cent to break up the frozen ground and later three sticks to loosen it further down. A workman afterward trimmed the sides and cleaned the hole out, the entire operation with dynamite taking about one hour. Besides the great saving of time by the use of dynamite under these conditions, there was an appreciable saving of money.

## Sidelights on Electric Furnace Maintenance

AN ELECTRIC furnace with intelligent handling should last at least eight years, and perhaps twelve, against a life of four to six years for an oil furnace, according to a recent discussion before the Boston Section of American Society for Steel Treating. It was pointed out that whereas ribbon-type heating units are designed for continuous life at normal service, if burn-outs occur repairs can easily be effected by lapping the strips over one another a few inches and welding the edges only. If cross-welding is undertaken, the uniformity of the material may be disturbed at critical areas. It was also stated that the cost of replacing hairpin-type resistors is excessive in comparison with replacing ribbon-type resistors.

In the case of one rotary furnace with ribbon-type resistors mounted on the inside walls, the cost of repairs in three years' operation has not exceeded $25. No trouble was experienced from the scaling off and short-circuiting of coils unless very high temperatures considerably above 1,800 deg. F. were encountered. In some processes where about 2,000 deg. F. is required the furnace owner must be prepared at present to obtain a somewhat reduced life of ribbon-type resistors, this being about two months in one installation operated at 2,050 deg. F. Researches are now under way looking toward the development of resistor metal capable of operation at temperatures 300 deg. to 400 deg. above present conservative limits, and in due course there may be an advance of electric heating into the difficult fields of treating high-speed tool steel and even of forging. The advantages of electric heating in industry continue to spread. Gears formerly treated in fuel-fired furnaces in automobile manufacture had to be sand-blasted after heating. This frequently changed the shape of the teeth and always added to the manufacturing cost. Since the advent of the electric furnace it is necessary only to use the wire brush on such gears, with much better results.

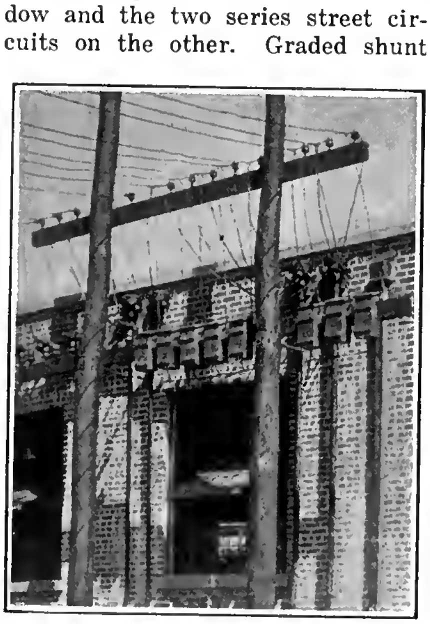
## Ample Space Provided for Outgoing Lines

IN A SMALL power plant where the outgoing feeders consist of two two-phase, four-wire, 2,300-volt commercial feeders and two series street-lighting circuits an arrangement of the circuits as shown in the accompanying illustration provides plenty of room for the lineman to work on the lines or poles and presents a neat appearance. All the lines are accessible either from the roof or from the poles. As the ground is very sandy and loose the poles were tubbed and in addition they were bolted to the building. This gave a very rigid and safe construction.

From the switchboard the feeders run underground and are lead-covered cable in conduit. The two commercial feeders come up outside the building on one side of the window and the two series street circuits on the other. Graded shunt



ARRANGEMENT OF FEEDERS PROVIDES PLENTY OF ROOM FOR LINEMEN

resistance multigap arresters are provided for the commercial circuits and single-pole horn arresters for the series circuits. Separate grounds are provided for the arresters on the series circuits and the arresters on the commercial circuits.

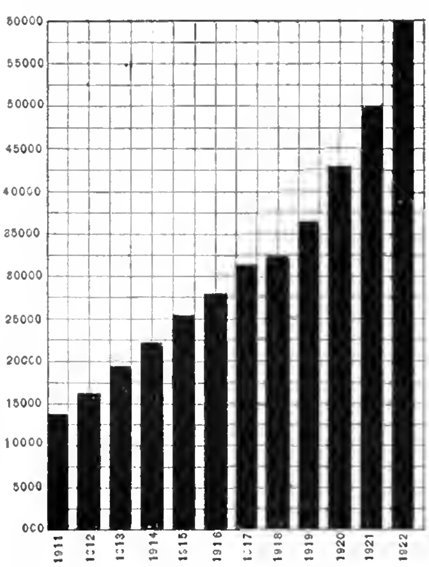
# Central Station Business

Advertising, Selling and Service Methods
Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences

## Central-Station Development at Providence

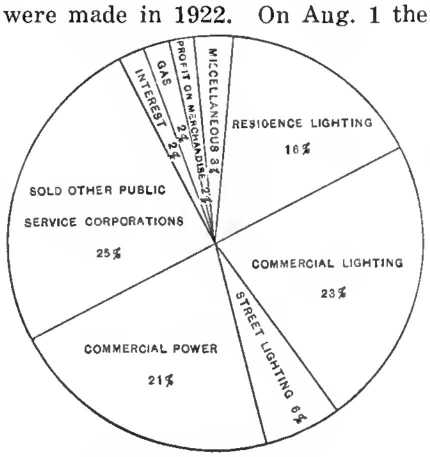
NOTEWORTHY expansion in the plant and service of the Narragansett Electric Lighting Company, Providence, is emphasized by President E. A. Barrows in his report to stockholders for 1922, and the excellent public relations of this, the second largest central-station company in New England, are also dwelt upon. During the year recently ended the total revenue was $5,574,825, a gain of over 10 per cent above 1921. The net income was $1,319,664, or more than 29 per cent above the preceding year and there was a gain of 20 per cent in station output, which reached a total of 277,993,260 kw.-hr. This output is nearly 300 per cent larger than it was six years ago. About $4 of capital is required for every dollar of new business obtained by this company.

The company has 59,985 customers, a gain of 10,176 during the year. This is the largest increase in customers in any year of the company's history. Old houses to the number of 2,462 were wired and stores to the number of ninety-nine in 1922, requiring the installation of 4,393 meters. The estimated gross revenue from this business alone is $110,000. It is the intention during 1923 to continue this work, as there are still fully 15,000 unwired houses in the territory. Gross sales of merchandise in the electric shops of the company totaled $569,400.



INCREASE IN CUSTOMERS DURING LAST TWELVE YEARS

Two important rate reductions were made in 1922. On Aug. 1 the clause in the schedule providing that no bills for house lighting should be less than 9 cents net per kilowatt-hour was eliminated, all electricity under this rate being sold for 7 cents per kilowatt-hour plus a monthly service charge of 50 cents. It is estimated that the elimination of this so-called "stop clause" will save the public about $140,000 during the first year. On Sept. 1 a further decrease from 7 to 6.9 cents per kilowatt-hour was made.



PROVIDENCE COMPANY'S SOURCES OF INCOME

The use of fuel oil was continued with marked economy during the year. Ninety-six per cent of the fuel used was oil and 4 per cent coal, the combined total being 188,506 tons. Of oil the company burned 942,244 barrels, and the company's customers were saved a large sum of money compared with the cost of service on a coal basis.

The company has begun gradually changing over its noted 250-volt lighting system to 104 volts. This change is planned in order that there may ultimately be a uniform voltage over the entire system, as is the case with the great majority of companies throughout the country.

## House Wiring on Trial Booms Business

AGREEMENTS to the number of 997 for house wiring were made in 1922 on the system of the Edison Electric Illuminating Company of Boston, a gain of 95.8 per cent over the previous year. During the year a thirty-day trial installation feature was adopted, the financing of which was done by the contractors on a ten-monthly payment basis. This trial feature, according to L. R. Wallis, superintendent of the sales department, has aided materially in securing this class of business, and up to the close of the year not a single instance had occurred where a customer failed to accept the installation at the end of the thirty-day trial.

The total number of houses wired during the year under these agreements represented an outlay for wiring of $170,604, or an average price per house of $171.12. The average number of sockets per house was twenty-five, compared with twenty-two in 1921, and in the latter year the average price per house was $178.33. The total connected load added by these wiring jobs was 1,257.6 kw., yielding an estimated annual income to the company of $41,224. In 1921 509 houses were wired. Boston and Somerville led the other municipalities served by the company with 309 and 266 house-wiring agreements respectively. The contractor making the largest number of agreements was E. C. Sanderson of Winchester, who handled 330 contracts.

## Advertising Security Sales on Company Letters

"CATCHY" sentences on the bottom of all outgoing letters form one of the methods of advertising the sale of its securities to customers recently used by the Central Indiana Power Company and its subsidiary companies in a customer-ownership campaign. Altogether

sixty-six of these sentences were used. A schedule was made up which started with No. 1 on a given day on all of the properties. The second day No. 2 was used, and so on for each succeeding day. Following are typical examples of the sentences. They were purposely made short enough to be read at a glance, aiming to hold the attention of the reader and make him ask for more information:

No. 1. Central Indiana Power Company owns electric companies operating in 103 communities in Indiana.

No. 2. Central Indiana Power Company's 7 per cent cumulative preferred stock nets better than 7.69 per cent on money invested.

No. 9. Central Indiana Power preferred stock can be purchased for cash or on partial-payment plan.

No. 16. Any employee of our company will be pleased to explain Central Indiana Power preferred stock.

No. 37. Central Indiana Power Company has paid forty-two consecutive dividends.

No. 43. Dividends on three shares of Central Indiana Power Company cumulative preferred stock will pay your light bill for a year.

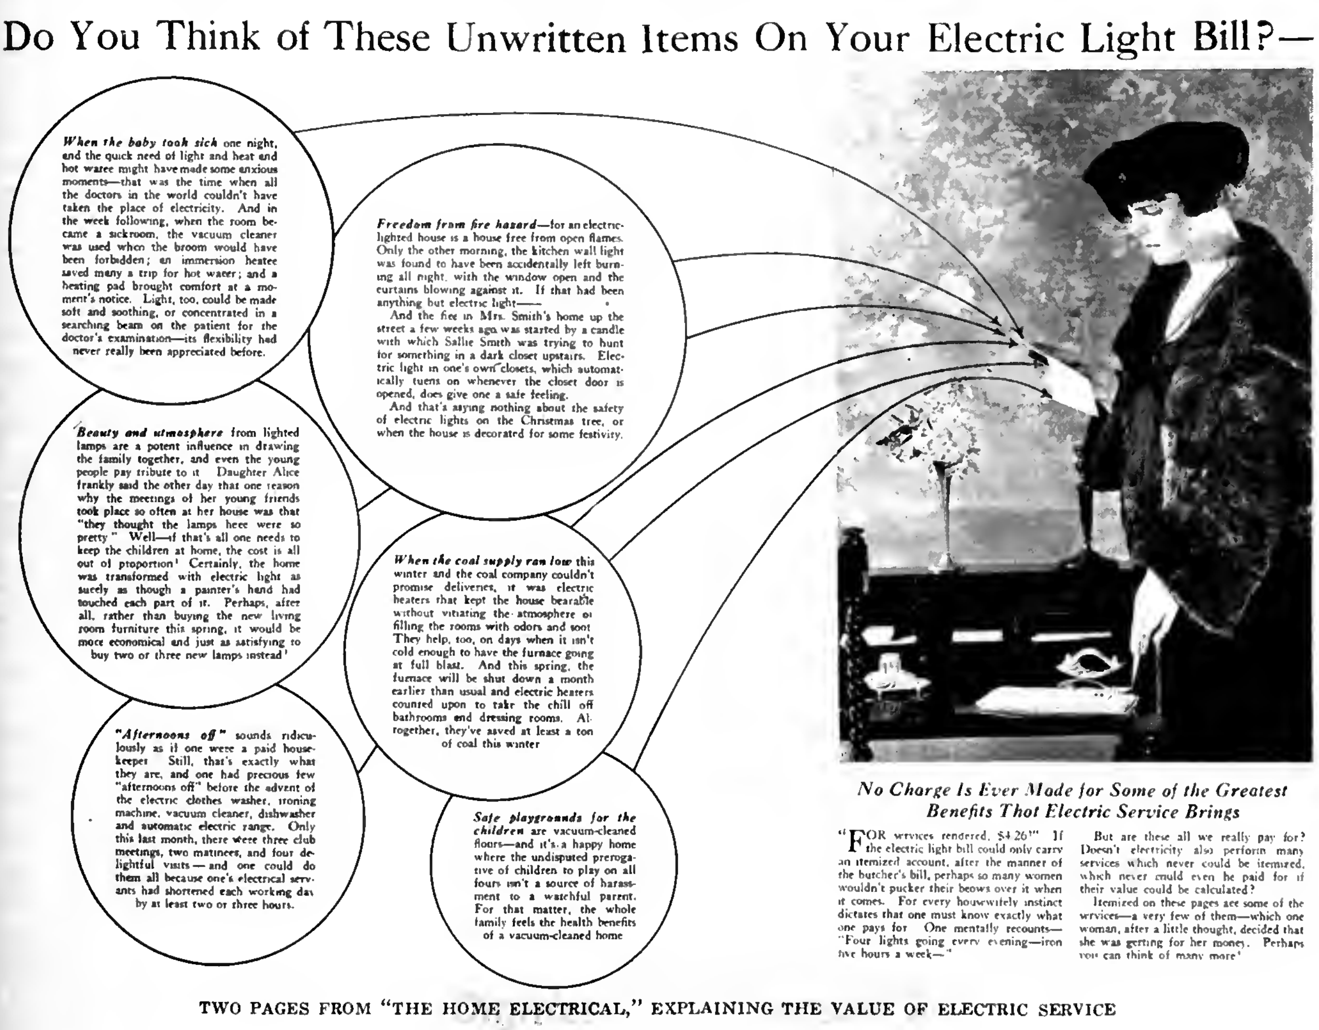
No. 53. As long as people need light Central Indiana Power Company cumulative preferred stock will pay dividends.

## Central Stations Using an Electrical Pictorial for the Home

THESE two pages are reproduced from a small publication entitled *The Home Electrical*, which has recently made its appearance. It is a distinct innovation in electrical publishing, for its purpose is to carry the message of electric service into the home in behalf of the central station.

For the purpose of drawing the line sharply between ordinary advertising and this type of educational reading several utility companies who have been for several months distributing *The Home Electrical* to their consumers are sending out this little pictorial in special envelopes marked "From the office of the President, United Light & Power Company." This secures attention, and the fact that the publication bears no name but that of the publisher is impressive. It is received as, and in fact is, an interesting independent picture-folder sent as a courteous gift. Therefore in addition to its educational influence it has a distinct public relations value. Each month the articles and pictures are devoted to some seasonable theme—housewiring, Christmas gifts, labor savers, electrical convenience and so on.

These central stations are taking advantage of the fact that people are *interested* in the household uses of electricity; that there is a popular appetite for information on this subject. They believe that men and women want to know more about it, and that there is an opportunity for the electrical industry to tell them many things, both in pictures and in facts, beyond the scope of the ordinary advertisements of light and power companies, manufacturers, jobbers, contractors and dealers whose messages usually have immediate selling as their chief objective. *The Home Electrical* has been developed as a medium for telling this more general story of electricity in our daily living and is designed to be distributed by central station companies to their residence customers. It is published by *Electrical Merchandising*, New York.



Do You Think of These Unwritten Items On Your Electric Light Bill?—

***When the baby took sick*** one night, end the quick need of light and heat end hot waree might have made some anxious moments—that was the time when all the doctors in the world couldn't have taken the place of electricity. And in the week following, when the room became a sickroom, the vacuum cleaner was used when the broom would have been forbidden; en immersion heatee saved many a trip for hot waeer; and a heating pad brought comfort at a moment's notice. Light, too, could be made soft and soothing, or concentrated in a searching beam on the patient for the doctor's examination—its flexibility had never really been appreciated before.

***Freedom from fire hazard***—for an electric-lighted house is a house free from open flames. Only the other morning, the kitchen wall light was found to have been accidentally left burning all night, with the window open and the curtains blowing against it. If that had been anything but electric light——

And the fiee in Mrs. Smith's home up the street a few weeks ago was started by a candle with which Sallie Smith was trying to hunt for something in a dark closet upstairs. Electric light in one's own closets, which automatically tuens on whenever the closet door is opened, does give one a safe feeling.

And that's saying nothing about the safety of electric lights on the Christmas tree, or when the house is decorated for some festivity.

***Beauty and atmosphere*** from lighted lamps are a potent influence in drawing the family together, and even the young people pay tribute to it. Daughter Alice frankly said the other day that one reason why the meetings of her young friends took place so often at her house was that "they thought the lamps heee were so pretty." Well—if that's all one needs to keep the children at home, the cost is all out of proportion! Certainly, the home was transformed with electric light as surely as though a painter's hend had touched each part of it. Perhaps, after all, rather than buying the new living room furniture this spring, it would be moce economical end just as satisfying to buy two or three new lamps instead!

***When the coal supply ran low*** this winter and the coal company couldn't promise deliveries, it was electric heaters that kept the house bearable without vitiating the atmosphere or filling the rooms with odors and soot. They help, too, on days when it isn't cold enough to have the furnace going at full blast. And this spring, the furnace will be shut down a month earlier than usual and electric heaters counted upon to take the chill off bathrooms end dressing rooms. Altogether, they've saved at least a ton of coal this winter.

***"Afternoons off"*** sounds ridiculously as if one were a paid housekeeper. Still, that's exactly what they are, and one had precious few "afternoons off" before the advent of the electric clothes washer, ironing machine, vacuum cleaner, dishwasher and automatic electric range. Only this last month, there weee three club meetings, two matinees, and four delightful visits — and one could do them all because one's electrical servants had shortened each working day by at least two or three hours.

***Safe playgrounds for the children*** are vacuum-cleaned floors—and it's a happy home where the undisputed prerogative of children to play on all fours isn't a source of harassment to a watchful parent. For that matter, the whole family feels the health benefits of a vacuum-cleaned home.

*No Charge Is Ever Made for Some of the Greatest Benefits Thot Electric Service Brings*

"FOR services rendered, $4.26!" If the electric light bill could only carry an itemized account, after the manner of the butcher's bill, perhaps so many women wouldn't pucker their beows over it when it comes. For every housewifely instinct dictates that one must know exactly what one pays for. One mentally recounts—"Four lights going every evening—iron five hours a week—"

But are these all we really pay for? Doesn't electricity also perform many services which never could be itemized, which never could even be paid for if their value could be calculated?

Itemized on these pages are some of the services—a very few of them—which one woman, after a little thought, decided that she was getting for her money. Perhaps you can think of many more!

TWO PAGES FROM "THE HOME ELECTRICAL," EXPLAINING THE VALUE OF ELECTRIC SERVICE

## Pacific Gas & Electric Increases Free Allowance on Extension

AS A RESULT of easier financing conditions, together with lower rates of interest and generally better business conditions, a new and consirerably more liberal line extension policy than the one which has been in effect was adopted by the Pacific Gas & Electric Company, effective March 1. Under the new arrangement the company will make extensions at its own expense where the cost does not exceed $125 per customer or where the cost of the extension does not exceed five times the estimated annual revenue. Under the former policy the free limit was $80 per customer, or the company would spend not in excess of three times the estimated annual revenue. Following is the complete text of the new rules:

(1) *Residential.*—The company will make extensions for bona-fide residential consumers at company expense where cost of such extension does not exceed $125 per consumer, or where the estimated annual gross revenue equals or exceeds 20 per cent of the total cost of said extension and facilities necessary to supply service.

(2) *General.*—(a) Where the estimated annual gross revenue equals or exceeds 20 per cent of the total cost of the extension and facilities necessary to supply service, the company will, at its own expense, make all extensions on public highways necessary to supply electric service to applicants (except service to mines, temporary service or service of doubtful permanency).

(b) When the estimated annual gross revenue to be secured from any electric extension is less than 20 per cent, the company will, when business is of a permanent nature, pay all costs in connection therewith up to an amount equal to five times the estimated annual revenue, and any excess of cost over said amount shall be advanced as extension deposit by the applicant, subject to refund as follows:

If the total revenue during any period of five consecutive years exceeds the cost of the said extension and facilities paid for by the company, then the company will refund to the consumer an amount equal to such excess, provided that no refunds will be made after the tenth year and that the revenue during the tenth year for the purpose of determining the refund shall not be taken as more than the average revenue of the three preceding years.

If and when other consumers are connected within a period of ten years to the extension so made, then the company will make such refunds as may be necessary to make said extension deposit equal to the difference between the total cost of the extensions and facilities involved and the combined five-year revenue of original and additional consumers.

When an additional extension, requiring an advance on the part of the consumer, is made in connection with an extension upon which advances have been made, a refund will be made to consumer making such additional extension as outlined above. When such consumer or consumers have been reimbursed to the full extent of his or their advances, then the revenue derived from such additional extension will be added to the revenue of the original applicant for the purpose of computing the original applicant's refunds.

(3) *Rice Irrigation.*—(a) Where the estimated annual gross revenue equals or exceeds 50 per cent of the total cost of the extension and facilities necessary to supply service, the company will, at its own expense, make all extensions on public highways necessary to supply electric service to applicants.

(b) When the annual gross revenue to be secured from any electric extension is less than 50 per cent of the total cost of the extension and facilities necessary to supply service, the company will pay all costs in connection therewith up to an amount equal to twice the estimated annual revenue, and any excess of cost over said amount shall be advanced by the applicant, subject to refund as follows:

If the total revenue during any period of two consecutive years exceeds the amount of the extension and facilities paid for by the company, then the company will refund to the consumer an amount equal to such excess, provided that no refunds will be made after the tenth year and that the revenue during the tenth year for the purpose of determining the refund shall not be taken as more than the average revenue for the three preceding years.

## Convention Paper Increases Window Lighting

THE connected load in window lighting of a large department store served by the Fitchburg (Mass.) Gas & Electric Light Company was increased nearly 200 per cent as a result of presenting the customer with a paper on show-window lighting which was read at the last convention of the Illuminating Engineering Society. After offering the paper to the customer for perusal, the central-station sales department and the department store's window decorator conducted a series of tests which proved to the user's satisfaction that it would pay to use a higher intensity in his windows than had formerly been employed.

## What Other Companies Are Doing

**Washington, D. C.**—The growth of residential customers in this city is showing a remarkable increase. The growth of dwelling-house installation business continues in Washington on an increasing scale. For the first three months of 1923 orders for new connections received by the Potomac Electric Company were double the volume for the same period in 1922, which was the heaviest year in the history of the company. With the addition to the steam-power plant at Benning, the company estimates it will have sufficient boiler capacity for the next three years. Despite the fact that beginning with October the company had to go into the open market for coal its records show that its per kilowatt cost of producing electricity in 1922 was lower than in any previous year. This was attributed to increased efficiency at the plant and to highly satisfactory results from West Virginia coal, which was delivered on contract until October.

**California.** — Dates for the display of electrical homes in California under the direction of the California Electrical Co-operative Campaign have recently been set. The four different exhibits now definitely decided upon cover a period of two months. The dates are as follows: Fresno, April 12-29; San Francisco, May 3-19; San Diego, May 17-June 3, and Sacramento, May 31-June 16.

**Springfield, Mass.** — Without direct solicitation of new business, the United Electric Light Company secured a net gain of 3,754 meters in 1922, compared with 2,725 in the best previous year. Natural development of business, the effect of general electrical advertising and the co-operation of contractor-dealers are believed to be major factors in this growth of service.

**Beaver Dam, Wis.** — Electrically operated pumps for the municipal waterworks of this city were installed about a year ago, replacing steam-driven equipment. Power is supplied from the lines of the Wisconsin Power, Light & Heat Company. A comparison shows that during the past year the amount of water pumped electrically exceeded by 2,000,000 gal. that pumped during the previous year by steam, and the cost of operation was $2,000 less than for the preceding year.

**Boston, Mass.**—A gain of 65 per cent in kilowatts contracted for by the sales department of the Edison Electric Illuminating Company was attained in 1922 as compared with 1921. The total new business contracted for was 79,287 kw. The added motor load totaled 45,558 hp., against 20,646 hp. in 1921. New business results last year were the largest in the history of the company.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Progress in Steam Research.*—As a result of a program sponsored by the A. S. M. E., three organizations have been carrying on researches to gather further information regarding the properties of steam. The Harvard Engineering School is investigating the Joule-Thomson cooling effect in superheated steam at pressures up to 600 lb. and at temperatures up to 600 deg. F. The Massachusetts Institute of Technology has been determining the pressure-temperature-volume relation of superheated steam at high pressures and over as wide a range of superheats as possible. The United States Bureau of Standards has been determining the specific heat of water for a more accurate determination of the mechanical equivalent of the mean heat unit. Reports and comments of progress are reviewed in this article.—*Mechanical Engineering*, March, 1923.

*Combustion Control for Steam Boilers.*—C. H. SMOOT.—The author has presented a clear picture of what happens when burning coal on a grate and the reasons for the difference in the thickness of the fuel bed required when burning different kinds of coal. —*Power*, March 6, 1923.

*Leicester Central Generating Station.* —L. C. KEMP.—A twenty-page article describing and illustrating the construction and arrangement of equipment in the central station being built at Leicester, England. The initial installation is for 10,000 kw. with provisions for an ultimate extension to a total capacity of 60,000 kw. to 100,000 kw. The author describes the buildings and foundations, the coal and ash handling plant, boiler house and engine room, switchgear and transformers.—*English Electric Journal*, Vol. 2, No. 3.

## Generation, Control, Switching and Protection

*Compression Chambers on Automatic Oil Circuit Breakers.* — O. L'EPLATTENIER.—The author regards the following as the essential facts for calculating compression chambers on oil circuit breakers of high interrupting capacity: The rupture of the arc must completely take place in the inside of the compression chamber, therefore it must be made big enough to allow room for the contacts when open. The chamber must be perfectly insulated, fireproof and able to stand high pressures. Studying the general equation of an arc and the gases evolved by the action of the arc on the oil during and after the opening of the contacts, the author explains how to determine with accuracy the conditions of maximum efficiency under which chambers of compression or explosion are to be built.—*Elettrotecnica*, Feb. 25, 1923.

*Parallel Operation of Direct-Current Generators.* — SCOTT HANCOCK.—There are three considerations of fundamental importance in paralleling compound generators: (1) They must have drooping voltage characteristics. Compound machines usually have rising characteristics at their terminals, and it is this consideration which requires the use of an equalizer. (2) They must have the same voltage at no load and at some other point, usually full load. This characteristic—obtained by shunting one or more series fields—seems to be generally understood. (3) The resistances of the series field circuits from the equalizer to the busbar must be inversely proportional to the current rating. This is the consideration which is usually neglected and hence causes most of the trouble. These general considerations, including the special case of generators too far apart to use an equalizer, as in railway substations, are analyzed in detail by the author.—*Electric Journal*, March, 1923.

*Rating of Cables for Intermittent or Fluctuating Loads.*—S. W. MELSOM and H. C. BOOTH.—The extent to which the rating of a cable is affected by an intermittent or fluctuating load as compared with continuous running conditions is investigated theoretically, and formulas are given by means of which the effect of any type of loading can be calculated. It is shown by experimental determinations on various sizes and types of cables that the thermal time constant can be calculated either from a heating or cooling curve of a particular cable or from the specific heat and mass of the various components of the cable. Tables are given showing the rating for the cables for which load tables are given in the I. E. E. Wiring Rules, on the same basis as for motors, i.e. half-hour and hour ratings.—*Journal of Institution of (British) Electrical Engineers*, March, 1923.

## Transmission, Substations and Distribution

*Wooden Poles of Very Long Life.*—A. VAUPEL.—A German firm produces a wooden pole for which a useful life of thirty-three years is claimed. The pole consists of a tar-oil-impregnated hardwood lower part to which is clamped, about a yard above the ground, a "kyanized" soft-wood pole. Three or four very heavy and rust-proofed steel clamps, each a yard long, connect the two pole pieces. A large number of small bolts instead of a few heavy ones are used in the clamps to avoid any splitting of the wood. A pole of this construction is claimed to be absolutely safe against breakage. If stressed beyond its elastic limit the pole will bend rather than break. The results of a number of comparative stability tests of ordinary poles and the new poles are given, showing decided mechanical superiority for the latter. A cost comparison between plain "kyanized" poles of sixteen and one-half years' average life and the new poles of thirty-three years' life gives a saving of more than 34 per cent in favor of the new poles.—*Elektrotechnische Zeitschrift*, March 1, 1923.

*Inductance on Transmission Lines.*—A. DE MARCHI.—The author presents a chart for determining the inductance on transmission lines. Inductance, length of conductors, distance between conductors and their radius are given independently, so that no calculations are required. This chart is simple, clear and easily constructed.—*Elettrotecnica*, March 5, 1923.

## Units, Measurements and Instruments

*Radial Voltage Coil in Induction Meters.*—E. EVANS.—To obtain an exact 90-deg. phase displacement between the current and the voltage coil in induction meters for alternating current many very ingenious but more or less complicated methods have been used and are still in use where the iron core of the voltage coil is in a tangential position with regard to the running disk. The author shows in this paper that practically all of these difficulties may be successfully overcome by swinging the voltage magnet 90 deg. around so that it will stand radially against the disk. Such a meter, with the current magnet under the disk and its two poles tangential with the disk, was first introduced by the Bergmann concern and was later adopted by several other European manufacturers. By proper dimensioning of iron and copper a torque of 5 gram.-cm. and more may be reached easily.—*Elektrotechnische Zeitschrift*, Feb. 22, 1923.

*Electron-Tube Tuning-Fork Drive.*—E. A. ECKHARDT, J. C. KARCHER and M. KEISER.—Several methods for maintaining tuning-fork vibrations electrically without circuit interruptions by means of electron-tube circuits have been in use. In this paper the authors describe apparatus and circuit arrangements which have been found advantageous. To date the electron-tube drive has been applied to a large number of forks with frequency range from 50 cycles to 2,000 cycles.—*Journal of the Optical Society of America and Review of Scientific Instruments*, Vol. VI, No. 9.

*Obtaining an Indication of Transformer Temperatures.*—J. B. GIBBS.—Measurements by thermometers placed in oil, the difference in temperature between the oil and the windings and the use of heating coils for determining

the winding temperature are the subjects discussed in this article.—*Power*, March 6, 1923.

### Motors and Control

*The Textile Industry.*—The Feb. 23 issue of the *Electrician* is given over almost entirely to the progress made in textile-mill drive. Among the more important articles are: "Electrical Operation and Control of Textile Machinery and Processes" by Frank Nasmith, "The Conversion of Spinning and Weaving Mills from Steam to Electric Drive" by V. Mallalieu, "The War and the Textile Industry," "A Description of an All-Electric Textile Mill," "Electricity and Its Effect on Textile Industry," "Group Drive in a Lancashire Mill" and "Textile Drives" and "Motor Design."—*Electrician*, Feb. 23, 1923.

*Application of Electricity to the Sugar Industry.*—The sugar industry within the past few years has been highly electrified. Steam turbines are used for power generation in some cases. In these cases non-condensing turbines are used, the low-pressure steam being used in the process work. In several of the recent refinery installations direct current has been used throughout. This enables the very accurate control of crushers and rolls. —*Electrical News*, March 1, 1923.

*Industrial-Plant Repair Shop.*—E. J. FORD.—A systematic schedule of inspection to detect motor and control trouble as soon as it develops and a well-equipped repair shop for handling the unavoidable breakdowns mean low operating costs and minimum loss of production through failure of power service. In this article details are given of the methods employed and the facilities available for the maintenance of electrical equipment in the twenty-nine departments of the Kewanee (Ill.) plant of the Walworth Manufacturing Company. Although ninety of the 238 motors are exposed to dust and steam and acid fumes, the care which they receive is so effective that not more than fifteen motors are rewound a year.—*Industrial Engineer*, March, 1923.

*Starting Direct-Current Motors.* — C. A. ARMSTRONG.—Two types of series-lockout contactors that are used on automatic motor starters are described and the operation of two controllers using these types of contactors is given in detail.—*Power*, March 13, 1923.

### Heat Application and Material Handling

*Graphite Welding Electrodes.*—S. L. WALWORTH.—The use of graphite electrodes for welding and cutting where the carbon arc was formerly employed is becoming increasingly popular. Owing to the slower vaporization of graphite by the arc much less carbon is carried into the weld when graphite electrodes are used. This produces a softer weld than is possible with amorphous carbon electrodes and one that more nearly approaches the composition and hardness of the parent metal. The accompanying table shows how the increased electrical conductivity allows much lighter current densities to be carried by the graphite electrodes without excessive heating. — *Journal of the American Welding Society*, March, 1923.

HIGH-CURRENT DENSITIES ALLOWABLE WITH GRAPHITE ELECTRODES

| Size Graphite Welding Electrode, In. | Current per Electrode, Amp. | Curent Density, Amp. per Sq.In |
|---|---|---|
| 1/4 | 130 to 250 | 2,650 to 5,000 |
| 3/8 | 185 to 270 | 1,870 to 2,700 |
| 1/2 | 260 to 440 | 1,320 to 2,200 |
| 5/8 | 340 to 560 | 1,100 to 1,800 |
| 3/4 | 410 to 660 | 930 to 1,500 |
| 7/8 | 500 to 850 | 830 to 1,400 |
| 1 | 600 to 1,000 | 760 to 1,250 |

### Electrochemistry, Electrophysics and Batteries

*Manufacture of Chemicals by Electrolysis.*—A. CLARKE.—The main types of cells used in the electrolysis of alkali chlorides are the fused electrolyte cell, the porous diaphragm cell, the bell cell and the mercury cell. High degree of purity, high efficiency, absence of complicated side reactions, etc., are the advantages claimed for electro-organic chemical manufacture. The author deals with the use of electro-organic methods for the elimination of the catalyzers, such as the expensive arc oxides of the heavy metals for oxidation and reduction. A description is given of the more important commercial cells that are on the market for the production of alkali chlorides by electrolysis.—*Beama*, March, 1923.

### Telegraphy, Telephony, Radio and Signals

*Power-Circuit Interference with Telephone and Telegraph Lines.* — S. G. BARTHOLOMEW.—The author points out that the very sensitive apparatus necessary to transmit and safely reproduce telegraphic signals or spoken words is easily deranged by extraneous influences. The losses due to leakage from power circuits cannot be afforded and the liability to these is considerable, especially when the lines are in proximity to traction circuits having an earth return. The effects of induction are still more serious, consisting principally of disturbing noises, which are sometimes so violent as to produce what is termed acoustic shock to an operator. Methods of eliminating these effects, the reduction of harmonics, transformer conditions and the resulting cost of interference are discussed.—*Electrician*, March 2, 1923.

*Stationary Waves on Open-Ended Solenoids.*—A. PRESS.—The problem of the coupling coil has received new importance physically because of its application to wireless signaling. The nodal-point distribution on an elongated Tesla coil was recently investigated and it was found that the nodal distances fell off in value as the ends of the coil were approached. This attenuation of distance had been attributed to end effects, but it is shown by the author that the cause is rather a body effect.—*Journal of Institution of (British) Electrical Engineers*, March, 1923.

*Signal Maintenance on an Oregon Railway.*—H. J. CHARTERS.—The signaling equipment on the lines of the Portland Railway, Light & Power Company at Porland, Ore., consists of ninety-one United States type "G-1" non-car-counting block signals, 142 automatic signals for protecting spring switch points, fourteen terminal signals for stub-end city car lines, seven train order boards, four crossing bells and two special light signals for indicating operation over bridges. Excellent results are being obtained by systematic inspection and repair work which cover all the devices of a warning character used to protect patrons and expedite operation.—*Electric Railway Journal*, March 17, 1923.

### Traction

*Diesel-Electric Rail Motor Car.*—Following the experiments with a direct-driven Diesel locomotive on the Prussian State Railways in 1913, orders were placed for five self-propelled rail cars to be driven by Diesel engines coupled to electric generators with electric motors geared to the driving axles. As the war interfered, the locomotives that had been built were taken back and new engines installed. A general description of the locomotives, including the engines, generators, motors and electrical equipment and control, is given. Brief operating results are described.—*Railway Electrical Engineer*, March, 1923.

*Equipment and Operation of Railway Workshops.* — G. A. GUTHRIE — The author gives a description of the steel foundry in the South African railway workshops at Pretoria. He points out how the equipment and operation of these shops increased the efficiency of the company. — *Journal of the South African Institution of Engineers*, February, 1923.

### Miscellaneous

*Vectorial Addition of Complex Quantities.* — VLADIMIR KARAPETOFF. — A kinematic device is described which permits the performance, graphically and without computations, of the following operations on complex quantities: Additions, obtaining of reciprocals and conversion from the polar into the orthogonal form, or vice versa. The device makes it possible to solve in a simple manner alternating-current problems involving impedances in series and in parallel. An illustration is given of the predetermination of the performance characteristics of an induction motor in accordance with the exact theory of this machine. It can also be used for the predetermination of performance characteristics of transformers, transmission lines, etc. The name that the author has given to the device is "CPS'er," after C. P. Steinmetz.—*Sibley Journal of Engineering*, March, 1923.

# Scientific and Industrial Research

A Department Devoted to Reports of Investigations Contemplated or Completed, Research Facilities Available and Suggestions for Co-operative Work

*Conducted by* PROF. VLADIMIR KARAPETOFF, *Cornell University, Ithaca, N. Y.*

[ PRINTED IN THE THIRD ISSUE OF EACH MONTH ]

[When investigations which have been completed are, in the opinion of the editors, of wide enough interest to the field we serve, details thereof will be presented in other parts of this paper. Contemplated research or that which appears to have limited appeal will be only briefly reported in this section, but details may be had by communicating with the investigator or institution named in the report. Readers are referred to the department "Digest of Electrical Literature" for investigations reported in other journals. The news and engineering sections should also be followed for research reported before technical societies.]

## Research Completed

### Fuses for Potential Transformers, Wire Resistors for

Tests have been made on wire resistances of about 60 ohms in series with 13,200-volt cartridge fuses for potential transformers. Such resistors limit the violence of a dead short-circuit on the high-tension side of the transformer and prevent the fuse from being blown to pieces or torn from its clips. Moreover, without such resistors the recovery voltage after a short circuit shows a very prominent high-frequency over-potential, while with the resistors the recovery is almost normal. The ratio error due to such resistors is negligible. Carborundum rods of about 200 ohms resistance broke under sustained short circuit and their use is not recommended.—*A. F. Bang, Pennsylvania Water & Power Company, Baltimore, Md.*

### Instruments, Graphic, for Recording Troubles

In co-operation with the engineers of one of the largest power companies in this country, recording instruments have been developed which operate at a low chart speed ordinarily, but in which the speed rises up to sixty times normal feed whenever a disturbance occurs. An electromagnet is controlled by an overload relay in the power circuit, so that the instant the current rises to an abnormal value, the wattmeter, the voltmeter, the ammeter and the power-factor meter begin to record at the increased chart speed.—*J. W. Esterline, Indianapolis, Ind.*

### Oscillograph Timer for Transient Phenomena

An attachment has been developed which permits the repetition of transient electrical phenomena a desired number of times per second, say ten. In this manner a steady image of the repeated phenomenon can be observed on the oscillograph screen. Then it can be recorded photographically on the film, if so desired. Thus it is possible to observe or to adjust a periodic transient phenomenon before actually photographing it. The device consists of a drum with suitable contacts, driven by a synchronous motor. The same arrangement can be also used with an indicating ammeter or voltmeter, thus making it possible to read directly the effective value of current or voltage of a repeated transient.—*H. M. Turner, Yale University, New Haven.* [This extension of the oscillograph field should prove to be of considerable interest in the study of transient phenomena, especially where they can be repeated at a rate sufficient to give a continuous impression.—EDITOR.]

### Paints for Concrete and Metal Surfaces

A series of tests on concrete paints has been completed during the year. Exposure panels of concrete were painted with samples of paints submitted by manufacturers, placed on the roof of the laboratory and examined periodically. It was found that very few of these paints were giving satisfactory protection at the end of the first six months. Those which were satisfactory at the end of six months are still satisfactory after a year and a half. A similar series of tests is now under way for paints on structural steel, and a series has just been started on paints for galvanized metallic surfaces.—*Hydro-Electric Power Commission of Ontario, Toronto.*

### Poles of "Centrifugated" Reinforced Concrete

Constructed by winding around a long, slightly coned temporary wooden core a spiral of iron, upon which is disposed the light steel skeleton around which again is wound a double steel spiral. After removal of the wooden core the skeleton is put into a divided wooden mold, which is then filled to about one-third with the concrete mixture. The mold is contained in a cage of angle irons and steel disks, which rotates at first at 600, rising to 1,000 r.p.m. for about ten minutes in a special machine. By centrifugal action the concrete mixture distributes itself into a cylindrical mass throughout the steel skeleton. In an actual test a 10.35-m. pole, rated for 350 kg. stress at top, broke with 2,000 kg. after deflecting 1.1 m.—*C. Zorzi (from Elettrotecnica).*

### Power Plants, Remote Control of

There are cases where it is desirable to open and close switches and to determine conditions of operation of a power plant or substation from a distance. This is now possible by means of remote supervisory control of a number of stations along a single pair of telephone lines, utilizing the principles of the automatic telephone. A load dispatcher, located at the most convenient point, may in this way supervise and control the operation of a considerable group of stations, starting and stopping generators, closing or opening circuit breakers and obtaining other desired indication by either audible or visual signals. The same pair of telephone lines can be used for conversations.—*J. L. McCoy, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.* [This is an arrangement intermediate between the full automatic and the manual control of power machinery. Incidentally, this is a new and useful application of the automatic telephone principle, probably not foreseen by the original inventors.—EDITOR.]

### Thermostatic Relay Switch

In order to use a low-voltage source of power in the thermostat itself and a 110-volt or 220-volt source in the solenoid of the main switch which controls the temperature, a selective relay has been devised on a new principle. The arrangement is suitable for automatic oil burners, electric refrigerating machinery, electric heating units and similar equipment where it is necessary to operate an electric switch in accordance with temperature changes.—*Minneapolis Heat Regulator Company, Minneapolis, Minn.*

## In Progress or Purposed

### Cables, Power, Tests with High-Tension Direct Current

Before the use of direct current for this purpose can be considered successful the proper ratio between direct-current volts and alternating-current volts, to obtain the same results, should be definitely known. Foreign investigations indicate that this ratio should be about 2.5, but the American manufacturers up to the present writing have not been willing to agree to a ratio higher than 1.5. If the ratio of 2.5 is correct, then a test made with the direct-current voltage limited by a ratio of 1.5 will be entirely without value, as it is not enough above the normal operating voltage to give results that are at all comparable with those heretofore obtained with alternating current. Two of the cable-manufacturing companies have undertaken to make tests of this character, and results should be available very shortly.—*A. I. E. E. Committee on Transmission and Distribution.*

### Cables, Soil Temperature Measurement for

To determine the basic temperature for the calculation of the current-carrying capacity of underground cables, soil temperatures are being taken 18, 27 and 36 in. below an asphalt-covered street in Washington, D. C. These measurements have been made every three hours since July 1, 1922, and will be continued until July 1, 1923, in order that they may embrace all seasonal changes.—*A. Smirnoff, Potomac Electric Power Company, Washington, D. C.*

### Circuit Breakers, Non-Oil-Throwing

These breakers are provided with explosion chambers and with separating chambers. The operating mechanism is underneath the cover of the breaker. When the breaker is opened under load the arc is interrupted in the lower part of the oil tank. The gas that is generated passes upward, mixed with some oil, through the center hole in the lower baffle, and the gas and oil are partially separate while passing through the upper baffles. They are finally carried to the separating chamber, where complete separation of the gas and oil and cooling of the gas take place. The oil then returns to the tank.—*General Electric Company, Schenectady, N. Y.*

### Lightning Arresters, Classification of

A classification of lightning arresters is being planned which will make a more complete comparison of the available types possible and will give operating engineers a better basis for choosing proper arresters for different lines. For the main subdivisions of such a classification see the *A. I. E. E. Journal*, November, 1922, Vol. 41, page 897.—*A. I. E. E. Sub-Committee on Lightning Arresters.*

### Transformer Temperature

It is proposed to make a study during the coming year of transformer temperature and possible allowance of overload, together with the duration of such overload for urban and rural service.—*Overhead Systems Committee of Great Lakes Division, N. E. L. A.*

## Suggestions for Research

### Cables, Determination of Faults in

There is apparently a demand among the central stations for an accurate and ready means of determining the character and extent of faults in cables, and after the fault has been determined by measurement, there is need of some apparatus, preferably portable, which will localize the fault.—*F. V. Magalhaes, New York City.*

### Heat Transmission

The division of engineering, with the co-operation of the division of physical sciences, is organizing a committee and developing a program for an investigation in heat transmission. Important fundamental and industrial problems exist in heating and ventilating of dwellings and workplaces, refrigeration, steam engineering, metallurgy, chemical processes, expansion and contraction of structures. At present there is need for information on the heat conductivity of many materials.—*National Research Council, Washington, D. C.*

### Photo-Electric Cells

Photo-electric cells are beginning to be used in some practical applications in place of the human eye, for example in photometry, in sorting objects according to their shade of color, in closing contacts, etc. The present cells are rather delicate and do not possess the required constancy of characteristics. It is desired to develop them into a practical piece of apparatus suitable for use in places where they do not get the same expert care as they would in a physical laboratory.

### Transmission Lines, No-Load Losses in

It would be of interest to operating engineers to know whether the no-load losses in a transmission line consist only of the $I^2R$ and corona loss, or whether there may not also be inductive earth losses of a magnitude that should not be neglected, since they probably increase at least with the square of the voltage. These losses would also occur with the line loaded, but might not be easily measured.—*R. J. C. Wood, Los Angeles, Cal.*

# News of the Industry

**Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men**

## News from the Capital

**Reports on Susquehanna Projects and Other Matters Gleaned from Official Sources**

A PLAN to install 360,000 hp.—an installation greater than that on the American side at Niagara Falls—on the Susquehanna River is revealed by an application which has been filed with the Federal Power Commission by the Susquehanna Power Company of New York. The proposed development is to be at Conowingo, Md. It is the intention to construct a dam 100 ft. high, which will create slack water for 25 miles to McCall's Ferry at Holtwood, Pa. The Susquehanna Power Company already has acquired nearly all the flowage rights needed for the project and has made extended engineering studies. Further investigation, however, is planned. It is understood that Philadelphia interests are behind the undertaking. In proposing the installation of equipment sufficient to generate 360,000 hp. the company has in mind furnishing large blocks of power for use in Philadelphia and Baltimore.

It also is reported that the Pennsylvania Water & Power Company has in mind the development of the power immediately above its Holtwood plant. Such a plan would develop slack water in the Susquehanna from tidewater to the vicinity of Harrisburg and would pave the way for the utilization of these pools by a navigation project.

ALABAMA POWER'S GROWING LOAD

The Alabama Power Company has applied to the Federal Power Commission for a license covering the installation of a 5,000-hp. unit in Government Dam No. 17, on the Black Warrior River. Right to install a similar unit at Dam No. 16 will be asked in the near future. The growth of the Alabama Power Company's load has been so marked in recent months that these small developments are being seized upon in an effort to keep abreast with the demand for power. The company on April 7 put into service the first unit at its development at Duncan's Riffle on the Coosa River. Two additional units of that plant are to be installed with all possible expedition. In addition the company is pressing its investigations on the Tallapoosa River in the hope of developing at the earliest possible time the large power resources of that stream.

Since Congress has been unwilling to appropriate funds for the employment of an adequate personnel to attempt the determination of fair values covering actual investments on the part of licensees in water-power projects, a suggestion has been made that the investment in such works can be verified by inserting a provision in each license requiring the licensee to pay for the service of an inspector to check up items entering into the capital investment. This plan would provide funds in an indirect way for carrying out that part of the work. The proposal has not, however, been officially brought to the attention of the Federal Power Commission, and it is not known how that body would look upon such an expedient.

COLORADO DISCUSSION POSTPONED

Discussion of the Colorado River situation by the Federal Power Commission, which was to have taken place on April 18, was advanced until April 19.

## Highest Court Finds Against New York Commission

The United States District Court for Southern New York had full authority to grant an injunction to the New York Telephone Company against the Public Service Commission to enjoin temporary exchange rates ordered last year by the commission, and the temporary rates were too low to bring a reasonable return on the value of the company's property. This is the main purport of a decision of the United States Supreme Court rendered April 16. The court finds that under the New York commission law the telephone company was not obliged to ask the commission for a rehearing and then appeal to the state courts before taking the case to the federal tribunal, but had a right to immediate appeal on the ground that the temporary rates prescribed were confiscatory.

The New York Public Service Commission started an investigation of telephone rates on March 3, 1922, and before it was completed issued orders reducing rates temporarily, pending final determination, one schedule of maximum rates being fixed for New York City and other schedules for the remainder of the state. The company obtained an injunction in the district court, and the commission appealed to the United States Supreme Court. After the argument the commission fixed new and permanent rates, which, according to the company, will grant a higher return than the temporary rates would have done. These are left undisturbed.

## Deadlock Likely at Albany

**Small Prospect of Agreement Between Senate and House on Public Utility Legislation**

THE legislative session at Albany, N. Y., is drawing to a close with the Senate and Assembly at loggerheads over the passage of the public utility legislation introduced by the Democrats. While the Republican Assembly is willing to afford some measure of home rule to New York City in the matter of regulation of its transit facilities and to amend the Public Service Commission law by taking away the right of the commission to increase a fare, rate or charge regardless of the existence of a franchise agreement, contract or special or general law to the contrary, it will not adopt the radical measures proposed by the Democratic administration.

A bill introduced into the House by Assemblyman Jesse of New York, which is likely to pass that chamber, leaves the personnel and manner of appointment of the commission unchanged, but deprives it of the power to fix temporary rates while they await final determination or to increase rates over those specified in contracts, though it is permitted to lower them at will.

Governor Smith's water-power bill calling for state development and ownership passed the Senate on Tuesday by a vote of twenty-seven to twenty-two.

## Water-Power Situation in Pennsylvania

Uncertainty as to the water-power legislation which the Pennsylvania Legislature may adopt is delaying proposed developments in that state. Since Governor Pinchot brought forward his water-power bill not a single charter has been granted at Harrisburg covering a power project. It is the Governor's idea to bring intrastate water-power development under virtually the same restrictions as are imposed by the federal water-power act on the development of power on navigable waterways.

## Nebraska May Acquire Hydro-Electric Sites

A resolution has been introduced into the Legislature of Nebraska at the instance of Governor Bryan which provides for a general vote in November, 1924, upon an amendment to the state constitution permitting the state to "establish, maintain, acquire, convert and develop hydro-electric and other power

sites and plants, sand, cement, limestone beds for building material and other natural resources beneficial to the state." The resolution was sent to a committee by the House of Representatives on April 10.

The Nebraska House earlier in the session passed a resolution asking Henry Ford to survey the power sites of the state with the view of engaging in their development.

## Big Susquehanna Plant

**Metropolitan Power Company Organized to Build Station with Ultimate Rating of 200,000 Kw.**

THE Metropolitan Power Company is being incorporated under the laws of Pennsylvania to build and operate a large steam-electric power generating plant at Middletown, Pa., on the Susquehanna River. The initial capacity of the plant will be 30,000 kw., but it will be designed for extension to an ultimate capacity of 200,000 kw. The entire power generated in the plant will be sold to the Metropolitan Edison Company, which will then be in a strong position to meet the demand for electric power and lighting service in the extensive industrial district of Reading, Lebanon and sections in the vicinity of Middletown and Steelton. The Metropolitan Edison Company will be enabled to use this steam power in conjunction with the full capacity of the present hydro-electric power station of the York Haven Water & Power Company, which it controls.

Provision was made so that prior to the company being incorporated a well-adapted site could be acquired for the plant and borings for the foundations started. A contract for a 30,000-kw. turbine-generator, together with boilers and accessories, has already been made, and delivery will be during the early part of 1924. In the meanwhile the buildings, condensing facilities, coal storage, railway terminals, etc., will be completed, ready for the machinery, so that the station should be in operation not later than the middle of 1924.

The plant of the Metropolitan Power Company will be connected by 110,000-volt tower transmission lines with the present large generating plant of the Metropolitan Edison Company at Reading, which is now being connected by 110,000-volt tower transmission lines with the system of the Pennsylvania Edison Company, supplying the territory in Easton and adjacent territory. A large generating station at Holland now being erected by the New Jersey Power Corporation will be connected in to the Reading-Easton transmission line as well as to the system of the New Jersey Power & Light Company, which supplies territory in New Jersey from a point within 30 miles of New York City to the Delaware River and as far north as the New York State line. These transmission lines will form a system to which 90,000 kw. of new capacity will be connected in the near future.

## New Central Station for "Tri-Cities"

The erection of a new central station on the Mississippi to serve the "Tri-Cities" (Davenport, Iowa, and Rock Island and Moline, Ill.) and surrounding territory is now being planned by the United Light & Railways Company, Grand Rapids, Mich. The site has not yet been selected, but a 20,000-kw. turbine-generator has been ordered by the Moline-Rock Island Manufacturing Company, which supplies power to the other subsidiaries of the United Light & Railways Company in that territory. Delivery of the unit is to be made in March of next year. Powdered fuel may be used. The total cost of the projected station is put at $1,750,000.

The new turbine unit will be designed to operate on 350 lb. steam pressure, 250 deg. superheat and 29 in. vacuum referred to a 30-in. barometer. The generator will be designed for 20,000 kw., 80 per cent power factor, and will be wound for 13,200 volts, three-phase, 60 cycles. It will be equipped with a direct-connected exciter wound for 250 volts.

## Charleston, S. C., Seeks Development of Santee Power

An effort is on foot, backed by strong local public sentiment, looking to the development of a 37,500-hp. project in the vicinity of Charleston, S. C. The Columbia Railway & Navigation Company proposes to construct a canal from the Santee River at a point near Ferguson to the Cooper River at a point near Monck's Corner. In that way a head of 55 ft. can be developed. The project also involves the use for storage purposes of 20,000 acres of land which is not being used otherwise. It will provide a navigation channel direct from Charleston to Columbia via the Congaree River. Such a canal existed in the past. The feasibility of the project depends on the amount of water which the federal government will authorize the applicant to divert from the Santee River.

## St. Maurice Company Orders Propeller-Type Turbines

A contract for four propeller-type turbines of 30,000 hp. each for the new hydro-electric plant of the St. Maurice Power Company on the St. Maurice River, Quebec, has just been placed with the Dominion Engineering Works, Canadian licensees of the I. P. Morris Department of the William Cramp & Sons Ship & Engine Building Company of Philadelphia. These turbines, when completed, will be the highest-powered propeller-type turbines in the world, exceeding in unit capacity those built recently by the same firm for the Manitoba Power Company at Winnipeg. They will operate under a head of 60 ft. at 130 r.p.m. The Westinghouse Electric & Manufacturing Company is to furnish the electrical equipment.

The St. Maurice River Power Company is a subsidiary of the Shawinigan Water & Power Company, which already has two large developments on the river. The new station is at Gres Falls, 10 miles below the Shawinigan Falls station and about 20 miles below the Laurentide plant. When it is completed its rating of 120,000 hp. will raise the total amount of hydro-electricity developed on the St. Maurice to more than 500,000 hp.

## Thomson Visits General Electric Laboratories

BEFORE returning to England, Sir Joseph J. Thomson, the master of Trinity College, Cambridge University, who has world-wide fame as an electrophysicist, visited the General Electric Company's laboratories at Schenectady, N. Y. He is here shown with Dr. Irving Langmuir, assistant director of the laboratories; Dr. R. B. Owens, secretary of the Franklin Institute; W. C. L. Eglin, vice-president of the Franklin Institute, and Dr. W. D. Coolidge, inventor of the Coolidge X-ray tube. He is seen examining a 20-kw. radio tube.

## Electric Steel Researchers Hold Convention

The Electric Steel Founders' Research Group held a convention at East Aurora, N. Y., on April 13 and 14, at which twenty-six representatives of the five electric steel casting plants forming the group joined in a discussion of important steel-foundry problems. W. H. Worrilow, president of the Lebanon Steel Foundry, Lebanon, Pa., presided. Papers on "Electric Steel Castings for Specialties," by W. J. Nugent, Chicago, and "Properties of Electric Steel Castings and Where They Should Be Used," by T. S. Quinn, Lebanon, were read. W. J. Corbett spoke on new uses for electric steel castings, explaining that some users of metal parts have not yet realized that steel castings having thin sections can be made by the electric process with considerable reduction in weight and economy in machining and assembling the castings.

## Last Chance to Take Course in Industrial Heating

In order that central-station sales engineers may have a final opportunity to take one of the industrial electric heating courses which were so successfully given last year under the auspices of the National Electric Light Association, arrangements have been made for one more course in 1923, under the supervision of the industrial electric heating division of the association. V. M. F. Tallman, of Charles H. Tenney & Company, Boston, Mass., who is vice-chairman of the Power Sales Bureau of the association, is in charge of enrollment.

The course will be held May 14 to 26 inclusive, the General Electric and the Westinghouse company giving parallel instruction during this period. The General Electric course will start at Schenectady, N. Y., and be completed at Pittsfield, Mass., and the Westinghouse course will begin at Mansfield, Ohio, include Pittsburgh, Pa., and be completed at Newark, N. J.

## P. G. & E. to Increase Water Storage at Bear River

The contemplated increase of the storage at Lake Fordyce on the South Yuba-Bear River development and improvements in the Drum power system have been announced by the Pacific Gas & Electric Company. The present 90-ft. dam at Lake Fordyce will be raised 47 ft., increasing the storage from 20,000 acre-ft. to 47,000 acre-ft. Two seasons will be required for this work.

Improvement work on the canal carrying the water to the Drum power house will be undertaken soon. The alignment will be rectified in places, detours of construction eliminated and leakage corrected. A second penstock is to be laid down the 1,375-ft. drop to the Drum power house in order that full load may be carried on the generators, making Drum the "peaking" plant of the system. An afterbay will be built in Bear River gorge half a mile below Drum in order to utilize the water from the plant's "peaking" operations.

## Operation the Keynote

### Pittsburgh Convention of Institute Will Be Devoted Mainly to This Phase

THE program of the meeting of the American Institute of Electrical Engineers to be held in Pittsburgh on April 24-26 (see ELECTRICAL WORLD for March 31, page 767) shows that the local section through its convention committee has well sustained the reputation of Pittsburgh for unostentatious accomplishment. The large attendance that is expected will be rewarded by the operating papers filled with definite data and practical conclusions that are to be presented on subjects of vital interest to the electrical industry.

The midwinter convention in New York presented the accomplishments of the electrical specialists. At Pittsburgh the operating specialists will be heard. Experiences with reactors, relays, grounded systems, surges, Peterson coils, arcing grounds, lightning disturbances and insulators on systems like those of the Public Service Electric Company, the Philadelphia Electric Company, the Alabama Power Company and the Duquesne Light Company will be described for the benefit of the industry. Another notable paper will be presented showing the performance of a good oil-burning locomotive in a series of tests on the Southern Pacific system. These tests are of a character to give real opportunity for accurate analyses of railroad electrification projects.

No convention of electrical engineers could well be held in Pittsburgh without papers on electric furnaces, and at the coming convention splendid papers will be presented on this subject by men who know it from the operating standpoint.

There is a place for discussion of every electrical engineering accomplishment in the Institute, and the Pittsburgh meeting appears to be particularly well suited to the operating group connected with central stations and industrial establishments. In addition to the convention itself, the Pittsburgh district, of course, contains actual engineering installations and developments that will afford instructive and interesting material to the delegates and visitors.

## Del Monte A. I. E. E. Convention Postponed

The date for the Pacific Coast convention of the American Institute of Electrical Engineers, to be held at Del Monte, Cal., heretofore announced as Sept. 25-28, has been changed to one week later, and the meeting will therefore be held from Oct. 2 to Oct. 5.

## State Ownership Failure in Europe, Says Barnes

Julius H. Barnes, president of the Chamber of Commerce of the United States, who recently returned from an extended trip in Europe, told his observations on the economic condition there at a dinner given in New York on Monday night. After telling of the return by the Italian government of the parcel-post system and the telephone to private hands and discussing general politico-commercial conditions in Europe, which he found improving in many countries, Mr. Barnes said:

"The outstanding fact which impressed us in all these countries in Europe is the very clear conviction that state ownership and state operation of public facilities—I won't say public utilities, but public facilities—has distinctly written itself as a failure. Not only is this shown in Italy's effort to get all its public state-owned facilities in private hands, but it is shown in Austria, where there is a recasting of the government railroad service and a discharge of 100,000 superfluous employees. It is shown in Great Britain, where the railroads under their return to private operation have greatly quickened the business and economic life of that island and greatly improved the service and at the same time reduced the rates. There is a general appreciation throughout all of Europe that these facilities must not only be in private hands but they must be regulated so wisely that they will present a field of attraction for the superior grade of private ability to enlist itself in their administration, and it is true that where this has been tried, as in Great Britain, they are meeting with satisfactory results."

## Anomalous Utility Situation in Menominee

A discontinuance of electric light and power service, as well as of electric railway operation and gas supply, may be the outcome of the situation in Menominee, Mich., which has been supplied with electrical energy for two years by the Menominee & Marinette Light & Traction Company without this company possessing a franchise or having authorization from the Public Service Commission. When its electric light and power franchise expired in March, 1921, the company continued to furnish electricity. Lately its two other utility franchises expired, and the Aldermen have prepared new contracts which the company thinks unfair. A threat to make the latter remove its wires from the streets and alleys of the city has been made.

Objectionable features contained in the terms of the new franchise, as enumerated by J. P. Pulliam, vice-president and general manager of the Menominee & Marinette Light & Traction Company, include the requirement that the company shall put its hydro-electric plants outside the city limits under municipal control, including future im-

provements and additions; the clauses providing that no increase in rates agreed on with the city shall be binding for more than a year unless indorsed by a three-fifths popular vote, and that the City Council by a majority vote may rescind such increased rates after three years; the provision giving the city mandatory power to order extensions; the stipulation giving the city street commissioner authority to withhold approval of expenditures for equipment, extensions, salaries, etc., and the right given the city to dictate the compensation of directors and officers.

Mr. Pulliam, in making known the company's stand, announced that it stood ready to expend approximately a million dollars in Menominee in the next two years for improvements in its various utility properties.

# Functions of Trade Associations

### Vote Taken by Nearly Seventeen Hundred Bodies Composing United States Chamber of Commerce Reveals General Agreement on What These Should Be

APPROVAL of properly functioning trade associations for each important branch of industry and commerce in the country was voted by business organizations affiliated with the Chamber of Commerce of the United States in a preliminary referendum canvass held on April 13 last, results of which have just been announced by the national chamber. Eight separate propositions relative to the activities of trade associations were submitted, and the affirmative prevailed by very large majorities in every case, negative votes ranging from 5 to 282 in a total poll of nearly 1,700.

The propositions that carried are as follows:

"First—Because of numerous useful and important functions of obvious propriety trade associations should exist for each important branch of industry and commerce.

"Second—A trade association should have such a membership that it can be representative of the industry in connection with problems affecting the general advance of the industry.

"Third—A trade association should be prepared to consider all problems affecting the general advance of its industry or branch of commerce.

"Fourth—Trade associations should continue free from special forms of governmental control.

"Fifth—Statistics of capacity, production, stocks and sales should be collected by a trade association for its industry or branch of commerce.

"Sixth—Statistics of actual prices in closed transactions should be collected by a trade association for its industry or branch of commerce.

"Seventh—Any interpretation of statistics or other comment which could induce or facilitate concerted action on the part of members should be omitted by a trade association.

"Eighth—Statistics of capacity, production, stocks, sales and prices a trade association should make as available to the public and to government agencies interested in following the course of the industry and commerce as to members."

The largest negative vote was cast against the eighth proposition.

The propositions were taken from the report of the special committee created by action of the board of directors of the Chamber of Commerce of the United States in 1922 to "make a general survey of trade associations and consider activities of trade associations which are in the interest of the public and of the fields of enterprise which are represented." Philip H. Gadsden of Philadelphia, vice-president of the United Gas Improvement Company, headed the committee as chairman.

The committee expressed itself as of the opinion "that, while a minority of trade associations may have engaged in practices which have laid them open to complaint under the law with respect to restraints of trade, the vast majority have proved their great value for the advancement, day by day, of the processes of production and distribution."

#### VIEWS OF COMMITTEE

In expressing opposition to government control of trade associations, the committee said: "The possibility that a trade association may err by violating a statute no more justifies any attempt on the part of governmental authority to control trade associations in all their activities than the possibility of illegal acts on the part of individuals warrants like supervision over all their actions. Such supervision would inevitably restrict the freedom of action of trade associations in meeting the problems which they exist to solve."

The committee laid down as its recommendations three rules with relation to the statistical activities of trade associations, as follows: "(1) Reports of members to their association should be accurate and sufficiently complete to prevent misconstruction. (2) As distributed to the membership, the statistics should not be accompanied with any interpretation or other comment which could induce or facilitate concerted action on the part of members. (3) All statistics regarding prices should be confined to closed transactions and should not refer to pending transactions or future transactions."

Summarizing its conclusions, the committee said: "The committee believes that trustworthy information concerning capacity, production, stocks, sales and prices is essential to the effective operation of industry and trade under competitive conditions. The voluntary reporting of such information to trade associations and the subsequent publication and dissemination of such information in a manner which makes it available not only to contributors but also to consumers and to the public generally is beneficial alike to the field of business and the public and does not constitute a restraint of trade."

## Gift of £100,000 for Research in England

The gift of £100,000 to the Royal Society of Great Britain by Sir Alfred Yarrow, a prominent shipbuilder, is announced. The object of the donation is the same as that pursued in America by Ambrose Swazey, who gave $500,000 to make possible the organization of the Engineering Foundation—the "furtherance of research in science and engineering" and the "advancement in any other manner of the profession of engineering and the good of mankind."

"I have for many years," Sir Alfred Yarrow said in announcing his gift, "held the view that the prosperity of England has been greatly hampered in the past for the want of better promotion of scientific investigation and its application to practical affairs. I am convinced that the future prosperity of England will be largely dependent upon the encouragement of original scientific research. The birth of new industries and the development of existing ones are due largely to the growth of science, thus insuring employment and advancing the welfare of the whole community. It is doubtful whether even yet it has been realized how completely this country would have been at the mercy of our antagonists in the late war had it not been for the research work done by our scientific men before the war and during its course."

## America May Participate in World Power Conference

American technical and business associations have been invited to take part in the World Power Conference to be held in London, England, next year. Preliminary conferences have already been had in New York on the question of American participation, and the matter has been brought formally to the attention of all the national organizations in this country that are interested in the question of power. An organization meeting at which definite action will be taken is tentatively scheduled to be held in the Engineering Societies Building in New York on June 13. At that time a draft of a suggested organization will be presented. O. C. Merrill, executive secretary of the Federal Power Commission, has acted as chairman of the preliminary conferences, and J. W. Lieb of the New York Edison Company is chairman of the sub-committee on suggested organization.

The purpose of the World Power Conference, as expressed a year ago by its British promoters, is "to consider how the industrial and scientific sources of power may be adjusted nationally and internationally."

## Talk of New Niagara Pact

### Treaty with Canada Permitting Diversion of 80,000 Second-Feet Finds Favor

RAPIDLY increasing need for more diversion from the Niagara River for the use of the Queenston plant of the Ontario Hydro-Electric Commission is expected to result in stimulating Canada's interest in a new treaty. Two years ago, when the State Department suggested the advisability of discussing the matter of additional diversion, Canadian officials did not encourage the proposal. Since then, however, the situation has changed materially. The load furnished to customers on the American side has increased very materially. On the Canadian side there has been steady expansion of the distribution system until it reaches as far westward as Windsor, opposite Detroit. The demand has reached a point where additional diversion is absolutely essential to the most efficient operation of the plants of the Hydro-Electric Commission.

It can be stated most emphatically that no official on either side will consider any diversion which will detract from the scenic value of the Falls. A total diversion of 80,000 second-feet, proposed as the amount to be agreed upon in a new treaty, would, in the opinion of engineers, have no bearing on this.

The demand for additional diversion is even greater on the American side than in Canada. The Niagara Falls Power Company has been running at full capacity for eight months. By the time that the 100,000 hp. of additional power which is the net gain represented by the improvements under way is available next fall it will be absorbed immediately.

The hope is expressed in Washington that the new treaty can be confined to the power phase of the situation, leaving other matters, such as the diversion at Chicago, to be handled separately. No controversy is anticipated over the diversions for power purposes, but the other questions are likely to result in extended discussion.

## Arkansas Company to Push Caddo River Project

The Caddo River Power & Irrigation Company has, it is announced, been merged with the Arkansas Light & Power Company, which will undertake the hydro-electric power development on the Ouachita River near Hot Springs and Malvern for which financing and engineering plans have been completed. The Arkansas company already has constructed a 66,000-volt line from its Pine Bluff-North Little Rock-Malvern-Arkadelphia system to within a few miles of the sites for the first dam and power stations.

Permits covering three sites on the Ouachita have been obtained from the federal and state commissions, engineers estimating that a total of 120,000 hp. will be developed. The first dam and generating station will develop 15,000 hp. and will cost between $1,500,000 and $2,000,000. It has not been definitely determined whether the first dam will be constructed at what is known as the Remmel site, a few miles north of Malvern, or at the Hot Springs site, about 10 miles south of Hot Springs. Surveys and tests for foundations show that either site will be satisfactory. The development will create large lakes and will go far to prevent floods on the Ouachita River. The three dams and generating stations will entail an ultimate investment estimated at $15,000,000.

It is planned to have the first station in operation within fifteen months. Through the existing transmission line of the Arkansas Light & Power Company, the hydro-electric energy will be made available to Pine Bluff and twenty-two other cities and towns immediately upon completion of the water-power station, and but little construction is necessary to connect up all the lines of the company and make the power available to the numerous cities and towns served by this company.

# Commercial Questions Are Up at St. Louis

### Second Day's Sessions of Middle West Division, N. E. L. A., Cover Appliance Load, Highway Lighting, Electrical Homes, Rural Service, Interconnection and Other Topics

AN ENTHUSIASTIC discussion of the commercial side of the central-station industry marked the Thursday morning session of the convention of the Middle West Geographic Division of the National Electric Light Association, held at St. Louis last week, the opening sessions of which were reported in last week's ELECTRICAL WORLD.

#### NEW BUSINESS CHANCES

E. W. Lloyd spoke interestingly on the work of the Joint Committee for Business Development. He believed enough appliances could be sold to make the yearly residential revenue from this source alone equal that from residential lighting consumption. One of the difficulties in the sale of appliances, he indicated, was that too many central-station men are not convinced of their value and therefore are not in position to sell them successfully. He called attention to the possibilities of highway lighting as a means of protecting life and property as well as facilitating travel. Pointing to the lack of man power that is forcing industry to develop new methods of accomplishing tasks, he declared that here lies an opportunity for the central station in the development of new business. He spoke also of heat treating and melting of metals electrically, expressing the opinion that in a generation all melting of non-ferrous metals will be done electrically.

Electricity on the farm, railway electrification and other commercial possibilities were cited, Mr. Lloyd contending that the individual member companies of the N. E. L. A. are not giving enough time to the consideration of the commercial problems involved in all these uses of electrical energy. He made a plea that each company detail at least one man to devote time to the development of the commercial work of the association and asked that more and better men be constantly added to the committees of the Commercial Section.

F. S. Dewey of Kansas City told of the experience of the Kansas City Power & Light Company with its electrical home exhibit. Between 37,000 and 40,000 people passed through the home in four weeks. A force was organized to take the visitors through and explain all the features of lighting and domestic uses of electricity so that the service offered would be thoroughly impressed on them. Results of this work, he said, are constantly developing. Co-operation between the various branches of the electrical industry in Kansas City had shown that the misunderstandings and mutual criticisms that so often arise could readily be avoided.

He criticised the policy of employing salesmen who will not take the chance of losing business by telling the customer frankly when the results desired cannot be accomplished. Honesty in telling the customer exactly what can be done and expected, Mr. Dewey said, is one of the most important elements in the sale of electric appliances and devices.

N. T. Wilcox made a plea for more money to carry on the commercial work of the N. E. L. A.; J. L. Harvey of Wichita suggested highway lighting as one of the elements through which rural electric service can be developed, and O. H. Simonds of Dubuque, Iowa, asked for greater support of the national association.

#### BANQUET SPEECHES

At the banquet on Wednesday night President Frank W. Smith of the national association told of the arrangements for the coming convention in New York, asking the delegates to make special efforts to attend. Vice-president Davidson and Executive Manager Aylesworth also spoke, the latter expressing belief in merchandising by the central-station company and also the opinion that those central stations that have got out of the merchandising phase of the business will go back into it.

Martin J. Insull at the Thursday afternoon session dwelt upon the public's interest in public utilities and told the delegates that unfavorable public

opinion is largely due to the fact that the public is misinformed as to the affairs of the utilities.

Rural Service Problem Worldwide

J. C. Martin, Western editor of the Electrical World, discussed the rural electric service problem, saying that it is not purely an American or central-station problem but is a worldwide agricultural economic problem owing to the need of the farmer to improve his living conditions and lower his production costs by supplanting hand labor with machine work as has been done in other industries. The work of the newly organized committee of electrical and agricultural interests to study the problem was described. Austin Burt of Waterloo, Iowa, said that confidence between the central-station companies and the farmers is the foundation on which the solution of the problem must be based and that central-station men must seek to establish that confidence.

Steps were taken by the committee having in hand the survey of the interconnection problem in the Middle West Division states to co-ordinate its work with that of a similar committee in the Great Lakes Division. Some of the interconnections that may seem logical in the future are more or less divided between the territory of the two sections because of the location of the systems.

The officers of the division elected for the coming year are: President, L. O. Ripley, Kansas Gas & Electric Company; vice-presidents, H. C. Roberts, Union Power & Light Company, Omaha; H. C. Blackwell, Kansas City Power & Light Company, and B. J. Denman, Tri-City Railway & Light Company. Horace M. Davis of Lincoln, Neb., is the secretary-treasurer.

## Report of Cities Service Indicates Marked Progress

The pamphlet report of the Cities Service Company for 1922, which has just been issued, shows an increase in net earnings from $12,944,716 to $14,205,674. Preferred dividends of the company were earned 2.41 times against 2.23, and the earnings on the average amount of common stock outstanding during the year amounted to $14.88 a share, as compared with $13.04 a share in the preceding year. Gross earnings of the Cities Service Company in 1922 were $14,658,971, as compared with $13,461,770 in 1921.

The earnings of the public utility properties increased 20.65 per cent over the preceding year, or from $6,918,741 to $8,347,546. This was not only sufficient to pay all Cities Service Company interest charges and the preferred dividends, but showed a comfortable return on the outstanding common stock.

General business conditions, according to the report, have improved in almost every territory where Cities Service public utilities are operated. The demand for power and light is constantly increasing, and the company is doing what it can to increase its capacity to meet this demand. Extensive construction programs are in progress in Ohio, Colorado, Joplin and Sedalia, Mo., and Texas.

## New York City Has Novel Electric Sign

An electric sign of novel and artistic type has been erected along the canyon of white lights on Broadway, New York, to announce a popular motion-picture entitled "The Covered Wagon." The wagon and entire upper portion of the sign are lighted by ten 500-watt floodlamps, and on the front of the wagon is a lantern which is an exact facsimile of the type used in 1849. A lighting effect which simulates water running under the wagon is obtained by six stereopticons automatically operated by motors which turn a color wheel with water painted on it. Each lamp is a 2,000-watt nitrogen-filled unit specially made for stereopticon purposes. In the center of the water is a small sign in raised bronze letters reading "Paramount Pictures." These letters are set in a box flush with the water and are illuminated by indirect lighting which causes the letters to stand out as if they were set in the water.

Electrical Devices Cause the Water on This Sign to Flow

The sign was constructed and installed by the Norden Company, under the supervision of Mortimer Norden, the company's engineer.

## Earnings of Northern States Power Increase

The annual report for 1922 of the Northern States Power Company indicates that the gross earnings ($13,881,919) increased 7.09 per cent and the net earnings ($5,781,092) 11.01 per cent as compared with 1921. After payment of the fixed charges and the regular dividend on the preferred stock a balance of $1,628,126 was available for amortization, depreciation, common dividends and surplus. The report further considered the development of an additional hydro-electric plant on the St. Croix River and the new steam plant now under construction in St. Paul, which will have an ultimate capacity of 200,000 hp. During the year the company gained 4,494 stockholders and added forty-five additional communities to its transmission lines.

## Power Problems Will Occupy New England Division

Papers on power problems by leading engineers will characterize the annual meeting and Technical Section day of the New England Division, N. E. L. A., at the Hotel Biltmore, Providence, Friday, April 27, beginning at 10:30 a.m. Officers of the division will be elected for the coming year, in accordance with a recent constitutional amendment, and the following technical papers, with discussions, will be presented: "Pulverized Fuel," by R. E. Dillon, Boston; "Use of Three-Phase Versus Single-Phase Transformers for Power Loads," by W. P. Schwabe, Thompsonville, Conn.; "Power-Factor Correction," by F. L. Hunt, Greenfield, Mass., and "Development in Power Production," by Oscar Junggren, General Electric Company, Schenectady, N. Y. After the meeting it is expected that delegates and guests will have an opportunity to visit the new service station of the Narragansett Electric Lighting Company at Melrose.

## Electrical Men Represented in Arbitration Society

The Arbitration Society of America, which, under the presidency of Emerson McMillin, is endeavoring to become a "people's tribunal" to which disputants may submit any form of controversy for immediate determination by arbitrators selected by themselves or, at their option, appointed by the society, has as chairman of the electrical industry J. A. Hawks of the Monroe Lamp & Equipment Corporation, New York City, who calls attention to the possibilities, under the arbitration law now in force in the State of New York, of substituting arbitration for litigation. The purposes of the society, which numbers among its indorsers E. Donald Tolles, Charles L. Eidlitz and Arthur Williams, are briefly stated to be:

First—To conduct a campaign of education in promotion of the general cause of arbitration in all disputes and differences.

Second—To organize, equip and operate in New York City, and later in the larger cities throughout the country, tribunals of arbitration for the speedy, inexpensive and just determination of controversies and misunderstandings.

Third—To have enacted a uniform arbitration law in all the states of the Union and to encourage the insertion of an arbitration clause in all trade and industrial contracts.

## General Electric Sales Managers Hold Conference

A three-day conference of sales managers of the General Electric distributing jobbers was held this week, beginning Monday, at the Bridgeport factory of the company for the discussion of timely problems in merchandising and trades policies. J. O. Wetherby was conference manager.

# Brief News Notes

**Montreal Company May Build New Plant at Cedars Rapids.**—The Montreal Light, Heat & Power Company, Ltd., shows in its report for the year ended Dec. 31, 1922, earnings of 8.15 per cent on common stock as compared with 6.54 per cent in 1921. An additional unit at Cedars Rapids is planned to provide a further 40,000 hp.

**"Farthest North" Radio.**—The Canadian government, it is announced, is planning a chain of six radio stations extending into the Arctic Circle. Five of the stations will be in the Northwest Territories and another at Dawson. The stations on or near the Mackenzie River will be at Fort Smith, Fort Resolution, Fort Simpson, Fort Norman and Fort McPherson.

**United Light & Railways Company Makes Record.**—For the first time in its history the United Light & Railways Company of Grand Rapids, Mich., has crossed the twelve-million-dollar mark in its gross earnings for a twelve months' period, showing $12,029,187 for the twelve months ended Feb. 28, compared with $11,235,196 in 1922.

**Danville Has New Turbine.**—A new 7,500-kva. turbine was placed on the lines of the Danville (Ill.) Street Railway & Light Company on April 4. This 2,300-volt, 1,800-r.p.m. unit doubles the present station capacity. Additions are also being made to the substation which will bring its capacity up to 6,000 kw.

**Michigan Electric Light Association Helps Meter School.**—Co-operating with the Michigan Electric Light Association, the electrical engineering department of the University of Michigan gave a short intensive course for electric metermen from April 9 to April 14. All work was done in the electrical laboratories of the university, and the course was directed by members of its department of electrical engineering.

**Southern Canada Power Plans New Plant.**—It is announced that the Southern Canada Power Company has determined to construct a hydro-electric station of 30,000 hp. at Hemmings Falls, near Drummondville, Quebec, on the St. Francis River. This is to meet demands in the eastern townships of the province and to carry out existing contracts. The report of this company for the year ended Sept. 30 showed a constant growth.

**Iowa Meter Course Successful.**—The short course for electric metermen at Iowa State College, March 12 to 16, closed with the largest attendance in the five years of its history. The total attendance was 130, representing forty-nine counties and forty-eight power companies, and sixteen manufacturing companies were represented. The students were classified in four groups covering beginners, men of some experience, fully experienced men, and meter superintendents, local managers and others.

**Southern California Edison Earns 9.78 per Cent.**—The Southern California Edison Company reports for the year 1922 a balance available for common-stock dividends of $3,731,855, equivalent to a return of 9.78 per cent a share on the company's outstanding stock. This compares with $2,532,532, or 9.02 per cent, in the year 1921. On Dec. 31 the profit and loss surplus stood at $2,786,890, against $1,244,777 on Dec. 31, 1921. At the end of the last current year the current assets of the company were $10,768,827 and current liabilities $9,343,867, leaving a working capital of $1,424,960.

**University of Colorado Meter School.**—Among the many universities and colleges which have held or will hold short courses for electric workmen this spring is the University of Colorado, which held classes from March 19 to March 24 with the co-operation of manufacturers and public service companies. Lectures were given by experts and plants were visited. A heavy storm, blocking the railroads, interfered to some extent with the attendance, but so much interest was manifested notwithstanding that the university is planning to repeat the course next year.

**Shawinigan Company Shows Growth.**—The annual report of the Shawinigan Water & Power Company for 1922 gave its gross earnings at $4,629,641, an increase of $405,596 over 1921 and of $686,282 over 1920. Net earnings amounted to $1,597,283, an increase of $6,471 over 1922 and a decrease of $11,759 as compared with 1920. The company's assets grew by $1,200,000 as compared with the previous year. The Laurentide Power Company, which is associated with the Shawinigan, had profits of $670,806, a gain of about $100,000 over 1921 and of about $238,000 over 1920.

**Standard Gas & Electric Earnings.**—Complete figures of combined earnings of the operated public utility properties of the Standard Gas & Electric Company for the twelve months ended Jan. 31, 1923, show that net earnings for the period increased 13.79 per cent as compared with net earnings for the previous twelve months. This was accomplished on an increase of 7.47 per cent in gross earnings. The combined earnings of all the properties for the same period compare as follows:

| | Gross | Net |
|---|---|---|
| 1923 | $37,703,978 | $14,154,573 |
| 1922 | 35,082,274 | 12,438,685 |
| Increase | $2,621,703 | $1,715,888 |

**Farmington River Company Plans Two New Hydro-Electric Developments.**—Construction will soon begin upon two new hydro-electric plants on the Farmington River, near New Boston, Conn., for the Farmington River Hydro-Electric Corporation, recently organized under the laws of Delaware to develop energy in this section of Connecticut. One development will include three dams, reservoirs and a 4,000-hp. plant to operate under a head of 300 ft., and the other a dam, pipe line and station of 3,600 hp., operating under 150-ft. head. New Hartford and vicinity will be served.

**Interconnection in Iowa.**—The last link in the interconnection of all the properties of the Iowa Railway & Light Company, the Iowa Electric Company and the Iowa Falls Electric Company will, it is reported, be completed this season, when a high-tension transmission line between Nevada and Boone will be built. The line will be approximately 28 miles in length and will have steel towers and aluminum conductors. When it is completed it will tie Nevada in with the Cedar Rapids, Marshalltown, Boone, Perry, Grundy Center and Iowa Falls power plants and provide a complete circuit over the state.

**Sponsors for Standardization Appointed.**—Sponsorship for radio standardization has been assigned by the American Engineering Standards Committee to the Institute of Radio Engineers and the American Institute of Electrical Engineers jointly. This action was taken in accordance with the recommendations of the large representative conference called by the Bureau of Standards. Sponsorship for the standardization of engineering and scientific abbreviations and symbols has been assigned to the American Association for the Advancement of Science, the National Research Council, the Society for the Promotion of Engineering Education and the United States Bureau of Standards jointly.

**New Water-Power Stations in Italy.**—The first units installed in the power station in the Val Formazzo, on the southern slope of the Simplon, in Italy, have been put in operation. This station derives its power from the Tannino, a mountain stream, and mountain lakes afford reservoirs with a combined capacity of 15,000,000 cu.m. Power is transmitted over a 74-mile, 60,000-volt line to a transformer station at Novara. Another company has just put in operation a new central station at Temu, on the Lake of Avio. Storage capacity of the reservoirs which will supply the plant will be 18,000,000 cu.m. This station is built for five units of 11,000 hp. each, of which two have been installed. Energy is transmitted at 125,000 volts to San Polo d'Enza, whence it will be sent to the central stations of central Italy.

**Iowa Goes Down with Radio-Controlling Devices Still Intact.**—When on March 22, in Panama Bay, the old battleship Iowa was sunk by modern superdreadnaughts under the eyes of Secretary of the Navy Denby there went down the first full-sized radio-controlled ship. The Iowa had been previously stripped of all equipment except her boilers and engines, and there were on board only the ingenious radio-controlling devices which were operated from storage batteries. The large mass of batteries was kept charged by a Kerr turbine, which had been purchased by the Navy Department in 1912. Elec-

tricity has been rapidly coming to the fore in the operation and control of equipment on board warships, and the possibilities in the directing and controlling of a battleship from a distance entirely by radio have been shown to be great.

**Portland (Ore.) Company to Spend $5,000,000.**—Announcement was made at the annual meeting of the stockholders of the Portland (Ore.) Railway, Light & Power Company that $5,000,000 would be spent this year on the company's construction program. Construction expenditures during 1922 amounted to $3,525,832. The greatest single item of expense this year will be the construction of the first unit of the Oak Grove hydro-electric project, which will bring in to the city of Portland 25,000 kw. of electrical energy. No changes were made in the board of directors or the officers of the company. Reports submitted showed that the company has 3,700 stockholders, more than 3,000 of whom reside in the state. Net earnings during 1922 showed an increase of $252,340, or nearly 7 per cent over the net earnings for 1921. After deducting interest, operating expenses, taxes and other expenses from the 1922 gross earnings there was a surplus left of $955,364.

**European Radio Development.**—William Dubilier, president of the Dubilier Condenser & Radio Corporation, who has just returned from Europe, announces that some very interesting radio developments have taken place there, among which is a radio-control system for trains, developed by the Germans. It is installed on locomotives and gives a signal to the engineer which, it is thought, will help to avert collisions. A new means has been devised for generating high-frequency oscillations which, Mr. Dubilier says, is much cheaper and easier to build and maintain than tubes for high power and can be used for power up to 25,000 kw. He reports also developments in the direction of splitting oils making insulation or obtaining nitrogen from the air to permit commercial currents to be used in a city. Many large radio plants are now contemplated, one of which is to be installed in Egypt, and condensers are being designed for these installations which are almost as large as a dwelling house and which will cost about $100,000 apiece.

**Sioux City Company Links Up Twenty-two Towns.**—Electrical energy for the supply of twenty-two northwest Iowa towns was made available recently when new transmission lines of the Sioux City Gas & Electric Company went into service. This marks the first step in the expansion of the company's field, which will include approximately seventy-five towns in the vicinity of Sioux City. The towns served by the lines already opened are Le Mars, Merrill, Remsen, Marcus, Cleghorn, Meriden, Kingsley, Washta, Quimby, Alton, Granville, Sheldon, Boyden, Sanborn, Primghar, Archer, Orange City, Sioux Center, Pock Valley, Hull, Doon and Alvord. The furnishing of electricity to these towns by the Sioux City Gas & Electric Company closes three local stations, two at Le Mars and one at Sheldon, according to an announcement made by William J. Bertke, general manager of the company.

**Maine Water Power Commission Fails of Continuance.**—By refusing to sign a bill providing for the appointment of a Water Power Commission of five members, of whom one would be appointed by the Governor for one year, two by the Speaker of the House for two years and three by the President of the Senate for three years, Governor Baxter of Maine, whose obstructive water-power policy was referred to in these columns last week (page 883), has cut off the continuance of the present commission's activities, leaving the state without an organization for the express study of water-power resources and development. The bill was left in the hands of the Governor at the close of the biennial legislative session. The present commission has been at work on conservation problems since its organization in August, 1919, and has published much valuable material on these resources of the state. Opposition encountered by the Governor in many quarters to his views in favor of state development of water powers is believed to lie behind his action. In a statement issued by him the Governor said that the best features of the commission's work would be continued under arrangements not yet made public.

# Associations and Societies

**Contractors to Discuss Technical Subjects.**—At a recent meeting of the Elcetrical Contractors' and Dealers' Association of San Francisco, it was decided to devote a part of the time at the weekly luncheons of the association to discussion of technical electrical subjects by qualified members for the profit of the entire membership.

**American Association of Operating Engineers.**—The regular biennial meeting of the American Association of Operating Engineers will be held with the Central Georgia Power Company at Macon, Ga., on April 26 to April 28 inclusive. Besides business and discussions there will be visits to substations and cotton mills and a trip to Jackson Dam, on the Ocmulgee River.

**Cleveland Men Charter Car for Pittsburgh A. I. E. E. Convention.**—Interest even greater than usual in the spring convention of the Institute to be held at Pittsburgh next week is indicated by the fact that the Cleveland Section is arranging to charter a car to carry its delegates to the rival city. A descriptive booklet is to be prepared by the Pittsburgh Section, with contributions from the Westinghouse, West Penn, and Duquesne Light companies and the Carnegie Institute.

**Public Hearing of Power Test Codes at Montreal.**—During the spring meeting of the American Society of Mechanical Engineers at Montreal, May 28-31, a public hearing on the "Code on Instruments and Apparatus," chapters 1 and 2, dealing with general considerations and with the accuracy of measuring instruments and the test code for internal-combustion engines, will be held. Papers on hydro-electric development in Canada, material handling, fuel and other subjects will be read.

**New England Rural Lines Committee Enlarged.**—Increasing interest in the problem of rural lines extension has led to the enlargement of the rural-lines committee of the New England Division, N. E. L. A., from a one-man to a seven-man basis. The chairman is H. M. Parsons, Central Massachusetts Electric Company, Palmer, Mass., and the other members are G. S. Williams, Augusta, Me.; J. Brodie Smith, Manchester, N. H.; F. L. Lovett, Montpelier, Vt.; R. W. Mitchell, Agawam, Mass.; P. F. Hodgkins, Pawtucket, R. I., and D. Loree, Willimantic, Conn.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

American Institute of Electrical Engineers—Spring convention, Pittsburgh, April 24-26; annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Oct. 2-5. F. L. Hutchinson, 33 West 39th St., New York.

American Welding Society — New York, April 24-27.

American Association of Operating Engineers—Macon, Ga., April 26-28. H. C. Bristol, Alaco, Tenn.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

Nebraska Section, N. E. L. A.—Omaha, May 10-11. Horace M. Davis, secretary-treasurer.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

Empire State Gas and Electric Association, Electric Section—Utica, N. Y., May 17-18. C. H. B. Chapin, Grand Central Terminal, New York.

Electrical Supply Jobbers' Association—Executive committee and general meeting, Hot Springs, Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

Missouri Association of Public Utilities—River boat from St. Louis to Peoria, May 24-26.

American Society of Mechanical Engineers—Montreal, May 28-31. C. W. Rice, 29 West 39th St., New York.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

California State Association of Electrical Contractors and Dealers—Dorner Lake, Cal., June 9-16.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

North Central Division, N. E. L. A.—Minneapolis, June 13-15. H. E. Young, Minneapolis General Electric Company.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

Society for the Promotion of Engineering Education—Ithaca, N. Y., June 20-22. Dean F. L. Bishop, University of Pittsburgh.

Canadian Electrical Association — Montreal, June 20-23. Louis Kon, 65 McGill College Ave., Montreal.

American Society for Testing Materials—Atlantic City, June 25-29.

Associated Manufacturers of Electrical Supplies—New London, Conn., June 26-29.

National Council Lighting Fixture Manufacturers—Hot Springs, Va., June 26-28.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13. D. L. Gaskill, Greenville.

# Recent Court Decisions

**Nonsuit Wrongly Entered Where Young Child Was Injured Through Trespass.**—In Costanza vs. Pittsburgh Coal Company it was shown that defendant maintained in a lot where children were accustomed to play an electric transformer with connecting lines carrying 6,600 volts. This instrument was within an inclosure, 6 ft. x 8 ft., two sides of which were formed by a shed, the other two sides by wire netting 5 ft. high, with large meshes at the top. A six-year-old child gained access to the inclosure either over the fence or from the shed through a window and was severely injured by contact with the electricity. The trial court entered a nonsuit on the ground of trespass, but the Supreme Court of Pennsylvania has held that this order was improperly made, because of the extreme youth of the child, and has ordered a retrial to establish the negligence or otherwise of the company. (119 At. 820.)*

**Can One Company Sue Another to Prevent Invasion of Territory?**—An action brought by the Fulton Light, Heat & Power Company against the Seneca River Power Company to prevent the latter from selling energy in the city of Fulton, N. Y., hinged on the power of one public utility to sue another one for violation of a clause in the Public Service Commission law which forbids an electrical corporation to begin the construction of a plant or the exercise of franchise rights without first obtaining the permission of the state commission. The defendant company maintained that if the plaintiff had any grievance its legal remedy lay not in the courts but in action by the commission. In overthrowing this contention and continuing an injunction against the Seneca River Power Company, the New York Supreme Court based its decision on the fact that while the commission could take action on its own initiative in such a case, the law provided no means by which the aggrieved company could set commission proceedings in motion. (197 N. Y. S. 319.)

**Arkansas Railroad Commission Without Jurisdiction Over Electric Service Companies.**—The Railroad Commission of Arkansas having granted a certificate of convenience and necessity to the De Queen Light & Power Company to sell and distribute electricity in De Queen, the receiver of the Commonwealth Public Service Company, operating in the same city under an "indeterminate permit" issued by the defunct Corporation Commission of Alaska, brought suit in the circuit court and won judgment invalidating the commission's action. The Supreme Court of Arkansas, being appealed to (De Queen Light & Power Company vs. Curtis), has sustained the lower court, holding that the act empowering the Corporation Commission to grant public service corporations a certificate of convenience and necessity having been repealed by an act conferring jurisdiction on municipalities to regulate public service corporations operating within their limits and specifying the public service corporations over which the jurisdiction of the Railroad Commission, substituted for the Corporation Commission, shall extend, the Railroad Commission cannot grant such a certificate to a company distributing electricity in a city under franchise from it. (248 S. W. 5.)

**Common-Law Water Right Not "Franchise."**—In Southern Nebraska Power Company vs. Taylor the defendant appealed from a decision of the Nebraska State Railway Commission fixing the value of a water right held by the company against which it wished to issue stock. The company contended that the valuation as made was too low. The Supreme Court of Nebraska, declaring that in direct appeals to it from orders of the commission the orders will be reversed only where it affirmatively appears from the record that they are clearly wrong, sustained the commission. In answer to a contention made by the Attorney-General of the state that the water right was in the nature of a franchise and could not be capitalized, the court said that where a public utility corporation has succeeded to the common-law water-power right of a riparian owner and makes application to the commission for authority to issue stock against it, the statute prohibiting stock based upon franchise value does not apply. (192 N. W. 317.)

**Rights of Existing Companies Cannot Be Taken Away to Avoid Competition.**—An order of the Pennsylvania Public Service Commission prohibiting the Harmony Electric Company from supplying service in the borough of Ellwood City because the Pennsylvania Power Company had also charter rights in that borough led the first-named company to appeal to the courts against the commission. The Supreme Court of Pennsylvania has found that the law does not contemplate that a certificate of public convenience need be obtained by a company which was doing business within the territory covered by its charter at the time the public service company law became effective for each step taken in the advancement of its service within its unabandoned territory; that it is not necessary for an electric service company to obtain the consent of a borough before rendering service within the borough where no streets are to be occupied in rendering such service, and that the commission cannot, either directly or indirectly, take away from an electric service company which was in existence before the public service company act became effective any of its chartered powers which it had not forfeited, even though the exercise of such powers created a competitive situation which the commission desired to prevent. (119 At. 712.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Existing Utilities Desiring to Extend Service Are Not in Position of New Utilities Seeking to Enter Competitive Field.**—In granting to the Terre Haute, Indianapolis & Eastern Traction Company permission to operate as a general electric utility within the city of Indianapolis, the Indiana Public Service Commission, alluding to the footing gained in the city by the company through its supply of energy for railway operation and to certain manufacturers, said: "That being true, the situation is different from that of a proposed new utility desiring to begin organizing and investing capital for the purpose of entering this competitive field, because it had its capital invested and was rendering service some six years before the Public Service Commission act was enacted. As a light and power public utility and to that extent it is entitled to the same protection afforded by the scheme of regulation upon the same basis and for the same reasons as the other utilities operating within the field. . . . The law does not authorize existing utilities to prevent extensions to plants and service on the part of other existing utilities. If it were so, there could be no improvement of utilities if they restrained each other."

**Non-Operative Properties — Going-Concern Value—Power for Irrigation.**—In arriving at a valuation of the Idaho Power Company's property, the Idaho Public Utilities Commission held that property not now required for use in service and representing expenditures by predecessor companies, partly under the stress of competition, should be excluded from the rate base when the time at which service demands would justify the additional expenditure necessary to complete the property is uncertain. The going-concern value in the way of property development and business development of the company resulting from the reorganization of several precedent companies was determined by a consideration of the benefits resulting to the public, the difficulties of reorganization, service conditions and results achieved. Irrigation customers, the commission held, should not be charged with all of the investment represented in the generating and transmission parts of the system used for their service only a part of the year when that investment is not active all of the year around, nor should the carrying costs of the excess be charged to other customers; but the excess capacity in the system during the off irrigation months should be considered as not yet fully energized.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

### Dr. Hyde Resigns

Dr. Edward P. Hyde, who organized the Nela Research Laboratories in 1908 and who for the last few years has occupied the position of director of research of the National Lamp Works of the General Electric Company, has tendered his resignation, to take effect June 30 of this year. Dr. Hyde, who has been active in scientific and technical affairs for a number of years, has decided to take a prolonged rest abroad. He will temporarily discontinue many of his activities in the scientific and engineering societies, but will retain his office of president of the International Commission on Illumination until its plenary meeting, which is scheduled to be held in this country in 1924.

**H. F. Armstrong** of the Pennsylvania Power Company of Allentown, Pa., is now associated with the Georgia Railway & Power Company.

**H. B. Barnes**, consulting engineer of Denver, Col., is in charge of a hydroelectric power project in Hinsdale County which has been acquired by L. F. Hulen and associates from the Hinsdale Mining & Development Company and the Golden Fleece Consolidated Mining Company.

**F. C. Brown**, acting director of the United States Bureau of Standards, Washington, D. C., has been appointed a representative of the Department of Commerce on the American Engineering Standards Committee, succeeding S. W. Stratton, with E. C. Crittenden, chief of the electrical division of the bureau, as alternate.

**Dr. August Hund**, recently of the University of California, has been appointed an additional electrical engineer of the radio section of the United States Bureau of Standards. Dr. Hund was graduated from the Technische Hochschule, Carlsruhe, in 1911 and took the degree of doctor of engineering in 1913. He was employed by the General Electric Company under Dr. Steinmetz in 1915-17 and since that time has been doing graduate work at the University of California.

**S. P. MacFadden**, formerly secretary in the Texas district office of Stone & Webster, Inc., has been transferred to Port Arthur as superintendent of the Eastern Texas Electric Company, succeeding Joseph Bowes, who has been made general light and power superintendent of the company with headquarters at Beaumont. F. C. Taylor, formerly chief engineer of the Eastern Texas Electric Company, has been appointed superintendent of power stations.

**Dean J. Locke**, who has been associated for some years with Prof. Albert S. Richey of the Worcester (Mass.) Polytechnic Institute in consulting engineering activities and investigations connected with rate cases, has joined the staff of the Public Service Railway, Newark, N. J.

**Dean Gardner C. Anthony** of the Tufts College (Mass.) Engineering School, sailed April 19 for an extended European trip. Dr. Anthony is the founder of the New England Section of the Society for the Promotion of Engineering Education and is its present chairman. He will return about Sept. 1.

**Frank A. Easton**, formerly head of the gas department of the San Joaquin Light & Power Company at Bakersfield, Cal., has been promoted to the position of stock sales manager with headquarters at Fresno. His place as head of the gas department in Bakersfield has been taken by William Tyler, formerly his chief assistant.

**Thomas J. Hanlon, Jr.**, manager of the Tampa Electric Company, a Stone & Webster property, has been made manager of the Winter Haven (Fla.) Water, Ice & Light Company, recently acquired by Stone & Webster. J. H. Fuller, formerly sales manager of the Tampa company, will be assistant to the manager with headquarters at Winter Haven, and Gettis B. Henderson will take Mr. Fuller's place as sales manager of the Tampa company.

**W. E. Clement**, commercial agent of New Orleans Public Service, Inc., was elected president of the Electrical League of New Orleans on April 9. Mr. Clement is an enthusiast on all matters electrical and has taken an active part in the growth and welfare of the league. Percival Stern of the Interstate Electric Company was elected vice-president, and C. A. Disher of the Electric Appliance Company was elected secretary and treasurer.

**Tom P. Walker**, formerly manager of the Haverhill (Mass.) Gas Light Company, has been transferred to the managership of the Baton Rouge (La.) Electric Company. J. L. Alexander, manager of the Keokuk (Iowa) Electric Company, has been transferred to Haverhill, and Walter H. Burke of the Boston office of Stone & Webster, Inc., has been appointed manager of the Keokuk company. Roger A. Gordon, formerly sales manager of the Houghton County Electric Light Company, Houghton, Mich., and later of the Paducah (Ky.) Electric Company, has been appointed sales manager of the Blackstone Valley Gas & Electric Company, Pawtucket, R. I., succeeding E. S. Roberts, resigned.

### PenDell and Sedgwick Made Executives' Assistants

C. W. PenDell has been made an assistant to Vice-president John G. Learned of the Public Service Company of Northern Illinois, and H. P. Sedgwick has been appointed an assistant to Vice-president J. L. Hecht. Mr. PenDell has been associated with the Edison Electric Illuminating Company of Boston, the Chicago & Northwestern Railroad, the Atchison, Topeka & Santa Fé Railroad and the North Shore Electric Company, and for some years was an engineer in the contract department of the Public Service Company, the successor to the North Shore company. Mr. Sedgwick has been associated with the company since 1913, when he became assistant inspector. In 1921 he was made superintendent of District "E" and one year later was transferred to Chicago as a member of Mr. Hecht's personal staff.

**S. C. Bleckley** of the Westinghouse Electric & Manufacturing Company of Pittsburgh is now associated with the engineering department of the Georgia Railway & Power Company.

**S. D. Woodward**, manager of the Peshtigo & Oconto Service Company in Peshtigo, Wis., has tendered his resignation to the Northeastern Power Company, which recently assumed ownership of the local plant. Mr. Woodward was for many years affiliated with the Peshtigo Lumber Company, and when it ceased activities he was one of the promoters of the company which purchased the electric holdings. He has no plans for the future at the present time.

**Lewis Degen**, consulting electrical signal engineer of Berkeley, Cal., has been retained by the city of Los Angeles to supervise the installation of a fire-alarm system, to cost $1,500,000. Mr. Degen spent many years in South America and installed the first electric street railway on that continent in Rio de Janeiro in 1890. Later he acted as consulting signal engineer for the Brazilian government for eight years. He returned to the United States in 1913 and in 1914 prepared plans for a fire-alarm system for Los Angeles.

**Harry B. Joyce** has been appointed manager of the synchronous-motor department of the Ideal Electric & Manufacturing Company, Mansfield, Ohio. Mr. Joyce was at one time affiliated with the United Railway & Electric Company of Baltimore, handling substations, test, designs and reconstruction, and was later appointed power engineer for the United Electric Light & Power Company, New York City, in charge of all commercial power sales work, developing power applications and handling and developing new and adaptable high-tension rates. Mr. Joyce has also been consulting engineer of New York City, devoting special attention to application of electric drive for ice-making and refrigerating plants.

**John D. Goodliff** was recently elected vice-president of the Parr Electric Company, Inc., New York City.

**Arthur P. Amond** of Green Bay has succeeded George Martin as manager of the Denmark (Wis.) Light & Power Company. Mr. Martin has been manager for the past five years.

**Floyd Casler**, formerly manager of the Midland Public Service Company in Colby, Wis., has been transferred to the company's branch at Blair to serve in the same capacity.

**Walter E. Burke** of Boston has been made manager of the Keokuk Electric Company, succeeding J. L. Alexander, who leaves for Haverhill, Mass. Mr. Burke is a member of the Stone & Webster organization.

**H. L. Mode**, who until recently has been electrical engineer in the chief engineer's office of the Otis Elevator Company, is now in charge of sales for the Hoist & Crane Engineering Company of New York City.

**Emerson A. Armstrong**, formerly power salesman of the Joliet district for the Public Service Company of Northern Illinois, is now in the Chicago office as power engineer in charge of all power salesmen of the company.

**G. M. Pierce** of Blair, Wis., has been assigned to the Menomonie office of the Wisconsin-Minnesota Light & Power Company as district manager. Mr. Pierce has been manager of the Blair district for the last eight months.

**Kenneth A. McIntyre** of the field staff of the Society for Electrical Development has returned to headquarters after a 9,000-mile trip. Mr. McIntyre looks for a year of progress in co-operative work that will be of lasting benefit to every branch of the industry.

**L. U. Murray**, manager of the Columbus (Ohio) office of the General Electric Company, has been appointed district merchandise manager of the Cincinnati district and is succeeded by J. A. Davies as manager of the Columbus office. Mr. Davies was general salesman in the Indianapolis office until his recent appointment.

**Ray P. Jackson**, manager of the materials and process engineering department, and Marsden H. Hunt, ceramic engineer, of the Westinghouse Electric & Manufacturing Company, will have charge of the new high-voltage insulator plant of the Westinghouse company at Emeryville, Cal., near San Francisco. The plant is now under course of construction and will be completed and operating in a few months.

**B. E. Sunny**, chairman of the board of the Illinois Bell Telephone Company, was elected a director of the Middle West Utilities Company at the stockholders' meeting at Wilmington, Del., March 27. Mr. Sunny's appointment was made to fill the vacancy created by the death of Frank J. Baker. John F. Gilchrist, vice-president of the Commonwealth Edison Company, was elected a member of the executive committee.

**Arthur L. Williston**, for the past thirteen years principal of the Wentworth Institute, Boston, and widely known by New England electrical men, has resigned. He was formerly connected with the school of science and technology at Pratt Institute, Brooklyn, and during the war was educational director for New England army training detachments, having charge of military training departments in fourteen institutions.

**George F. Staal**, city engineer of Milwaukee for the last nine years, has handed in his resignation to the Mayor, to become effective at the expiration of his term on April 17. Mr. Staal will leave Milwaukee to become associated as chief engineer and general manager of the Pike Forest Development Company, in which he is personally interested, with offices in Denver. This company will carry on extensive construction and water-power work in Colorado.

**Col. Frank M. Gunby**, consulting engineer with Charles T. Main, Boston, has been elected president of the Boston Society of Civil Engineers. Colonel Gunby is well known in electrical circles and has been in charge of the Boston branch of the Main organization's work for some years. He has been active in hydro-electric and industrial-plant engineering. During the war he was stationed at Washington, D. C., in charge of engineering in connection with the construction of cantonments throughout the country.

**P. H. Gadsden** of Philadelphia has been nominated as a director from election district No. 2 on the board of directors of the Chamber of Commerce of the United States by the National Electric Light Association, the American Electric Railway Association, the American Gas Association and the Natural Gas Association. Mr. Gadsden is vice-president of the United Gas Improvement Company and is vice-president and one of the directors of the Philadelphia Chamber of Commerce. The election will be held at the time of the annual meeting of the chamber, May 8, in New York.

**Willis H. Booth**, vice-president of the Guaranty Trust Company of New York, was elected president of the International Chamber of Commerce at its convention in Rome on March 24. In addition to his banking activities, Mr. Booth has many large and important industrial interests. In 1910 he established the Hotpoint Electric Heating Company, which was later merged with the Hughes Electric Company and the electric heating division of the General Electric Company under the name of Edison Electric Appliance Company, with factories in California, Chicago and Canada. He is chairman of the board and of the executive committee of this corporation.

**David Elwell** has been appointed manager of the New York office of Lockwood, Greene & Company, succeeding Gen. W. H. Rose, who has resigned to join the organization of the American Machine & Foundry Company, New York. Mr. Elwell is well known in electrical circles, having been graduated from the Massachusetts Institute of Technology in 1904 and served with the Edison Electric Illuminating Company of Boston and the Westinghouse Electric & Manufacturing Company, representing the latter as superintendent on the electrification of the New York, New Haven & Hartford Railroad. For five years he was electrical engineer of the Boston office of Lockwood, Greene & Company, going to New York in 1920.

**W. F. Hendry** has resigned his position as assistant chief engineer of the Western Electric Company to become chief engineer of the Manhattan Electric Supply Company. Mr. Hendry had been associated with the Western Electric Company for almost twenty-three years.

**H. T. Melhuish**, formerly manager of the district sales office of the Radio Corporation of America at Chicago, has been appointed assistant general sales manager at the company's New York office. Mr. Melhuish had been associated with the Radio Corporation for only three months as salesman when he was selected for the position of district sales manager at Chicago. Previous to his connection with the Radio Corporation he was engaged in radio distribution in New York City in his own interest. For five years Mr. Melhuish has been active in radio sales work. J. M. Sawyer, who was responsible for the organization of the Radio Corporation of America district sales office at Chicago, has returned from the San Francisco office to become again sales manager of the Chicago office. Mr. Sawyer has just completed organizing the San Francisco sales department.

# Obituary

**Horace O. Stone**, lawyer and inventor, died on April 11 at Chicago after a stroke of apoplexy. Mr. Stone invented a glass device to prevent damage by freezing of water in engines and methods of effecting saving in blast furnaces.

**Fred S. Martin**, superintendent of the large industrial motor department of the Westinghouse Electric & Manufacturing Company for a period of eleven years and subsequently appointed staff superintendent, died recently in the West Penn Hospital, Pittsburgh, after three weeks' illness.

**Hanson M. Savage**, president of the Wetmore-Savage Company, Boston, and one of the best-known electrical supply jobbers in the East, died suddenly at Boston on April 10. Mr. Savage, after some years in the service of the General Electric Company, formed, in 1906, with V. C. Bruce Wetmore, the company bearing their names.

**Thomas E. Crossman**, who had served the National Electric Light Association, the American Institute of Electrical Engineers and the Association of Edison Illuminating Companies for almost forty years as official reporter, died suddenly on April 4 in the Congress Hotel, Chicago, where he had gone to report the meeting of the American Railway Engineering Association.

## A Method of Selecting Men

### A Simple Form of Question Test—Policies Toward Education, Habits and Entertaining—Other Practical Points

By R. J. Russell
Vice-President Century Electric Company, St. Louis

THERE are three things, we feel, that should be very carefully determined in the case of every man who is permitted to join our organization. We try to make sure of every man who enters our employ:

First—That he shall be a man of character, one who has had good home and social and educational training and has absorbed and not forgotten it.

Second—That if he does not possess the knowledge to enable him to handle the engineering end of the commercial and sales problem he will have the fundamental education that will enable him to "know how to find out."

Third—That he has made up his mind to continue indefinitely with us if he is to join our commercial organization.

I might elaborate on this at length, but, briefly, we are not attempting to operate in a corrective fashion, but rather definitely to develop ability, which is apparently quite possible.

R. J. Russell

#### As to Habits

We find it is best to select men who have inherited something that will be of substantial assistance in their business life. We are interested particularly that the man has been inclined to participate and has participated in society and organization work, which broadens a man's views and gives him a little confidence in himself. We are particular as to how he spends his Sundays, Saturday afternoons, holidays and evenings, and, if he is married, we want to know whether he spends them with his family or not.

Our experience shows that when the diversion indulged in by an individual after business hours, or the lack of physical and mental relaxation, leaves him in the position of, consciously or unconsciously, using the morning (especially Monday) to recuperate, he is not generally able to contribute that concentrated thought and determination to his business, or promptly to render the decisions which are required, that will enable him to keep up with those who are forced by the demands of the work to secure definite results. As a general proposition, he can hardly be considered as headed for the ultimate position of substantial responsibility and trust which we are hoping all will be qualified to fill if or when it is offered.

#### As to Education

We are not placing any one in a position above an ordinary clerkship in our commercial and sales organizations who does not possess a college education. Those who have acquired a technical education outside of a college are generally a little older than we find economical to try to break into our ways. They cannot so readily understand and absorb our practices and policies. We must have technically trained men, otherwise we would not possess the man who "knows how to find out" when he does not know the answer to the question or problem that is given him to solve. For many other departments in our works the standard practice is to hire college men; but elsewhere also, in the majority of cases, those who expect to rise above the point of workmen must have at least a high-school education.

In hiring men for our commercial organization we want them as soon after they come from college as possible, so that we may train them with the minimum effort to believe in and observe the plans and practices and policies of the Century Electric Company and so that they may feel they are an inherent part of the organization.

#### Analyzing Character

In examining men for employment in our commercial organization we require them to answer a series of very exacting questions, which we study with close scrutiny and find extremely helpful in analyzing character and weighing the value of a man to us. We secure a frank statement on the following points, different application forms being used for different departments:

1. Age.
2. Where have you lived, and the number of years spent in each place?
3. Father's or guardian's business now.
4. Nationality.
5. Descent.
6. Height.
7. Weight.
8. Supply late photograph with this record.
9. Physical defects.
10. Married or single?
11. Number of children.
12. Do you smoke cigarettes?
13. Do you use alcoholic liquors in any form?
14. Schools attended, name and location, course, how long, year graduated, degree: High school, preparatory, college, university, technical.
15. What manual training have you received at school?
16. Mention the most important studies you have taken in high school and university and have received satisfactory credits for, also studies you liked best.
17. What was the subject of your thesis upon graduation?
18. School work enjoyed most.
19. Scholarship record (your own opinion).
20. Scholastic honors.

21. Part taken in athletics, class organization, students' societies, etc.—offices held.
22. What societies are you a member of—educational, social, religious, fraternal, etc.—and what part taken in each?
23. All practical experience, including remunerative work during vacations or high school and university periods in order of date.
24. What experience, if any, have you had in selecting and applying motors for and to installations and apparatus?
25. If not answered above, what knowledge have you of single-phase and polyphase motors and fans, both theoretical and practical, and where did you acquire it?
26. Detail your sales experience if any.
27. Outline the division of engineering which you most desire to follow—factory, production, design, sales.
28. What languages have you studied?
29. What languages do you speak (state whether fluently or partially)?
30. Detail your connection with Century Electric Company.
31. Are you ready to go anywhere in the United States that we may designate?
32. State the particular line of work and class of apparatus, if any, on which you are now or have been making a specialty.
33. Name and address of firm with which you are connected at present, and your position.
34. Are you seeking temporary or permanent position?
35. Why do you wish to become connected with Century Electric Company?
36. Per cent college expenses earned.
37. Present financial obligations.
38. How do you spend your evenings?
39. Mention some of the books and magazines you have read during the past year.
40. General remarks bearing on your application that are not covered elsewhere herein that will help in arriving at a just decision as to whether to engage your services or not.
41. General impressions of interviewer: Appearance, approach, attitude, breadth, character, decision, expressiveness, enthusiasm, health, judgment, personality, quickness, refinement, tact, work best suited for.

A Few Requirements

Among our requirements are that the man must stand at least 5 ft. 8½ in., weigh not less than 140 lb. and be not less than twenty-two years of age. He must not smoke cigarettes or use intoxicating liquors. The Century Electric Company has never since it was organized allowed five cents for entertainment. The reason is that we expect our men to compete for business but not to compete in any "cafe endurance" contest, which in practice results in the salesman trying to entertain a different guest at least once a day. If we did not establish this rule, our salesmen would be worn out physically about the time they should amount to something to themselves and to us commercially.

We have no place in our organization for the man who is looking for experience, and we are particularly careful in selecting men in seeing that they take their time to investigate our company and our organization from all angles. We suggest many of the angles from which they do their investigating, being sure that we are not at all biased, so that when a man does come with us he is practically certain to stay.

As far as we can recall, no man connected with our sales organization who was technically educated and trained in our works and in the general office has left and gone with a competitor, except one case. A family reason caused that decision.

Our educational department consists of an educational director and an assistant director, who preside over our student employees, and an assembly room seating about 150. These men are looking after the routing through the works of from six to fifteen college men, from fifteen to fifty high-school graduates destined for foremen, clerical and directing positions, and from twenty to thirty young workmen apprentices all the time.

# Wanted: More Open Minds

### More Liberal Co-operation Needed from the Trade in Marketing New Electrical Conveniences

By a Manufacturer's Sales Engineer

Some years ago there was developed an electrical household convenience which was designed for usefulness in the kitchen, and now a company with which I am connected is trying to market this device. We manufacture no other household products, but are hoping to build up a sound and extensive business through the successful application of this equipment in many parts of the country. Why does the progress of this appliance make such moderate headway?

When intelligently applied to kitchen requirements, this device does its work better than the older competitors operated by other agencies than electricity. Yet it is like the proverbial " pulling teeth" to get the local central-station sales department executive interested in its application, and we find it almost as hard to arouse the electrical supply jobber and the dealer to the possibilities of its proper utilization.

Not only because I am personally interested in seeing this device take its place among recognized standard equipment for the home do I appeal for more co-operation. Every manufacturer of a comparatively new device will appreciate the difficulties of interesting the utility man, the jobber and the retailer in a modest piece of equipment like this, selling for far less than $100 in a common size, and requiring only the will to push it to insure popularity. I suppose that the trouble lies in part in the idea of many executives of central stations that the device in question is attacking a field of service which has often been looked upon as barren to commercial exploitation. It is unnecessary to state what this service is in order to make the point I wish to drive home, viz., that the men of this industry should never "freeze" to the conclusion that because some problem has been unsolvable it is bound to continue so.

So widespread is this impression among many central-station sales managers, for instance, that it is difficult to get complete trial installations on their own systems, and yet now and then one or another utility executive will put the outfit into his home, "try it on the dog" as it were, and then some day Mr. Sales Manager finds out that the "big boss" has one of these things under his own roof, that it works properly, and hence that it will work elsewhere. It ought not to be the case that the easiest avenue of approach to the sales manager in the lighting company or the jobbing establishment is sometimes via the "overhead" route passing through his superior's demesne.

So I ask that sales leaders throw their minds a little wider open in considering and trying new electrical devices; that they refrain from the error (centuries old) of supposing that because a scheme failed to work years ago, it is no good today. We, for instance, offer them a device which will do better work than its competitors made outside the electrical industry, and I frankly believe that a greater willingness to give such apparatus a more comprehensive try-out will be productive of good to the industry and to the waiting public.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

WITH the increasing demand for motors in various parts of the country, heavy pressure is being put on manufacturers to meet present requirements, and the time has now come when prospective purchasers will have to reckon on lengthening deliveries on orders involving even fair-sized total ratings of the more common machines. Experience of many years has shown manufacturers the wisdom of "long-distance" production and of the upbuilding of local stocks for the more immediate demands of the market, and at present a vigorous effort is being made to complete and maintain at least moderate stocks of the smaller integral-horsepower motors. A buying movement has begun to set in in some quarters in anticipation of possible price advances. It may fairly be said that many motor stocks are spotty, taking the country as a whole; but thus far no serious inconvenience appears to have been sustained from the fact that these stocks are being reduced, notwithstanding 100 per cent capacity output in representative plants.

## Competition Is Still Acute

IN SOME circles the opinion is still heard that competition is an adverse factor in the motor business, particularly in regard to margins of profit allotted to sales representatives. While it is true that there are a great number of motor producers in the field at this time, it is felt in some quarters that the real test of business-getting capacity is service. As stocks diminish, the sharpness of competition tends to increase; but the line of best results in building and maintaining a motor business appears to be that of intelligent application engineering and modern sales facilities, with all that these mean in the way of gaging requirements and holding interest in performance after sales.

## Betterment Work Never Stops

LOOKING into the distant future of the electrical industry, it is still impossible to discern a zone of complete saturation in motor applications in this country. Not only do the natural and still undeveloped resources of America beckon the motor builder to new achievements, but the constant changes in industry and the progress of application engineering are continually pointing the way to new sales. Transformations of war-material plants into establishments devoted to the production of other kinds of commodities have been completed in many localities. A great machine-gun factory is today turning out fuses, switches and other distribution material. Another is making electric starting and lighting systems for the automobile industry. Revolutionary changes in motor installations have gone along with such transitions, and the ceaseless fight against industrial waste takes close note of load variations in many plants whose product has not been changed in kind, although it has in quantity, during the past five or ten years. The immense stocks of used motors thrown upon the market at the close of the war have been absorbed into industry with slight effect upon prices as a whole, and the progress of new designs has stimulated interest in power problems throughout the trade.

## Record-Breaking Sales of Heating Pads Are Reported

AN UNPRECEDENTED demand for heating pads during the past four months has led to a marked increase in production in factory circles, and this has been sustained throughout the winter without the usual seasonal slump in orders. Some overtime work is necessary to keep up to the current volume of business, and it is impossible to build up any substantial stocks under present conditions. The supply of raw material for pads is reported ample as a result of manufacturing anticipation of requirements. The care required to produce reliable and satisfactory pads makes it necessary to build up factory forces gradually for such work. Labor is in fairly good supply. Prices are firm and little prospect of early change is evident. This class of equipment is rapidly getting into the staple line, and vigorous advertising effort, coupled with an unusually severe season in the northern part of the country, has contributed to the present satisfactory situation.

## Range Business Hitting Faster Stride as Spring Sets In

IMPROVEMENT in the electric range trade is in general evidence as spring demand opens wider. Manufacturers are increasing their production schedules and look for a substantial year's business. So far few complaints of labor shortage have found wide circulation, and raw materials are in fair supply for current needs. There is some prospect, however, of material scarcity before the end of summer. Deliveries are in good shape and the trend of prices is upward in some quarters. A great deal of study is being given to the marketing of electric ranges by both manufacturers and central stations. The growth of installment campaigns in central-station circles is helping to popularize electric cooking, but the full benefits of mass production have not yet been attained in the manufacturing plants. New England is rather apathetic at the moment as to range purchases, but the Far West and the South are showing new interest, and both inquiries and purchases are coming in at a much faster rate than a year ago. The central-station rate situation is getting better constantly, from the manufacturer's viewpoint. The continued high cost of domestic fuel and the improved automatic and convenience features which different range makers are developing are bringing the range home to the public in a more definite way than formerly.

## Conduit Boxes in Easy Supply

JUDGING from reports of Eastern distributors, any troublesome delays in the transportation of conduit boxes which were experienced during the winter have given way to an ample supply. Steady sales are being handled in connection with the building expansion program of the country, and prices are unusually free from violent fluctuations. The ups (and downs that were) of black and galvanized pipe quotations find little reflection in box prices.

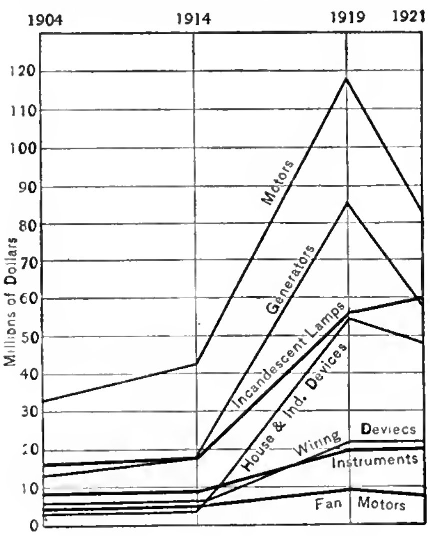
An intelligent attention to future requirements is, of course, necessary in handling this class of material, but so far the steel industry has given the jobber and the contractor very little trouble in relation to a fairly even stock maintenance in local centers from which the supply of conduit boxes are distributed.

## Purchasers Help Transformer Standardization

RECOGNITION by the transformer manufacturers of the co-operation of purchasers in standardization work is a gratifying sign of mutual understanding. Few buyers of transformers are perhaps in a position to contribute directly to the progress of engineering design in this field, but the willingness of more and more users to adapt their requirements to well-considered established types and ratings of equipment is helping to reduce superfluous production and so to keep down costs in a broad sense. A leading transformer engineer stated last week that plant and system operators have shown about as much active interest in standardization as the manufacturers, the collective result being along the line of elimination of undue variations from established equipment in specifications. Some operators may at times call for special combinations wherein a standard rating can be made to satisfy their needs, and each time that the decision is made to play the standard game the industry receives some benefit. All signs point to a continuance of this co-operation, and publicity on the part of operators and manufacturers is helpful to the cause.

## Chart Shows Some Interesting Production Values

ACCORDING to recent official figures by the Department of Commerce, the 1921 value of motors and parts, not including starters and controllers,



IMPORTANT 1904-1921 VALUES

amounted to $83,058,000; generating apparatus and parts, $58,861,000; incandescent lamps, $59,728,000; household and industrial devices, $48,815,000; wiring devices, $21,806,000; instruments, $21,033,000, and fan motors, $8,611,000. Production values for the census years 1904, 1914 and 1919 are indicated as shown in the accompanying chart.

## Industrial Electric Trucks Are in Better Demand

IN BOTH proposition work and sales manufacturers of industrial electric trucks are enjoying decidedly increased activity, following a long period of comparatively dull business. The effective use of these labor-saving equipments depends fundamentally upon the existence of a volume of material handling sufficiently large to keep them occupied a large portion of the working day, and in times of business depression industrial plants tend to become overequipped as well as overmanned. Sales of trucks at such times are consummated only with difficulty unless the economic balance in favor of the truck is so marked as to rebuke the intelligence of the purchaser who fails to substitute it for man-power.

## Truck Sales Start Other Equipment

EQUIPMENT of this type is again in demand to help solve the problems of internal transportation in factories and yards, on docks and at important railroad terminals. A projected new railroad terminal or union station may open a market for two dozen mail and baggage-carrying types, and labor shortage and high costs are turning the attention of specification writers in designing engineers' offices concerned with the above work to industrial truck requirements. Along with these comprehensive layouts for service of trucks in small fleets go demands for the latest types of battery-charging equipment, with a tendency toward the use of automatic control panels and an increased number of energy-recording instruments. The marketing of such equipment is essentially engineering salesmanship, and while competition among the dozen or so representative truck makers is active, the decision to buy particular units rests upon many other conditions than price. Present activity in this line is a most encouraging index of industrial prosperity.

## Manufacturing Industry Had 5.16 per Cent Labor Shortage

EXTENSIVE survey of the labor supply situation has just been completed by the National Industrial Conference Board. The object has been to establish whether labor shortage exists, and, if so, how much of a shortage and in what industries and where.

In the electrical manufacturing industry the board states that the March employment index number (July, 1914, equals 100) amounted to 147.7; that the total per cent of unfilled positions to the total employment of all firms in the electrical industry, as of March 15, was 4.72, and that the percentage of unfilled positions to employment in firms reporting shortages amounted to 5.16. Information from 1,011 firms in various parts of the United States, employing 369,405 wage earners and selected from practically every line of industry, it is stated, shows that there existed a labor shortage amounting to 2.5 per cent of the total employment on March 15. Of the firms reporting, 315 stated that they had unfilled positions due to inability to secure workers. These 315 firms employed 175,387 wage earners and could have employed 9,800 additional persons on March 15, according to the survey.

## February Electrical Exports Heavier than in 1922

TOTAL exports of electrical machinery, apparatus and appurtenances for the month of February were $4,839,738, a gain of $454,344 over February, 1922, when the total amounted to $4,385,394. The following figures are supplied by the Bureau of Foreign and Domestic Commerce:

ELECTRICAL EXPORTS FOR FEBRUARY, 1923, COMPARED WITH CORRESPONDING PERIOD A YEAR AGO

| Articles | Value February 1922 | 1923 |
|---|---|---|
| Electrical machinery, etc. | | |
| Turbines | $228,483 | $57,084 |
| Generators: | | |
| Direct-current— | | |
| Under 500 kw | 26,565 | 60,710 |
| 500 kw. and over | 11,962 | 114,726 |
| Alternating-current— | | |
| Under 2,000 kva | 11,302 | 23,926 |
| 2,000 kva. and over | 49,624 | 102,946 |
| Accessories and parts for generators | 18,412 | 20,523 |
| Self-contained lighting outfits | 22,498 | 25,972 |
| Batteries: | | |
| Primary | 72,243 | 98,073 |
| Storage | 85,363 | 182,454 |
| Transforming and converting apparatus: | | |
| Transformers— | | |
| Power | 231,431 | 280,135 |
| Other | 119,397 | 38,418 |
